By the end of 1966, with the aid of *tatsepao*, over 250 leading editors, propagandists, and leaders of the arts had been removed from their posts,¹¹ including men who had held key positions within the party since the hard days of Yen-an before the Second World War.

EARLYWORD

By the EDITORS

A key concept behind Earlyword was that using recently captured or surrendered personnel to appeal directly to former comrades would enhance the timeliness and therefore the credibility of the message.

Vietnam proved no exception to the problems associated with the PSYOP targeting of swiftly moving adversaries. Reaching the audience with credible appeals was often futile in tactical PSYOP unless the messages were timely. The Allied quick-reaction capability was poor—especially early in the conflict—largely because of a lack of understanding of, or an inability to meet, the basic conditions for effective combat propaganda. Often, the problems began with the exploitation of recently captured enemy soldiers.

Particularly in the early stages of American involvement in Vietnam, the typical priority was to exploit a captive for battlefield intelligence. Even if the prisoner were captured by American elements, he usually

was turned over to the Vietnamese National Police or ARVN who interrogated him for a lengthy period. After the interrogation period, the captive was placed in a camp with other prisoners. There, the prisoner could learn from fellow inmates the words and actions that would be most likely to elicit the desired responses from his captors. By the time psyoperators were able to take their turn at interrogating him, the prisoner was usually "stale," particularly from a tactical vantage point: He might no longer know where his former unit was operating; he would be less aware of the prevailing mood and dispositions of even his closest comrades; and he was likely to be influenced in his responses to questions by a modified state of expectations, in part learned from fellow prisoners. In many critical respects, then, the captive was no longer "typical" of even his closest former comrades.

"Earlyword" was an Air Force-devised system with the objective of enhancing the Allied tactical propaganda capability. The captive would speak into a standard military ground radio and the voice appeal would be picked up and broadcast on either live or delayed basis through the Earlyword's 1800-watt speaker system as the aircraft circled the location of the enemy unit. With the introduction of Earlyword in 1969, it became possible for a *Hoi Chanh* (rallier) in Allied hands on the ground to speak directly to his former comrades within minutes after rallying. No single technique can assure effectiveness, but Earlyword at least significantly increased the timeliness of tactical PSYOP.

POSTAL SUBVERSION*

BY MICHAEL CHOUKAS

Stamps can be an effective medium of communication. In this case, the attempted counteraction helped broaden the potential audience.

Not all groups are equally accessible to a propagandist; nor can they be reached by the same means. The group to be manipulated may be an enemy group, a neutral one, or the propagandist's own group, perhaps even a subgroup within these groups. Facilities of communication will differ from group to group, and so will other aspects of group life such as values, predispositions, current problems and issues. The questions that propagandists will have to answer are: How accessible is the group? What is the best way to contact it? And how can manipulation of it best be pursued? The answers, naturally, tend to differ from case to case.

Take our desire to reach those behind the Iron Curtain. Access to those people through the modern media of communication has been denied to, or made most difficult for our propagandists, both official and private. However, the latter did succeed in overcoming such obstacles and estab-

*Excerpts from *Propaganda Comes of Age*, Public Affairs Press, Washington, D.C., 1965. Reprinted with the permission of Public Affairs Press, copyright holder.

lishing a sort of psychological "beachhead" across the Iron Curtain by utilizing channels that were still open. In the press one reads, for example:

HUNGARY PROTESTS POSTAL "SUBVERSION"

Budapest, March 8 (AP). The Foreign Ministry protested to the United States and Canada today over the cancellation marks of stamps of letters received in Hungary.

The postmarks were illustrated in the Communist newspapers *Nepszabadsag*. The one from the United States said "Support your Crusade for Freedom." The Canadian envelope bore the legend "Pourquoi attendre au printemps (Why wait for spring?) Do it now."

"What else does that imply," the newspaper asked, "but the most outspoken, in fact amazingly unconcealed interference in the domestic affairs of another state?"¹

From another newspaper account,² one learns that the permission to have the "Support Your Crusade for Freedom" postmark used by the Post Office Department for a specified time (January 1 to March 31, 1957), was officially granted to the Crusade for Freedom organization, a private group supporting Radio Free Europe and Free Europe Press; also, that "The organization (Crusade for Freedom) has been denounced by the Soviet Union on the ground it is trying to incite subversive activity within Communist countries."

Our propagandists not only managed to send their message to the Hungarian people but, by the counteraction they aroused, they succeeded in having it spread widely among other people as well. The Communists were in fact shortsighted in giving the message such wide publicity. They apparently did forget a basic maxim of successful propaganda, not to argue the opponent's case in public.

MAINLAND POUNDED BY BALLOONS

IN PSYCHOLOGICAL WARFARE*

An old technique of message dissemination is vigorously used by the government of the Republic of China.

The Psychological Warfare Department of the Defence Ministry disclosed in Taipei recently that the government has sent 101,614,528 balloons to Mainland China in the past seventeen years.

The load carried by these balloons ranges from 35 grammes to 4,763 grammes. The two large-sized balloons, measuring 10 x 13 feet and 10 x

*Excerpts from the *Cosmorama Pictorial*, reproduced in *Falling Leaf Magazine*, IX, No. 2 (June 1968), p. 53. Reprinted with the permission of the Chinese Information Service, copyright holder.

18 feet, can rise as high as 40,000 feet and fly to reach as far as Tibet and Sinkiang.

More than 213,000,000 pamphlets were flown to Mainland China by these balloons. They carried messages aiming not only at inspiring the people with enmity towards the Mao Tse-tung regime but also of bringing good tidings from the Republic of China. The recent shooting down of the two Communist MIG-19 jets was among the news spread by these balloons.

Apart from pamphlets, the balloons also dropped food, toys, household goods, daily commodities and national flags. Another item included in the delivery is a 'passport' which permits would-be defectors to come safely to Taiwan. Many former Communist airmen, journalists and Red Guards have already landed in Taiwan with these passports.

QUEMOY: POP GOES THE PROPAGANDA*

BY LEE LESCAZE

Propaganda exchanges are often an alternative to hostilities and provide a means of saving faces short of backing down completely.

QUEMOY—Remember Quemoy? Not so long ago, it was widely hailed in the United States and elsewhere as a pivotal frontier of freedom—an outpost as important as West Berlin. When President Eisenhower visited Taiwan in June, 1960, Communist Chinese artillery batteries fired 174,854 rounds at Quemoy in protest. Later that year, presidential candidate Richard M. Nixon's conviction that Quemoy and Matsu had to be defended became a central part of his televised debates with John F. Kennedy.

Quemoy is still being defended by a large but secret number of Nationalist Chinese soldiers plus five U.S. army advisers, and there is still shelling from Chinese guns. But the last explosive shells were those Peking fired in anger over the Eisenhower visit, and President Nixon's trip to Peking [1972] did not spark any artillery protest by Nationalist China.

Now following a well-established and comfortably lived-with pattern, the Communist guns fire only shells containing propaganda leaflets and the Nationalist guns here give counter-battery fire in kind. This shelling is restricted to odd-numbered days and the object is to avoid causing any damage.

"Of course it hurts people if they get hit with a fragment or a bundle of leaflets, which would be bad propaganda, so the Communists try to avoid that and we do the same thing," a Nationalist army officer explains.

*Excerpts from "Quemoy: Pop Goes the Propaganda," *The Washington Post*, March 12, 1972, p. C-5. Reprinted with the permission of *The Washington Post*, ©, copyright holder.

SMALL VICTORIES

Quemoy's propaganda battles are, perhaps unavoidably, a matter of small victories. Although it is not official Taiwan policy, it appears the officers here try to insure that their guns get off a few more leaflet shells than the Communist's each firing day. Last Monday, for example, the Communists lobbed in 46 rounds and the Nationalists quickly returned 50.

The fall-out from the shells provides various sector commanders and their men with grounds-keeping chores. All Communist leaflets are picked up as quickly as possible and soldiers here assume that their counterparts on the mainland are also busy part of every odd-numbered day rounding up the debris.

Leaflets are also exchanged by "air-floating and sea-floating." Balloons of three sizes, with the largest able to carry 178 pounds of leaflets up to 72 hours, are released from Quemoy whenever the wind is favorable which is generally from April to October, a briefing officer says.

The sea-floating operation is more aggressive. Speedboats manned by frogmen maneuver as close as is deemed prudent to the Chinese coast and jettison their cargoes of plastic leaflet containers, bottles and inflatable toys. The narrow strait separating Quemoy from China is undoubtedly the only line of armed confrontation in the world that without vigilant beachcombing would be littered with plastic ducks.

Yet despite the 12 years that have passed since the last high-explosive shell was fired, confrontation is still very real and very armed here.

Although officials refuse to put a number to Quemoy's garrison, well-informed sources say close to 100,000 Nationalist soldiers are on the islands of Quemoy and Matsu north of here.

One of the primary missions for these troops, briefing officers say, is to tie down "hundreds of thousands" of Communist Chinese soldiers who, the officer adds, would otherwise be free to "cause trouble for another part of the Free World."

Quemoy, which is a string of 12 small islands uninhabited by civilians, has gone underground since the late 1950s, when it was a headline story and presidential campaign issue—at least the army defenders have.

They live and stand guard in dozens of strongpoints dug deep into the main island and sometimes tunnelled into mountains.

. . . . Strongpoint 133 is one of the frontline defenses of Quemoy. Its three tiers of firing positions look out over white sand and blue water at Communist-held islands and the Chinese mainland several thousand yards away. Its depth underground is secret, but officers say it is stocked with enough ammunition, food and water to fight without outside support for three to four months.

. . . . At its closest point, Quemoy's main island is 2,310 meters from the nearest Chinese Communist territory. The spot, called Mashan, is the site for one of Quemoy's four loudspeaker installations—another aspect of the psychological warfare program here.

The Mashan loudspeakers are powerful enough to be heard 20,000 meters away, and they shout their message 18 hours a day.

Chinese Communist loudspeakers across the channel shout their message back, but the Nationalist officers say that the Communist speakers are much weaker. They are primarily designed not to reach Quemoy listeners, but to make enough noise on the Communist side to drown out Taiwan's message, officers explain.

A loudspeaker victory was scored during the last Mid-Autumn Festival, one officer says. The festival was a holiday for everyone in Taiwan and the loudspeaker operators made much of this, knowing that Mid-Autumn Festival was not being observed across the water.

"The Communists had to rush out and buy some noon-cakes (the festival's traditional treat) for the people within our range," a loudspeaker officer says happily.

Defectors and fishermen from China provide Taiwan with the best gauge of its psychological warfare program's efficiency. Briefing officers report that these people say they listen to Quemoy's loudspeakers and its radio and are "encouraged to choose freedom."

The last defector to Quemoy was a Chinese Communist soldier who swam to the island last September, officers say. A group of 30 fishermen got caught by bad weather and came ashore last December. They were the most recent visitors from China, and they chose to return after the Nationalists fed them and gave them small presents, in keeping with the government's policy.

PSYCHOLOGICAL OPERATIONS AND AIR POWER: ITS HITS AND MISSES*

BY ROBERT L. GLEASON

Although the Air Force has achieved significant PSYOP successes, the challenge remains to seek out more fully the PSYOP potential of aircraft as a medium of communication.

* * * * *

[VIETNAM]

In reviewing United States military experience in Vietnam, one is impressed with the vastly increased importance that must be attached to the psychological aspects of that conflict. These aspects emerge as both challenges and opportunities. In many cases the challenge has not been fully met, nor have the opportunities been fully exploited.

* * * * *

*This article was adapted from an address given to the graduation classes of the U.S. Army Psychological Operations Unit Officer Course and the Political Warfare Advisor Course, U.S. Army Institute for Military Assistance, Fort Bragg, North Carolina, 25 June 1970. The author wishes to express his appreciation to Dr. Robert F. Futrell for his assistance in obtaining source material and for his critical review. The article was reprinted in *Air University Review*, XXII, No. 3 (March-April 1971), pp. 34-46. Reprinted with the permission of *Air University Review*, March-April 1971, Vol. XXII No. 3.

In 1961, in response to President Kennedy's order to all services to bolster their counterinsurgency capability, the USAF established the 4400th Combat Crew Training Squadron. Known as Jungle Jim, it later became the 1st Air Commando Squadron and finally evolved into the present Special Operations Air Force. Its original mission gave high priority to the conduct of psychological operations. Because of scarcity of experience in psyops, the Jungle Jim personnel turned to the [then] U.S. Army Special Warfare Center for some accelerated instruction in the subject. On 15 November 1961 they deployed to South Vietnam. On 4 December they flew our first psyops mission in C-47s equipped with belly-mounted loudspeakers, following the idea conceived during the Korean War. This mistake cost us about two years in redesign time. The systems proved to be totally unfeasible because of the Doppler effect. Like the train blowing its whistle as it comes down the track, the voice from the air kept changing pitch as the aircraft approached and departed, leaving no more than two or three intelligible words out of a complete sentence. Of course with the speakers protruding down and directly to the rear of the aircraft, circling techniques were out of the question. So back to the drawing board.

In 1964 the Air Force, still searching for its legitimate and complete requirement in the psyops area, contracted with . . . [a private firm] to survey just what was needed. Although the report identified many areas for USAF concentration and application, implementation of these recommendations has been slow and hesitant. For example, establishment of a USAF psyops school was recommended, but only one or possibly two classes were conducted. One reason might be the belief of some in the Air Force that we should merely be concerned with flying aircraft and that someone else will assure that the total psychological impact inherent in the tactical employment of aircraft will be properly calculated. Therefore, if the psychological aspects of air power or air operations are to be maximized, most of the impetus, at least at present, must come from graduates of non-USAF psyops schools. Many of these officers (members of all services) will find themselves on joint staffs where they will have an opportunity to parlay their special talents by applying them to the extensive potential of air power. There is room for questioning whether this has always been adequately done in South Vietnam (SVN).

Besides the early SVN problems already mentioned, many people more recently have expressed disappointment at the failure of the limited bombing of North Vietnam (NVN) to completely disintegrate the morale of the North Vietnamese. Perhaps an indication of what we should have expected can be found by again reviewing the findings of the U.S. Strategic Bombing Survey [USSBS]. In brief, it found that although the demoralizing effect of the bombing of Germany was almost complete, there were certain categories of people who retained an exceptionally high degree of resistance to morale erosion.¹ They can be categorized in three groups: (1) highly disciplined Nazi party members, (2) firm converts

to the philosophy of Nazism whether or not a party member, and (3) those who were convinced in their own minds that their government was doing everything possible to protect them from the bombing raids. Another point made by the Survey was that the psywarfare effect (not necessarily the total military effect) can reach a saturation point under prolonged and incessant bombing. This is brought about by the fact that after a period of time most of the vulnerable and weaker elements of a society flee from the cities and only the strong-willed and dedicated elements remain. This, of course, makes the psywar warrior's job much more difficult, for among other things it reduces the contagious effect of demoralization. A third significant finding of the USSBS was that a government can do much to prepare its citizens psychologically for nonatomic air attacks.²

Applying these lessons to the North Vietnamese campaign is rather provocative. We know, for example, that the North Vietnamese government was given ample time and warning by the slowly escalating nature of the U.S. air attacks, and did, in fact, move great numbers of people into the countryside before intense raids commenced. They also had ample time to prepare those remaining psychologically. Additionally, we expended a considerable amount of rhetoric describing the intense aircraft defense system employed in NVN. Was this not in effect telling the people of North Vietnam just how well their government was trying to protect them? Perhaps instead we should have launched a psychological campaign emphasizing that their defense was unable to halt our penetrations, that no single authorized target was spared, and that their government was not doing all it could to defend its people, for example, "Where was North Vietnam's air force?"

Many other parallels or reciprocals can be drawn between psyops past and present. The purpose of this article is to direct attention to the facts that in new and changing situations military planners must constantly re-evaluate their techniques and that in so doing they should not ignore the lessons of history. If they apply, we should use them. If they do not, we should disregard them. But in either event, we should consciously examine them.

[THE NEW CHALLENGE]

A new challenge facing psychological operations officers concerns the nature of today's conflicts. Before the advent of nuclear weapons, most wars involving major powers were fought to a conclusion: victory for one side, defeat for the other. Deficiencies and omissions that may have occurred in conducting the psychological aspects of those wars were to a great extent obscured by the euphoria surrounding the final and total surrender of the enemy. Today's conflicts are not fought to such black-and-white resolutions. Indeed, in today's wars a military operation may be judged a success or failure not by its tactical accomplishments but by the effectiveness of the psywarfare and military/political actions that

accompany it. Put more bluntly, many victories are victories because one side convinces the other, or neutrals, that this is so.

This situation places psywar in an entirely new context and demands a greater awareness of both the favorable and unfavorable psychological impact of every military action, even, for example, the selection of operational nicknames. Richard H. S. Crossman, the British authority, points out, "The central substance of effective propaganda is hard, correct information . . . and it is necessary to make truth sound believable to the enemy."³ Therefore, while such a name as "Operation Total Victory" (for the U.S. sweep into Cambodia [in 1970]) may have a euphemistic sound when used by friendly troops, it may provide grist for the enemy propaganda mill if the operation does not achieve the goal the nickname portends. This is not the first occasion when the choice of a nickname has been questioned from a psychological warfare viewpoint. In February 1951 the Eighth Army in Korea launched "Operation Killer," a nickname obviously in conflict with the accompanying psywar effort to persuade the Chinese troops to surrender. Similarly, the Fifth Air Force in Korea launched a railroad interdiction campaign as "Operation Strangle," a name that was counterproductive in that those who did not understand the real objective of interdiction were given a vehicle for proclaiming its failure.⁴

Finally, the psyops officer is challenged to conduct his programs and develop his themes in a manner to avoid their neutralization by information emanating from other sources. According to Sir Stewart Campbell, a British psywar expert, "There must be no conflicting arguments not only between outputs from the same sources but also those of different sources."⁵ Every conflict fought since the Crimean War (when the invention of the telegraph first allowed war correspondents to communicate on a daily basis with their home editors) has been subject to criticism from the press as well as the loyal opposition within the government.⁶ In wars where the vital interest of the United States is obvious, such as World Wars I and II, criticism from these sources has been minimal. In conflicts where our vital interest has been more obscured (albeit just as legitimate), the criticism can be expected to be more vocal and persistent. The psyops officer's challenge is to avoid the vitiating effects of this criticism to the extent possible and, above all, to resist the temptation to use the psyops arena to engage the press in any semblance of a military/political psyops argument. Steps in this direction would include limiting psyops actions as much as possible to military objectives and continually soliciting the cooperation of the press in the conduct of these efforts. This latter suggestion lends itself more to psyops activities than to conventional military actions, for the essence of psychological warfare is subtlety and truth, not secrecy or deception.

[CONCLUSION]

If this discourse appears somewhat critical of . . . Air Force participation in psywar operations, it is not intended to detract from the dedication

of aircrews performing these missions. In fact the first USAF crew lost to presumed enemy ground fire in South Vietnam during the early phases of the current conflict was on a psyops mission. This occurred on 11 February 1962.

* * * * *

Despite its initial shortcomings, the air psyops campaign has proved productive. For example, over ninety percent of the Chieu Hoi defectors first learned of that program from air-dispersed leaflets.⁷ More revealing are the reactions of the Communist world to our psyops efforts. One can easily detect a "whistling in the dark" attitude in an article contained in the *World Marxist Review* in which the author says, ". . . moreover [s] cattering leaflets urging the population to turn against their government in areas that were the cradle of the Vietnamese revolution is one of the stupidest blunders the 'psychological war' experts ever made."⁸ One wonders just what part this "blunder" played in causing North Vietnam to issue its infamous decrees "on the punishment of Counterrevolutionary Crimes" a few years later. These decrees list fifteen specific crimes that needed special attention and punishment, including treason, plotting to overthrow the people's democratic power, espionage, defecting to the enemy, undermining the people's solidarity, disseminating counter-revolutionary propaganda, and others.⁹ The necessity of issuing these strongly antipsywar decrees in the "cradle of the Vietnamese revolution" is perhaps our best evidence that our air war and psywar campaigns were having a telling effect against North Vietnam. The vastly increased importance of psychological warfare, especially in a restricted Vietnam-type war environment, is illuminated in the remarks of General Van Tien Dung, chief of staff of the North Vietnamese army, when he repeated an often emphasized theme that it is "the people, not the weapons, who form the backbone of [North Vietnam's] air defense."¹⁰ We should also remember that it is the people, not the weapons, who are targeted through psychological warfare.

CHINA'S USE OF CULTURE FOR PROPAGANDA*

BY JOHN S. BARR

Recognizing that the relative effectiveness of media varies significantly between different population groupings, mainland Chinese leaders employed a variety of media in order to reach and appeal to different population sectors.

When the Chinese Communists set up their regime in Peking in October, 1949, they established a Ministry of Culture and local bureaux of culture throughout the country, emphasizing the importance they gave to culture—partly or largely for propaganda. One very clever aspect of their cultural methods was that their variety enabled them to appeal to different sections of the population, but with a rather special attraction for youth. This article describes the initial methods used in the period 1949-1952.

FOLK DANCING

Folk dancing's natural appeal made it an ideal channel for propaganda. One dance for instance depicted the actions of a girl tending a machine in a cotton factory. This dance was rather beautiful, and many in the audience could understand and appreciate the significance of the simple movements. A similar appreciation was shown of a dance portraying the picking of tea leaves from the teabushes. Young men were also trained to perform some sort of military dance, falling down on the ground and pretending to be digging a trench on one side and then on the other. This militaristic feature went further when a jazz orchestra blared out patriotic song-music for social dancing.

One of the most spectacular examples of mass dancing was in the celebration of the National Day, October 1st, in 1952. The winter and spring of that year had seen the Five Anti Movement sweep all over the country, so that by the end of the summer, gloom and dismay were widespread. Deliberately, therefore, the keynote for the celebration was happiness, and for that purpose all the people were to be taught a simple dance. "all" meant all. The dance was extremely simple. The movements of the dance were taught—in the days preceding October 1st—to grandmothers and children, to housewives and to peasant women, to factory workers and to office staffs.

*Excerpts from "China's Use of Culture for Propaganda," *Eastern World* XXI, No. 11/12 (Nov./Dec. 1967), pp. 10-11. Reprinted with the permission of Foreign Correspondents, Ltd., copyright holder.

The songs that were taught were simple, tuneful and patriotic, and they were broadcast incessantly. For the celebration of October 1st in 1951, all the people were taught three short songs. Each factory would have its little band or orchestra, and the musicians would be dressed in colourful costumes. Red, in Chinese symbolism, stands for happiness. Not a trick was missed in the presentation of these new songs. Most meetings were opened with a practice of the current popular songs. Large numbers of people would sing in unison, and as in Western evangelistic campaigns or at football matches, the participation by a crowd of tens of thousands aroused emotions. A new National Anthem was taught, which had a rousing tune too; Arise was its opening word.

At first, all the emphasis was on training the masses to sing. The National Conservatoire was ordered to make this their first aim rather than concentrate on a few artistes.

THEATRE

Chinese love going to the theatre, and not a few are born actors; whether they understand all the words or actions is sometimes irrelevant. Shaoshing opera and Peking opera have been famous for many years and have always attracted large crowds. The Chinese Communists cleverly encouraged the continuance of the presentation of the old plays but—of course—favoured those in which the villain was a landlord or someone of that ilk. Many new plays were put on. Chinese people have a great sense of tragedy, so they would appreciate a tragedy showing sufferings inflicted by cruel landlords or Japanese militarists. As melodrama is also applauded, plays with an “American imperialist” as the villain were also very popular.

China is a vast country, and Westerners find it hard to believe that plays found in Peking or in Shanghai are also to be found in the countryside. But, the Communist regime saw to it that small troupes of actors would tour the rural areas and that scripts of new plays would be broadcast to outlying parts of the country.

CINEMA

Once again, a Westerner was at a loss in this field too. In the West, the cinema is an entertainment. A movie star will assert that his aim is to make people “happy”—that is to help them to forget their troubles. In China, the Communist aim was and is to use movies for propaganda almost exclusively, and rather cleverly. For example, during the Five Anti Movement, documentaries were made. When Shanghai people saw on the screen the misdeeds of a well-known drug factory, they were greatly impressed. A picture would be shown of a “wicked capitalist factory owner” who painted over rusty old chains that subsequently broke when in use in the fighting in Korea.

During the first two or three years after 1949, the best acting, musical and circus troupes were sent abroad, e.g., to Moscow and to Paris. When

the Chinese in the cities of China saw on the screen a documentary of their troupe being given vociferous applause in Russia and in France, their patriotic pride was naturally aroused with widespread effect. Popular documentaries dealing with current themes were shown simultaneously in 15 or more theatres. Group tickets issued through the schools and factories were extremely cheap, so that the percentage of the population who saw such films was high. Virtually all new films had patriotic themes as "The New-Man Village," "The Dove of Peace," "Stand Up, Sisters."

MINORITIES CULTURAL TROUPES

Cultural troupes included those of the Chinese Minorities as well as troupes invited from foreign Communist countries, such as North Korea or Eastern European States like Poland. In the years preceding the Communist regime the previous Chinese governments had paid little attention to the minorities—of whom the Communists listed more than forty—but the Communists straight away spent considerable money, time and effort on bringing minorities dancing and singing groups from the outlying areas of the country to tour all over China. This had the immediate effect of increasing the patriotic fervour, making the people appreciate the greatness of their nation in many new areas. Chinese appreciate colour, and the costumes of these troupes were decidedly colourful.

The visits of foreign troupes, in the early 1950s, was an adroit move. Peking had not been invited to join the UN; the U.S. had put on embargos; foreign tourists and connections were not too common. Hence, the appearance of these foreign artistes showed the Chinese masses that they did have friends in some foreign countries. This was complemented by the showing of films of Chinese troupes performing in these same countries. Chinese have been famous for their skill in acrobatics for a long time. With their ability in organisation, the Communists were able to procure outstanding performers from all over the country in acrobatics, in conjuring, in Chinese sword dancing. The result was that the performance was of such outstanding merit that it brought tremendous credit and fame to new China. In one circus troupe, one of the acts was performed by an old man and his two sons. The old man was about five feet three inches in height, and was quite slender. The climax of that act was when the old man sat on the floor, and drawing a small hoop—with a diameter of possibly eighteen inches—over his feet and legs, proceeded to squeeze his whole body through this hoop. A popular story had it that when this circus had performed in Moscow, the Russians had asked that this old man be X-rayed.

EXHIBITIONS

The Chinese used exhibitions in a big way, similar to their use of the cinema and radio for propaganda. For instance, the Land Reform Exhibition showed in clear, direct manner the way in which the peasants had

formerly been exploited by the landlords. Pictures, charts and implements all told an easily-understood situation. One could hear the onlookers comment, "Oh, yes, I knew this. I saw that." Skill in the technique of getting across a political message was also shown when there was an Agriculture and Forestry Exhibition. Special charts and pictures were supplied to illustrate how the urban folk could help those in the rural areas, and vice versa.

RADIO

Perhaps it is in the use of radio that the Communists have reached heights—or depths?—that would seem unbelievable to Westerners. Take the celebration of Labour Day, May 1st, in 1951, as one example. A two-day programme was put on, lasting four hours, from 6:30 p.m. to 10:30. Twenty-two items were listed for the first day, including speeches, shouting of slogans, band music, solos, etc. All factories and schools were expected to use their loudspeaker system for listening-in. The programme was designed to whip up enthusiasm for increased production, so that, say after one hour, one factory would telephone in and say, "We have been stimulated to pledge to increase production by ten percent." This, naturally, was immediately reported over the radio. Soon after, another factory would respond and go further by pledging to increase its production by fifteen percent.

In October, 1952, there was a Peace Conference in Peking and after that conference, Shanghai delegates reported it over the radio. Town women sat outside their houses on benches and seats to listen to these reports, and this was repeated all over the country. During one of the early thought-reform campaigns, the children of a prominent "reactionary" were even brought to the broadcasting studio to broadcast an appeal to their father to repent and reform. Another development was the seven o'clock morning physical exercises broadcast over the radio—exercises which were being performed in most parts of the country.

WALL NEWSPAPERS

After the Communist Government was installed in Peking, all aspects of life came under government control with politics pervading the daily life of China to an extent that would not be believed in Western countries.

One of the cleverest devices was in the use of wall newspapers, which might be on a wall or a blackboard or hoarding. Chinese people admire and love good calligraphy. The trick was to get the best calligraphist in the neighbourhood, whose writing was admired, and his material was supplied to him by a politically-progressive cadre. Usually a cartoon or funny picture was added for good measure to attract the passers-by. Also a special section might be devoted to services for the neighbours such as "lost and found," "to let." Items of particular interest to housewives might be added, such as "the daily menu," "how to weave."

In their first five years of government, the Chinese put out more issues of new stamps than many other countries would put out in ten years. These issues commemorated the birthday of Lenin, or a big Communist meeting in Peking, or tractors, or athletes, or the famous murals in the Tung Huang Caves. Matchbox covers had pictures of new factories or of tractors in the field. Wrappings for sweets would have similar scenes, and so would banknotes. Pocket diaries were produced and at the foot of each page covering one week, there would be a saying from Lenin or Stalin, or Mao Tse-tung, or some other Chinese Communist leader.

The lengths to which an individual in any particular walk of life would go to show his political progressiveness can well be illustrated by the following true story. One night in the spring of 1952, in a Chinese restaurant in Shanghai, a feast was being served at two tables. One of the dishes was a watermelon cooked in the Cantonese style. When the two melons were brought in, one for each table, it was observed that the chef had skillfully ornamented the rims not by a fretwork design but by carving out on one melon four Chinese characters for Resist America, Aid Korea, and on the other melon, Protect the Motherland, Assist the Nation.

The Chinese Communists are masters of the art of propaganda. They assign much time and personnel to political propaganda, and many people are employed full time in the propagation of the Party doctrines. For example, in one single district of Shanghai, 25 Youth League Workers who were subsidised by the government had as their full-time job the task of going to the Party branches or organisations in the factories and schools and lanes in their district to demonstrate the latest dances or songs or plays or to tell about radio programmes and the like.

PLAYS AND PROPAGANDA: THEATRE AS A COMMUNICATION MEDIUM IN SOUTHEAST ASIA*

By JAMES R. BRANDON

An account of the use of theatre to convey political themes in Southeast Asia.

In all countries of Southeast Asia theatre has been more than just entertainment. In addition to providing aesthetic pleasure, emotional release through empathic response, and even a means for accomplishing communal celebration of ritual events, theatre has always functioned as a channel for communication. Traditionally, three major channels were open to southeast Asian ruling elites through which they could disseminate their ideas, beliefs, and value systems: the religious hierarchy,

*Excerpts from "Past and Present," chapter 15 in *Theatre in Southeast Asia*, Harvard University Press, Cambridge, Mass., 1967, pp. 277-301. Copyright 1967 by the president and fellows of Harvard College.

scholars and scribes, and theatrical performances.¹ Of these, theatre has unquestionably been the most important in reaching the largely illiterate populations of the countryside and the cities. Priests, monks, and religious teachers have played their role in propagating religious ideas to large numbers of people but their work has often centered at court or in urban communities. The influence of the scholars and scribes has always been limited to the very small group of elite who could read and write. The use of theatre to educate and instruct an audience is not unique to Southeast Asia. Greek citizens were educated en masse at communally sponsored tragic festivals. Horace said Roman drama should "entertain and instruct." Through Morality and Mystery plays in the Middle Ages, pagans were instructed in Christian doctrine and practicing Christians were sustained in their beliefs. In modern times playwrights from Ibsen to Shaw to Brecht, Miller, and Genet have used the stage as a pulpit. Groups of all kinds, from the Nazis and the Communists to Moral Rearmament, have used theatre as well. What is notable about the theatre in Southeast Asia, as compared with Europe or America, is the degree to which it is involved in the educative process. It is not an exaggeration to say that, had the theatre not existed as a powerful channel for communicating to large groups of people, Southeast Asian civilization would not be what it is today. Through the medium of theatre performances, the complex religious, metaphysical, social, and intellectual values of the ruling elite were disseminated to the most unsophisticated villagers in the most remote areas.

The Khmer kings of Cambodia and the Brahmanic priestly class used theatre performances as a part of the ritual worship of the god-king. . . . The kings of Java, Bali, Sunda, Sumatra, and Malaya encouraged and sponsored recitations and performances of local versions of the same epics.

* * * * *

Drama was the main medium through which Javanese, Sudanese, and Balinese religious and philosophic systems were taught to the people.

* * * * *

On the Malay Peninsula, Islamic teachings penetrated . . . drama . . . deeply. . . .

* * * * *

In Thailand, Burma, Laos, and Cambodia, Buddhist . . . stories have been widely performed for several centuries. . . .

To a certain extent Catholic missionaries utilized the appeal of theatre to gain converts to Christianity in the Philippines. Their aims were similar to those of the Moslem missionaries in Indonesia and Buddhist missionaries on the mainland of Southeast Asia. Their methods were not much different.

In the late nineteenth and early twentieth centuries, when European countries and the United States had colonized most of Southeast Asia, local nationalists sometimes tried to use theatre performances as a means of arousing the people against foreign rule. Troupes performing at court . . . were seldom involved, for their repertories consisted of classic plays and their livelihood depended upon court favor. Most anticolonial, pro-nationalistic plays were staged by troupes in the popular tradition. . . . Colonial authorities watched closely for any hint of opposition in theatre performances so that criticism was usually indirect or phrased as double-entendre language which European officials would have a hard time unraveling. . . . However, theatre was not an important weapon of nationalist leaders in their campaigns of harassment and agitation against colonial rule in pre-World War II days. The small nationalist movements were not prepared to use theatre as a propaganda medium in any major way. It would have been difficult to mount a concerted theatrical effort in the face of stern government controls. And, in any case, the nationalist leaders had little time to think of theatre; often it was all they could do to stay alive and out of prison, to say nothing of staging plays.

The largest concerted effort in modern times to utilize theatre as a propaganda medium in Southeast Asia was that of the Japanese occupation forces during World War II. Between 1940 and 1945 the Japanese gained control of every government in Southeast Asia. Through both civil and military channels, Japanese authorities pressed theatre into service to help explain the aims of their Greater East Asia Co-Prospcrity Sphere. Western countries were vilified through the drama, and Asian nations glorified. The Japanese clearly recognized the communication potential of the theatre and assigned considerable sums of money and numbers of personnel to the task.

Few governments in Southeast Asia today attempt to use theatre as a medium of communication in Southeast Asia. In the Philippines, in Malaysia, Thailand, Laos, and Cambodia, governments rarely educate, inform, or indoctrinate people through dramatic performances. Only in Indonesia and in Vietnam is government propaganda regularly disseminated via the stage.² Civil ministries and the armed forces in both these countries organize and operate propaganda theatre troupes, and their efforts to harness the communication potential of theatre for national purposes are extremely interesting.

The largest theatre-as-propaganda program within the Indonesian government is administered by the Ministry of Information through its network of offices beginning on the national and provincial level, extending through regional, district, and city levels, and reaching down as far as the sub-district and the village. Most of the government's theatre efforts

are concentrated on the island of Java, where theatre traditions are strong and where more than half the population of the country lives. In its theatre program the Ministry has adopted an indirect and a direct approach. In its indirect approach the Ministry works through existing professional troupes. . . . Low-level Ministry of Information officials pass along propaganda material to professional troupes, hoping they will put the material in their plays. Materials usually are prepared at the provincial level by officials of the People's Information Section. They may be merely statements of government policy or they may be play scripts and scenarios which incorporate the desired propaganda themes. Up through the 1950's a good deal of effort went into the indirect approach. Many troupes were regularly contacted by information officials. . . . Efforts to work through professional troops have fallen off in recent years.

The Ministry's direct approach is to set up and run its own propaganda theatre troupes. Professional performers are hired as officials of the Ministry of Information. Their full-time job is to write, direct, or perform propaganda plays. The Ministry of Information got into the theatre business during the years of the Revolution (1945-1949), when Indonesia's struggling nationalist government sought ways of rallying the people's support. Conventional mass media—radio, motion pictures, the press—were in the hands of the Dutch. Nothing was more natural than to turn to . . . shadow drama, the traditional mode of cultural expression of the Javanese, as a means of telling the people about government policy. . . . Puppets were flat leather cutouts. . . . But they represented contemporary figures—Soekarno, Nehru, soldiers, Dutchmen, peasants—and they were cut and painted in realistic fashion. The puppets told stories of “national leaders and guerrilla soldiers in their struggle to obtain independence for their country.”³ . . . The Dutch controlled the cities, but it was easy for student-guerrillas to tote a dozen leather puppets, a small screen, and a lamp along backcountry trails. In villages along the route of their march the soldiers performed rousing stories of the fight against the Dutch. Plays were short, for the guerrillas often had little time; they were simple, so unsophisticated peasants could understand them. It is difficult to estimate how many troupes were operating during the Revolution. The Dutch thought . . . [these plays] effective enough to take the trouble, during the Second Military Action of 1948, to search for, confiscate, and destroy several hundred . . . puppets. When the Revolution ended in 1949 the main reason for [the plays] . . . ended as well. People began to see and to care that the puppets were crude and the stories blatant, and no audience would pay to have . . . [these plays] performed. [They were] kept alive only through performances sponsored and paid for by the Ministry of Information.

As the deficiencies of *wayang suluh* became more apparent, a new form of . . . [drama] was created which, it was hoped, would retain the mystic appeal and artistic excellence of traditional . . . [shadow play] while conveying a modern social and political message. This remarkable crea-

tion was called *wayang Pantja Sila*. It was conceived by Mr. Harsono Hadisoeseno, puppeteer and leader of a government information unit. . . . According to Javanese mystic thought there are 144 human passions and characteristics. Puppet figures visually represent all these traits in traditional . . . [theatre]. It was not difficult, therefore, to select appropriate puppet figures to symbolize all the modern concepts of *wayang Pantja Sila*. Just as the puppets of . . . five . . . brothers [in a traditional epic] symbolized the five principles of the Pantja Sila, other traditionally "good" puppet figures symbolized Miss Freedom, Health Services, Education, Agriculture, and so on, while traditional demon puppet figures symbolized evils such as Plant Disease, Devaluation, Inflation, and Loss of Moral Standards, as well as the competing ideologies of Feudalism, Marxism, Individualism, Intellectualism, and others.

Wayang Pantja Sila was created by the Ministry of Information for its own performers, but it was hoped that audiences would take to the new form and that professional *dalang* would begin to perform it. This did not happen. Like . . . [its predecessor] and a dozen . . . [drama] forms created by Javanese princes in past centuries to glorify themselves, *wayang Pantja Sila* never caught on with the public. Likely its elaborate symbolism was too complex for villagers to understand (though in theory its symbolism was the strongest point in its favor). Perhaps professional . . . [puppeteers] shied away from it because it was so closely tied to government sponsorship. Government support for *wayang Pantja Sila* has declined drastically in recent years. Its mild, democratically inclined message is out of date.

* * * * *

Concurrent with its efforts to develop . . . [these theatre forms] as communication media, the Ministry of Information has hired troupes of various standard genres to tell the government's story. . . . [Paper-scroll play] was experimented with, largely because it was simple and inexpensive to perform. A puppeteer to tell the story, some pictures painted on paper, and perhaps an assistant or two were all that was needed. Troupes of . . . comedians were sent touring though Central and East Java. *Dagelan* are the clown roles in *Ludruk* and *Ketoprak*; a dagelan troupe is made up of four or five performers, all of whom play comic roles. These troupes proved extremely successful with village audiences.

* * * * *

In addition to the Ministry of Information in Indonesia, the armed services also operate a few theatre troupes. The army especially is in a powerful position within the government. Its budget is by far the largest of any branch of the government. . . . Each major command of the army has a Morale Unit (URRIL) whose assignment is to entertain troops in the command. Soldiers assigned to a URRIL unit are performers of one kind or another, and each unit maintains several more or less separate

groups of performers. . . . URRIL officers say they usually choose "patriotic or fight" plays . . . as appropriate for their military audience. The primary function of military theatre troupes is to entertain. Their secondary function is to inform. . . . Similar morale units are found in all the armed services. Army, navy, and air force headquarters in Djakarta also sometimes send out professional troupes for one- to two-month tours of military posts on the outer islands.

ORGANIZATION AND OPERATION OF US-SUPPORTED CULTURE-DRAMA TEAMS*

BY THE JUSPAO PLANNING OFFICE

By establishing closer identification with the local population and clothing messages and appeals in traditional culture form, culture drama teams provide a congenial setting for the presentation of political communication. Under these conditions, the target population is more likely to be attentive to the messages and appeals.

INTRODUCTION

Culture-drama entertainment in rural hamlets is a traditional expression of culture in Vietnam. Roaming culture-drama teams began to operate in the days of Chinese domination and this tradition has continued through modern times. Because of the widespread familiarity of the peasant with the culture-drama and his wide acceptance of this traditional culture form, the Communists seized upon the concept and developed it into a PSYOP weapon. The Communist forces in Vietnam presently use culture-drama to bolster the morale of both combatants and non-combatants, to instill attitudes favorable to their cause, and to sustain *their attack on the political, military, social, and economic objectives* of the Government of Vietnam.

During recent years the Government of Vietnam, with support from United States organizations, has employed culture-drama teams to assist in accomplishment of its objectives. These teams have had varying de-

*Excerpts from "Organization and Operation of U.S.-Supported Culture-Drama Teams," JUSPAO Field Memorandum Number 57 (Saigon: JUSPAO Planning Office, August 21, 1968), pp. 1-8.

gresses of success. The most successful program to date has been the U.S.-supported Van Tac Vu program, which over the past two years has operated from 13 to 20 teams, of from six to eight members each, in remote hamlets of South Vietnam.

Early in 1968 Van Tac Vu teams were increased from 13 to 20 and the plan was to effect an increase up to 26 by December 1968. This plan was rendered impracticable by national mobilization. Military conscription of Van Tac Vu personnel reduced the program from 20 field teams in March to 11 in May 1968; and by 1 August 1968 the number had been reduced to five.

In order to keep the culture-drama program operating at an effective level, it becomes necessary to identify or organize teams in the provinces, consisting of personnel assigned to ARVN military organizations, Revolutionary Development cadre, CIDG or Armed Propaganda Teams, and other personnel who are draft exempt or have draft deferment status.

A culture-drama team is a group of young and talented artists, organized to conduct PSYOP programs through the medium of entertainment. Each team should be composed of from five to nine members. Experience has revealed that a good balance is achieved by the formula of two-thirds male members, one third female. These teams tour the hamlets of remote and contested rural areas, entertaining the people and using entertainment as a medium for PSYOP messages in support of programs and objectives of the Government of Vietnam. Such programs and objectives include, but are not necessarily limited to, those of National Reconciliation and Chieu Hoi, Revolutionary Development, the GVN Image, the Refugee and Police Programs, Phoenix, RF/PF and other pacification efforts. The teams perform not only in village/hamlets, but also in refugee and Chieu Hoi Centers and at RF/PF outposts. When necessary and feasible they operate in direct support of military operations.

GOALS OF CULTURE-DRAMA TEAMS

1. To revive the native culture-drama tradition and forge it into a tool of combat; in other words, to create a National Combat Culture-Drama.
2. To counter alien culture-drama forces adopted by the Communists.
3. To provide a medium whereby, through entertainment, PSYOP support may be provided to programs and objectives of the Government of Vietnam.

RESPONSIBILITIES

* * * * *

United States organizations—military or civilian—which conduct psychological operations are encouraged to organize and/or support culture-drama teams at the province level, each to operate within a province. Such U.S.-supported teams should operate under the control of a local agency of the Government of Vietnam but may be supported

entirely or in part, according to need, by U.S. organizations. In no case should a culture-drama team use the title of a U.S. supporting agency in its publicity or during performances. Continuation of support must, of course, be determined on the basis of the effectiveness of the teams, as determined by the supporting organization.

THE PROGRAM OF THE CULTURE/DRAMA TEAMS

Culture-Drama Performances

The basic mission of a culture-drama team is to perform for populations of village complexes. Such teams normally perform once or twice a day. If the security situation permits, they conduct night performances.

The typical performance lasts for an hour or more and includes modern and traditional VN songs, a magic show, skits, plays and humorous tales. Dances may be performed if the requisite talent exists. Virtually all of the material is PSYOP-oriented, i.e., it serves the objectives of GVN programs.

Cultural Seed Planting

This activity is directed toward school children and other youngsters of elementary and early secondary school age. In Cultural Seed Planting sessions, children learn patriotic songs and develop pride in being citizens of Vietnam. Woven into the singing sessions are lessons designed to encourage children to respect their teachers, to obey their parents, to get along with their friends, to love their native country, and to identify themselves clearly with the elected Government of the Republic of Vietnam. Parallels are drawn between the present defense against aggression and struggles in past centuries against other invaders.

Cultural Seed Planting is conducted at schools, in parks, in orphanages and at any other location where children may be assembled. This is a regular, daily task for the teams. A normal session lasts from one to two hours.

PSYOP Civic Action Activities

In addition to the PSYOP content of their performances, culture-drama teams, by the nature of their operations, have an unusual opportunity to disseminate information and publications at the "rice-roots" level. This also is a daily major assignment.

Before leaving the provincial capital on an operation, the team should contact organizations conducting PSYOP in the province and pick up leaflets, posters, magazines, and other materials supporting current PSYOP programs for distribution in rural areas.

Culture-drama team members may conduct Chieu Hoi broadcasts at night, when the situation warrants, over ground public address systems. They attempt to communicate with the Viet Cong and with VC-connected families to explain the Chieu Hoi program and in this way to persuade members of the Viet Cong to return to the Government of Vietnam.

In order to create a strong identification between the people and the team, the team cadre engage in manual labor on small projects designed to help the people of the hamlet. They clear and dig drainage ditches, repair fences, sweep out marketplaces, help improve roads, wash babies, and tend to sick and wounded soldiers. In short, they perform any helpful task that is within their capabilities. Such activities are conducted daily—they are symbols of the bond that joins the culture-drama team members to the people. This spiritual aspect of their work is more important than the practical significance of the tasks performed, although each task must have practical benefit if the teams are to communicate with the villagers.

Popularization of Culture-Drama

A culture-drama team may organize local artists into hamlet and village culture-drama teams. Through this means, songs and dramas are woven into the daily lives of the rural population. Further, the formation of village/hamlet culture-drama teams opens up new possibilities for information and PSYOP activities. Culture-drama team cadre are able to concentrate on Cultural Seed Planting over longer periods of time and thereby to promote a more deeply-rooted sense of patriotism among young people.

To accomplish this task a team must live in a hamlet over an extended period of time. The goal was successfully reached by Van Tac Vu Teams at three experimental locations. However, this success engendered particularly strong and violent reactions from the Viet Cong and the program had to be suspended temporarily under 1968 post-TET security conditions.

This activity should be resumed as soon as practicable, since popularization of culture-drama can assist in accomplishing the pacification objectives of the GVN. The basis of this concept is: The strength of any given program is limited, but the ultimate strength of the people is boundless. Culture-drama aims to tap the strength of the people. At the same time it seeks to guide and motivate the people to identify themselves with the Government of Vietnam.

FINANCIAL SUPPORT OF OR ASSISTANCE TO TEAMS

Financial assistance to or support of culture-drama teams must be based clearly and directly on their effectiveness in psychological operations in support of GVN objectives. There is no justification for using U.S. funds for support of mere entertainment troupes.

U.S. organizations supporting culture-drama teams in whole or in part must provide adequate funds for such support. The cost of maintaining one team of eight members for one year is, at present wage levels, approximately one million piasters, not including any initial cost of equipment.

... All pay systems should be as uniform as circumstances permit.

There should be no competing for talent by one organization offering higher pay than another.

In any case, it is essential that the pay scale adopted by any organization incorporate some kind of incentive pay, modeled after that applying to Van Tac Vu Teams. The incentive pay system has been a vital element in the success of the Van Tac Vu program.

Provincial-level teams may be composite in nature, i.e., composed of personnel drawing salaries from different organizations. In such cases, personnel whose basic salaries are lower than the standard for culture-drama team members should be brought up to the team level by augmentation of their pay, and all personnel on a team must have equal opportunity to earn incentive pay.

BASIC PRINCIPLES AND POLICIES

Experience has revealed certain principles of organization and operation which are fundamental to the success of a culture-drama program. U.S. organizations should support only those programs which meet, or show definite promises of meeting, these basic principles.

It is essential that culture-drama teams live among village/hamlet populations. . . .

Culture-drama work must be fulltime employment, not an afterhours' activity [of] students. . . .

Appearances of culture-drama teams at social functions of GVN or U.S. organizations should be limited to those necessary for public relations purposes, i.e., to gain support. . . .

Team members must be dedicated, patriotic citizens of the Republic of Vietnam. . . .

Team members must be of high moral character. . . .

Team members should have the ability, or the potential to develop the ability, to establish strong identification with the rural population, to win their favor, and to establish a channel of communication from the Government of Vietnam to these rural audiences.

Teams must earn their pay. . . .

It is not sound to assume that musical or acting ability is the sole requirement for becoming a member of a culture-drama team. . . .

Membership on a culture-drama team must not be permitted to serve the financial interests of the team members or the sponsors.

The basic requirements for employment on a team must be talent and proper attitudes. . . .

It is essential that team members, while operating in the field, function as a family. . . .

Programming, within the general themes and objectives outlined by a supporting organization, should be left largely up to the team members.

OPERATIONAL CONSIDERATIONS

Experience has revealed that a culture-drama team should operate within a defined monthly cycle. The cycle established for Van Tac Vu teams is cited here as an example only. These teams generally depart from their headquarters, usually the province capital, for field operations on the fifth day of each month. They spend 20 days in intensive operations in the hamlets. On the 25th day of the month they report back to their headquarters and file their report on operations and the team's diary with the sponsor. Payment of salaries is made at this time, since the amount of incentive pay due cannot be determined until the report is filed. The team leader is reimbursed at this time for costs of transportation and other allowable team operational costs.

After the 25th of the month the team members are allowed five days for recuperation. The first five days of the subsequent month are spent in rehearsal of songs, skits, plays and other program material for use in the upcoming monthly program.

Material used by culture-drama teams must be unsophisticated, i.e., it must be aimed at rural audiences rather than at urban people. The music selected for presentation must be inherently Vietnamese, classic and modern. In the past, some teams have consistently appealed to the tastes of urban audiences influenced by Western culture. This kind of music, particularly including the modern popular music imported from the United States and featured in city night clubs, does not serve the purposes of the culture-drama program.

Operational schedules should be drawn up well in advance of each operational month, in consultation between the supporting organization and the team leader. This schedule should list the hamlets, refugee centers, outposts and other locations to be included in the itinerary. Program content also should be planned in advance, including "themes of the month." In developing monthly plans, it may be helpful to consider the content of the *Van Tac Vu Magazine*, which is a primary source of program material.

The sponsors must provide the maximum attainable security for the team, since it will be a target for the Viet Cong.

Experience has revealed that it is a bad practice to lend money to or provide advance payments to team members. This practice has invariably had an adverse effect on cadre discipline and morale.

NORTH VIETNAMESE AND NFLSV SONGS AS PROPAGANDA*

By the 7TH PSYOP GROUP

Songs are an important medium of communication in many cultures. Singing often accompanies work routine and thus can become a significant medium not only for communicating messages, but also for reinforcing ideas.

*Excerpts from "Communist Propaganda Trends," Issue no. 608, pp. 11-15.

Two song books were issued in 1966 in Hanoi—one is devoted to songs used by the National Front for the Liberation of South Vietnam (NFLSV) and the other book contains songs sung in North Vietnam itself.

LIBERATING THE SOUTH

The first songbook is called "Liberating the South." On a green cover the words "Vietnamese Songs" are written in Spanish, French, English, Chinese, and Russian. The majority of the songs used to "liberate the south" are understandably marches.

The first song in this book is dedicated to the NFLSV and called "Liberating the South." It is described as the official song of the "South Vietnam Liberation National Front". The sentiment in this song is perhaps exemplified by a few quotes from the English words that North Vietnam has supplied for its English-language songsters. Among the words of the lyrics are such stout-hearted appeals as "together we advance resolutely. . . to annihilate U.S. imperialism . . . for so many years, our rivers and mountains have been divided." The writer of the lyrics takes pride in the geography of Vietnam and refers to the "majestic Mekong River" and the "glorious Truong Son range."

The song concludes with a refrain which calls upon the "heroic southern people" to rise up because "the sun is rising everywhere and we pledge ourselves to build our country and make it bright and lively forever." As will be noted, this song contains such propaganda themes as anti-imperialism, a call for the unification of Vietnam, and pride in majesty of the nation. This song is a call to people in South Vietnam and makes no reference in the English lyrics to Communism or North Vietnam.

The next song in the book, not a march, is entitled "Uncle Ho's Voice".* The lyrics tell us of the tender voice from "beloved North Vietnam" that reaches South Vietnam, "our native land." Uncle Ho's voice is described as filled with love and bright as the morning sun. As the bringer of tremendous hope, Uncle Ho speaks with a dear voice, the voice of a tender mother. Quite understandably to certain groups of Vietnamese, perhaps, this voice penetrates deeply. Any singer of this song informs Uncle Ho that the South Vietnamese people are rising up against the wicked enemy and they are marching forward under the "national liberation flag" and that millions of people believe in "Him." Uncle Ho, presumably an atheist, might be surprised to know that Hanoi translators in the English lyrics thought it proper to use the capital letter denoting a Deity for the pronoun "Him" in referring to Uncle Ho.

The next two songs are called "The March of Liberation" and simply "The March." These are what [the NFLSV] probably mean by people's songs, full of such popular gusto as "hatred makes us strong," "we go to kill the last of the Yankee imperialists," "we sing songs of optimism,

*"Uncle Ho" refers to Ho Chi Minh, North Vietnamese leader.

although our people are suffering too much," but nevertheless "hatred is burning in our hearts."

A song called "The Hour of Action" is apparently a battle chant. The lyrics say that the NFLSV cannot soften its hatred, that its soldiers must live and that the enemy must die, and that the "new wind from the five continents is supporting us in our just struggle." It soars in fervor to say, "the revolutionary tide is surging, Rise up!"

"Spring at the Resistance Base" is a pastoral ballad of the guerrilla soldier who contemplates the songs of the birds, the bursting forth of the flowers, and the wind in the forest trees. He admits that he is homesick, but more important, he remains resolute in his determination to wipe out the enemy.

A song called "The Bamboo Spike" is a eulogy on the efficacy of bamboo spikes that draw the enemy's blood. This song is apparently designed for a chorale. There is a solo part, a part for all, a part for the men, and a final section that is described for "two bands." The song seemingly requires one of the chorus to hold up a spike, for it says that "this spike is no doubt a bamboo spike . . . it is the spike which yesterday killed the enemy who came and ransacked our village." One solo part goes, "Brothers! Let's plant the long spike in the deep trap." The chorus cuts in, "Long spike, short spike, everywhere spike, spike bristling upwards or planted in the deep trap." The finale reasserts the theme: "This is the spike to kill the enemy and protect our village, Oh! bamboo spike!"

The girl heroine seems to be popular in Vietnamese song and story, and the NFLSV would not be without a heroine. A tune called "The Everlasting Song" is, according to its lyrics, the song of a girl from Quang Nam, a heroic South Vietnamese girl. The words go on to say, "Miss Van! Your song will last forever . . . your heroism will be admired by generations to come . . . the whole South Vietnam is aroused with indignation and sings your everlasting song." The final line gives the heroine's name: "Tran-Thi-Van, your name will live forever."

"Jacket Making Song" is a panegyric to the dedication of the home front. The singer declares that whether it is bitter cold or sweltering heat, those at home will continue to make "jackets" so that their fighters will be resolute and kill the enemy. A third refrain goes: "Speed up your work, oh brothers and sisters." The jackets are said to clothe "the liberation fighters" and the home front wants to express hatred "in silk."

The last song of the NFLSV book is called "Longing for the Liberation Soldier." This is a hymn to the greatness of one NFLSV fighter. It contains such lines as "I love the liberation soldier and miss him when he fleaves . . . a liberation soldier is soon going to annihilate the U.S. imperialist . . . all our people march to annihilate the enemy . . . and make spike traps to defend our villages . . . for the day of reunification of all the people, north and south . . . and all our people will live under the same roof."

The foregoing song collection has been brought out, it is presumed, because the songs are the favorites of the NFLSV.

READY TO STRUGGLE

The second book is devoted to songs sung in the North. It follows the same format, having on the cover the words "Vietnamese Songs" written in Chinese, Russian, French, English, Spanish, and of course, Vietnamese. The title of the book is *Ready to Struggle*, and on the blue cover is a drawing of a U.S. aircraft seen in a gunsight with its wing shot off and falling towards the earth, apparently an exemplification of the dedicated antiaircraft skill of the North Vietnamese antiaircraft unit.

The first song in the book is called "Ready to Struggle." It tells us to music that the people in the north are holding sickles, hammers, or pens in their hands, and they are vying with each other to boost production either in the fields or at construction sites. Like the NFLSV, their hearts are "filled with hatred" and all are anxious to deal deadly blows to the U.S. aggressors. The lyrics call for the transformation of pens into guns since only through struggle can the people grow up quickly. According to the song, the people in the north want to sacrifice their lives for the fatherland; they are unafraid of hardships and difficulties. The singer calls to North Vietnamese youths: "Let's rise up and defend our bright sky."

The second song is pep chant to antiaircraft and other weapons. It is called "Strike Them Accurately." Characteristic of this song is "Our sea is not their pond . . . don't let them soil our air . . . shoot them down . . . annihilate them . . . let us smash their aggressive scheme."

The first two songs are marches, as is the third, in which North Vietnam in song tells the south, "O South, We are Ready." The lyrics point out that "the south is calling upon us, and at this call from you (the south) immediately will start to resist the enemy." The refrain goes: "Just a call from you and we will start to reach our native south."

In a more bellicose vein, is the next aria, "Ready! Fire!" The singer tells how Vietnamese antiaircraft units are smashing "U.S. piratical planes", and how the whole north is "red with flags and soaked in sweat." The singer ends by declaring that the battery in the north is always ready to aim and fire at U.S. imperialists.

Among the North Vietnamese songs is one entitled "Cling to the Sea of Our Homeland." It is devoted not only to the defense of the sea but to the triumphs of the fishing industry. The lyrics begin by describing northern boats going out to sea and when they come back, "our boats will be full of fish." The boats will go "everywhere, pursuing the streams of fish to find things to make our life more joyful." The lyric writer declares that the enemy tries to send over "a lot of spies," but bearing deep in our heart our hatred, "we will force them to pay." In other words, no matter what happens, the message continues "defend our fatherland."

"Quang Binh, O My Homeland" extols an aria. The lyrics laud the good rice plants there, a militia girl who acts as a sentry on the coast, and the songs of fishermen of the cooperatives "who share the sky and the sea and have a rich income." Here also toil young women drying salt along the shore and woodworkers busy in the forests. The English version used the

word "hallelujah" after various lines, but the hallelujah seems to follow no real pattern and is an odd choice for atheistic Communists. The song goes on to tell how mothers and sisters have sacrificed and saved rice to feed the troops. Although Quang Binh is the homeland of the narrator who will defend it because he loves it, he wants to send to the south his true feelings since someday "all will meet again in one home, the day of great victory."

North Vietnam has made a national hero of Nguyen Van Troi, who attempted to assassinate U.S. Defense Secretary McNamara, was caught, and executed in Saigon. A stamp has been issued in North Vietnam honoring Nguyen Van Troi and also a song entitled "Your Words Will Echo Forever." The lyrics say that Nguyen Van Troi, a worker of Saigon City, faced the enemy guns and is now known all over the world through words that echo "until Venezuela." The song tells us that millions will follow the example of Nguyen Van Troi, who has become as "iron and steel" in the effort to kill the U.S. aggressors. The lyrics predict that Nguyen Van Troi's words "Long Live Vietnam" will echo forever.

"Starlights," a love song, talks about the perfume of the night scent, lamps shining, and millions of stars in the sky. The homes in North Vietnam are described as warm with love, where couples may live in love, and where they have pledged to build more and more houses so that they can live in a homeland where one day there will be more songs of love. The singer thinks of home in the south and one day hopes to return there "when millions of stars will shine again to embroider the dark." The lyrics say, "O my sweetheart, we are separated by two zones and partition tears down our hearts," but one day this will all be over.

The song "On Our Way Forward" is dedicated to construction of many kinds. The jungles will be turned into corn and rice fields; new sites will go up everywhere. In the past the singer has fought the enemy; he has fought by the banks of the Mekong River, but today he is standing on the banks of the Red River in North Vietnam, building a new nation that will be filled with joyful songs.

The last song in the book, "Wherever the Difficulties Are, There the Youth Will Be", is a lyric in praise of young fighters. The words say, "We follow the path of revolution and we forget ourselves . . . we are determined to fight, overcoming hardships, we advance to the future towards the bright society . . . when the Party needs us we are ready . . . wherever the difficulties are, there the youth will be."

COMMENT

Not one of these 20 songs is devoted to peace. There are some nostalgic bits about the homeland, but nowhere [in the books] do any . . . lyrics writers hope for peace except on North Vietnamese terms of total victory. The songs are bulging with Communist ideas of self-reliance; dependence on Party leadership; the glorious joys of construction, whether in town or on farm; and the intrepid qualities of Communist guerrillas.

SYMBOLIC ACTS AS PSYOP*

BY ROBERT T. HOLT AND ROBERT W. VAN DE VELDE

A simple symbolic act (propaganda of the deed) will often carry a message that will have greater impact in influencing people's thinking and behavior than an elaborately planned propaganda campaign.

Meaning, of course, can be "transferred" through various types of action. Indeed, all foreign policy operations have a symbolic impact over and above their physical impact. But we are not imperialist enough to claim, therefore, that all foreign policy acts belong ultimately in the bag of techniques to be used in psychological operations. There are, however, instances when physical operations are important primarily for the meaning they convey rather than for the change in the material world which they bring about. Some of the Commando raids in France and the Low Countries in 1942 and 1943 were of primary importance not because of the physical damage that was done or because of the information gained about German defenses. But they suggested to the German High Command that an invasion was in the offing and thus tied down troops which could have been effectively used on the eastern or Mediterranean fronts. They also perhaps encouraged the captive populations to resist and harass their German masters. The Doolittle raid on Tokyo in 1942 is another example. The impact on meaning throughout the world was far greater in its implications than was the damage done to Tokyo.

There are also a number of peacetime examples of activities whose symbolic impact is of primary significance. The Moslem festival of *Id al Adha* is the time when thousands of Moslems journey to Mecca. In 1952 *Id al Adha* fell on Friday the twenty-ninth of August, but Mecca's gates were to close on the twenty-seventh. Less than a week before the gates closed, there were more than 4,000 pilgrims stranded in Beirut—800 miles from the holy city. All had air tickets but the local airlines simply could not handle a fraction of that number before the deadline. After some amazingly fast and thoughtful work by the American legation in Beirut and by the departments of Defense and State in Washington, the Air Force rushed fourteen C-54's to Lebanon and began to airlift the pilgrims into a city only 40 miles from Mecca. Flying around the clock, they made it possible for all the pilgrims to get into the holy city before the gates closed. The story of the airlift "magic carpet" was told in the Moslem press throughout the world, and the United States received favorable editorial treatment in a press that had been noted for its hostility.¹

Although military aircraft were used, one could hardly argue that this was a military operation. It was an operation that indicated to Moslems in

*Extracts from *Strategic Psychological Operations and American Foreign Policy*, University of Chicago Press, 1960, pp. 31-33. © 1960 by the University of Chicago. Published 1960. Second Impression 1964. Reprinted by permission of the University of Chicago Press, and the courtesy of the author.

Turkey, Egypt, Iran, Lebanon, and Afghanistan that the United States, a foreign policy giant in the world, would keep an eye out for the "little guy" and was willing to help him if he got in a tight spot. It is difficult to conceive how much propaganda, rumor, and personal contact would have been necessary to get this message across in the absence of the airlift. Its impact was primarily symbolic. On the other hand, although the Berlin airlift had tremendously important symbolic effects throughout the world, one cannot say that its primary purpose was psychological. Once the Allied decision to stay in Berlin was made, the airlift became a necessity for circumventing the Soviet blockade.

In these kinds of physical operations it is extremely difficult to draw a clear line between a psychological operation and a military or economic one. But it is important to recognize that some desired changes in the apparent world can most effectively be provoked by a physical operation and that some of these techniques ought to be at the disposal of those responsible for psychological operation.

THE OLDER VIETNAMESE AS A COMMUNICANT*

BY THE JUSPAO PLANNING OFFICE

A person with prestige among members of an audience, or one who speaks with recognized authority, has an advantage in persuasion. Age is one relevant factor to prestige in communication; older persons generally tend to be more influential than younger persons advice, with some exceptions, is often sought from older persons.

Age commands great respect in Vietnam. The aged are honored members of the family, the village, and society in general. Traditionally they are entitled to the best food, the best clothing, the best treatment, and deserve honor on all occasions. In old Vietnam elderly men invariably were the heads of their households. This great respect for the aged continues today to a large degree in the rural areas of South Vietnam. In the cities of the South young people are breaking away from family control. In North Vietnam Young people are being taught to turn against the family and parental authority.

* * * * *

Undoubtedly the most important force for harmony in traditional Vietnamese society—one which remains strong today—was family loyalty.

*Excerpts from "The Older Vietnamese as a Communicant," JUSPAO Field Memorandum No. 27, October 4, 1966.

Upon the kinship system rested the entire society, which fostered and cherished it. The basic social unit was the large household of an older man and wife, their married sons, daughters-in-law, and grandchildren. While today this extended social unit is less common, family ties still reach out as they have for thousands of years in Vietnam even beyond the large family to a far wider group of relatives. Traditionally, the family system was strengthened by the pattern of landholding. Most land was owned in small family parcels—only in the last century did large plantations develop. The Vietnamese farmer-family traditionally raised or made nearly everything it used.

To build upon this foundation of family life, the Confucian philosophers found their mortar in *hieu* [or filial piety]. Taking for their premise that feelings of love and respect for parents were innately ingrained in people, they built an entire system of social relations. A proper son, one who cultivated his natural feelings of respect for his father, would as a consequence be a useful member of the community and a dutiful subject of the king. The most important religious ceremonies in Vietnam are rites for family ancestors in which feelings of filial piety are manifested by veneration of departed ancestors. This is the so-called “ancestor worship” which strongly influences Vietnamese thought patterns. The belief is that each person is a link in the endless chain of humanity. One’s family therefore includes not only those alive to today, but past generations and even the unborn to come. A person’s fate upon death—whether he becomes a good spirit or a demon—depends not only on his behavior during life on earth, but also on the solicitude with which his descendants honor him. The highest achievement of *hieu* is to serve the dead as though they were the living. This attitude has the effect of inculcating a strong sense of timelessness which stresses the importance of those who have gone before, of elderly people, alive and even dead.

There are certain countervailing factors with respect to Vietnamese youth. One is the normal “war between generations” in which neither the old nor the new generations knows quite what to make of the other. Another factor, for Vietnam, is a byproduct of the modernization process in which a society finds that its traditional virtues are breaking down because, particularly to the young, they seem no longer adequate guides to behavior. This manifests itself in such phenomena as the “Saigon cowboy,” brother to the American [hippie]. A more fundamental countervailing factor is the age median in Vietnam. Vietnam is a young nation in terms of age distribution. Half the people are eighteen years of age or under (as compared with the U.S., itself a relatively youthful nation, where half the population is 25 years of age or under.) And finally there is among Vietnamese city youth a widespread and deeply ingrained suspicion, distrust and cynicism for elders, particularly for elderly politicians. Youth here tend to believe that all Vietnamese who have engaged in political activity during the past twenty years or so, have been tainted and compromised and are unworthy of respect or even attention. This

amounts almost to a prejudice since little effort is made to distinguish one individual from another; the condemnation tends to be a blanket one.

The Communists have asserted that the Vietnamese family system is the source of great social injustice in Vietnam and note the Vietnamese proverb: The son of the emperor is crown prince, and the son of a temple guard spends his life sweeping banyan leaves. The Communists argue that the system causes sons of influential persons to get preferred treatment in business or appointment to high position in government, which discriminates against those whose families are not affluent or politically powerful. While there is something to this assertion—just as it has some validity in the United States—on balance it appears that the Communist attack on the concept of *hieu* has not profited them. As one Vietnamese noted: “*Hieu* is like a gulf stream, on the surface a merely peaceful concept like other traditional streams of thought in Vietnam. In reality however it is strong enough even to resist tyranny.” Most Vietnamese were horrified by the Communists’ so-called “denunciation movement” in North Vietnam in 1953-54 in which children were encouraged to denounce their parents to the state.

An elderly traditional-minded Vietnamese is impressed most by [individuals] who combined the traits of dignity, humility, wisdom and self-control. Such[individuals] always are calm and unruffled. They never lose their temper. They never shout. They always have a wise and philosophic word to say about events and people. . . . He will impress a Vietnamese as a man of eminent character and honor. . . . It is not that Vietnamese are not materialistic, for they are. But they still do not have the same attitude toward progress as do Americans. This is not because they are against progress, but because they conceive of it—and indeed the whole universe—in different terms and using different concepts.

* * * * *

To the elderly Vietnamese the best and proper behavior consists in knowing and understanding the world, and having understood it, adjusting intelligently to it. To a large degree this means learning how to accept the blows of a capricious fate with decorum. The wise man does not try to change his universe, he adapts to it. Bend as does the bamboo in the wind, say the Vietnamese. . . . What Vietnamese see as suppleness we see as duplicity, what they see as tranquility of spirit we see as lack of concern. And what we see as resolution, the Vietnamese see as intractability; what we see as boldly meeting challenge, they see as disrupting of the harmony of the universe.

* * * * *

If you treat elderly Vietnamese with genuine consideration for their feelings, if you behave toward them at all times as if they were dignified persons worthy of respect, if you simply practice good manners, you cannot go seriously wrong. But this behavior in the final analysis is a

function of your underlying attitude toward the Vietnamese. Vietnamese are unbelievably sensitive to whether or not a foreigner *likes* them as a group. If you do, they will know it, and make all sorts of allowances for your unintentional errors or even your loss of temper. If you don't like them, you will never be able to hide that fact.

AN UNKNOWN WARRIOR*

BY EDWARD J. CLARKSON

Rallies of returnees engaged in direct contact with families and friends of known guerrillas have unmatched potential for reaching insurgent ranks with propaganda messages and appeals.

Individuals who have served the Viet Cong or the North Vietnamese Army in South Vietnam may join the Government of Vietnam and be welcomed as citizens of the Republic of Vietnam, so states the Chieu Hoi policy of the government of Vietnam.

This policy was adopted by the government early in 1963. Americans, who had gained experience working with and observing defection programs in the Philippines (HUKS) and in Malaya with the British, suggested a similar program and assisted in establishing it.

The rationale is that an enemy force can be weakened by creating opportunities for defection. If the enemy soldier has no alternative to remaining, the enemy force is strengthened. But if an attractive visible alternative exists, the enemy's problems are compounded to a point where almost anyone is suspect. Such a pattern imposes on the enemy a requirement for additional manpower to observe their fellow soldiers.

The Chieu Hoi program aims at projecting the government to the people in a confident and humane light, reversing the process whereby the enemy, having gained a recruit, claims his family's loyalty as well. It provides the family with a means to appeal to him to return home, as the returnee is offered a personal amnesty and a means to return to normal life away from deprivations and hardships of guerrilla existence.

* * * * *

The task of informing and persuading the Viet Cong and their comrades to rally is called the "inducement phase." Inducement is accomplished primarily by the use of airdropped leaflets; by aerial broadcast from low flying planes, and by appealing to units and individuals, by name, if known.

Possibly an even more effective method of inducement [than airdropped leaflets and aerial broadcasts from low flying planes] is direct personal contact. This is accomplished by armed propaganda teams, composed of former Viet Cong who volunteer to go out into insecure territory and VC-terrorized areas to tell the people of the Chieu Hoi program. Gener-

*Excerpts from "An Unknown Warrior," *Marine Corps Gazette*, LIV (August 1970), pp. 38-43. Reprinted by permission of the copyright holder, the Marine Corps Association, publishers of the *Marine Corps Gazette*, professional journal for Marines. Copyright © August 1970, by the Marine Corps Association.

ally a team is composed of five to eight men, all lightly armed for self-protection. They may spend anywhere from a number of hours to a few weeks living and conversing with the population of a particular village. They may conduct rallies and distribute informative literature about the government. They may distribute food commodities in short supply. These men, organized loosely along military lines, provide visible proof to the population that the government backs up the policy of the Chieu Hoi program. At the same time, by just being there they point up the fallacy of VC propaganda, which states defectors are tortured, imprisoned and generally, shot.

Each province and the city of Danang in I Corps has an armed propaganda company composed of Hoi Chanh (returnees) who are trained and equipped to conduct face-to-face propaganda operations. These teams have proved their value by assisting in the control, interrogation and propagandizing of the local populace; by applying their knowledge of VC tactics to locate mines, booby traps and caches; by gathering intelligence from the populace with whom they come in contact; and by spotting VC suspects.

* * * * *

UNORTHODOX TECHNIQUES

Some of the unusual means of communicating messages and appeals include the use of deception, poison pens, mournful sounds over loudspeakers during the night, gossip, superstitions, and rumors. The first two essays recount incidents in which deception was used effectively, and discuss conditions for its use. In "Our Poison Pen War Against the Nazis," a gimmick for unwittingly exposing a target group to PSYOP messages and appeals is described. "Psychological Warfare Unit Sends Out Mournful Sounds" briefly covers unusual themes used over loudspeakers at night in Vietnam. Superstitions are useful to psyoperators because they are closely related to audience predispositions. Also related to audience predispositions, rumors spread because they are congenial to members of the target group and are passed on by them. "Rumors and How to Counter Them" describes how rumors change in the process of being passed on to others and indicates the kinds of defenses that can be used against rumors. In a similar way, "Intra-Group Communication and Induced Change" relates how positive gossip is utilized for spreading ideas and how an established information flow can prevent rumors from spreading.

TACTICS OF DECEPTION IN PSYCHOLOGICAL OPERATIONS*

BY ROBERT I. HOLT AND ROBERT W. VAN DE VELDE

Tactics of deception in psychological operations are often uncertain and become effective in influencing behavior and at the same time maintaining communication credibility only if three general rules are followed.

Tactics of deception attempt to make the audience build up a psychological environment which differs from the material environment. In the terms of perceptual psychology, tactics of deception try to provoke . . . [illusory] percepts. . . .

There are many examples of the use of the tactics of deception. Much of Hitler's success in the late thirties was due to the fact that the official decision-makers in Britain and France defined the situation (particularly in regard to Hitler's goals) in a manner which deviated disastrously from reality.

There were many instances during World War II when deception was used effectively by both sides. Deception is responsible in some degree for the reputation of "evil" which tends to surround the psychological instrument. Indeed, among some people whose understanding of the dynamics of human behavior is meager and whose knowledge of world affairs is parochial, "psychological operations" are understandable only in what they refer to as "the dirty tricks department." All other aspects of the psychological instrument are apt to be scathingly referred to as "globaloney."

One of the most famous and successful uses of deception was the British "Operation Mincemeat"—the case of *The Man Who Never Was*. After the Allies had driven German and Italian military forces from North Africa, the next step in the Allied offensive was obvious to both them and the Germans. Before the Mediterranean could be available for shipping, Sicily had to be taken. The move was so obvious that the Germans could be expected to mass their defensive forces there and make the invasion, even if successful, extremely costly. The value of making the Germans think that the blow would come elsewhere was apparent. Operation Mincemeat was an attempt to do just this.

It involved releasing a corpse, dressed as a major of the Royal Marines, from a submarine off the coast of Spain. A "Most Secret" letter was planted in a dispatch case attached to the body. It appeared to be from General Sir Archibald Nye, the Vice-Chief of the Imperial General Staff to General Sir Harold Alexander, who commanded an army in Tunisia. The letter indicated that there would be a major Allied offensive against Greece. Other documents on the body were designed to lead the Germans

*Excerpts from *Strategic Psychological Operations and American Foreign Policy*, The University of Chicago Press, 1960, pp. 33-35. ©1960 by the University of Chicago. Published 1960. Second Impression 1964. Reprinted by permission of the University of Chicago Press.

to believe that the major was being flown into the Eastern Mediterranean on a plane that crashed off the coast of Spain.

The body was picked up by Spanish officials and the documents handed over temporarily to a German agent who made copies that were sent on to Berlin. After the war, captured documents proved that the German intelligence service believed the documents and convinced the High Command that the Allies would make their major attack in the Eastern Mediterranean. Military and naval forces were sent to Greece and held there even after the invasion of Sicily, because Hitler and the High Command were convinced that the attack on Sicily was diversionary.¹

There were also a number of "black" propaganda operations undertaken by the Allies in World War II which employed the tactic of deception. "Operation Annie" and "Gustav Siegfried Eins" are examples of two radio stations that operated as if they were broadcasting from inside Germany. Their success was predicated on getting the Germans to believe that they were not Allied stations.²

There are three basic rules that must be followed if deception is to be an effective way of influencing behavior. First, the deception must be "reasonable." The success of Operation Mincemeat was due to the fact that it was entirely reasonable that a Royal Marine officer would be flying to North Africa with special messages in a plane that crashed, and that an Allied invasion in the Eastern Mediterranean was a reasonable if not the most likely move from Africa.

A second rule of deception is that there must be no simple way of checking what the facts in the case really are.

A third rule is that the use of deception should not discredit a source which may have valuable future potential. Deception is usually discovered eventually and the more successful the deception the more likely is the source to be discredited. In World War II the "black" Allied station, Operation Annie, was once used to direct a Nazi column into Allied hands. The deception was excellent, but it completely destroyed the future of the station. It is usually unwise to use a newspaper or radio station which built up a large audience for purposes of deception.

SPECIAL OPERATIONS AGAINST THE VIETMINH*

BY EDWARD GEARY LANSDALE

Unusual situations and traditions may provide the opportunity for ingenuity in the development of PSYOP initiations. This account describes the exploitation of an historic moment and of local superstition for PSYOP purposes.

. . . Just before the French quit the city of Hanoi and turned over control to the Vietminh, . . . the Communist apparatus inside the city was busy with secret plans to ready the population to welcome the entry of Vietminh troops. I suggested that my nationalist friends issue a fake Communist manifesto, ordering everyone in the city except essential hospital employees to be out on the streets not just for a few hours of welcome but for a week-long celebration. In actuality this would mean a seven-day work stoppage. Transportation, electric power, and communication services would be suspended. This simple enlargement of plans already afoot should give the Communists an unexpectedly vexing problem as they started their rule.

An authentic-looking manifesto was printed and distributed during the hours of darkness on the second night before the scheduled entry of the Vietminh. The nationalists had assured me that they could distribute it safely because the chief of police in Hanoi was a close friend of theirs and would rescue any of them who might be caught and arrested. The next day the inhabitants of Hanoi read the fake manifesto and arranged to be away from homes and jobs for a one-week spree in the streets. The manifesto looked so authentic that the Communist cadre within the city bossily made sure, block by block, that the turnout would be 100 percent. A last-minute radio message from the Communists outside the city, ordering the Communists inside to disregard this manifesto, was taken to be a French attempt at counterpropaganda and was patriotically ignored. When the Vietminh forces finally arrived in Hanoi, their leaders began the touchy business of ordering people back to work. It took them three days to restore public services. A three-day work stoppage was a substantial achievement for a piece of paper.

* * * * *

[A] second idea utilized Vietnamese superstitions in an American form. I had noted that there were many soothsayers in Vietnam doing a thriving business, but I had never seen any of their predictions published. Why not print an almanac for 1955 containing the predictions of the most famous astrologers and other arcane notables, especially those who foresaw a dark future for the Communists? Modestly priced—gratis copies would smack too much of propaganda—it could be sold in the North before the last areas there were evacuated. If it were well done,

*Excerpts from *In the Midst of Wars: An American's Mission to Southeast Asia*, Harper & Row, Publishers, New York, 1972, pp. 225-227. Reprinted with the permission of the author, copyright owner.

copies would probably pass from hand to hand and be spread all over the Communist-controlled regions.

The result was a hastily printed almanac filled with predictions about forthcoming events in 1955, including troubled times for the people in Communist areas and fights among the Communist leadership. To my own amazement, it foretold some things that actually happened (such as the bloody suppression of farmers who opposed the poorly-executed land reforms and the splits in the Politburo). The almanac became a best seller in Haiphong, the major refugee port. Even a large reprint order was sold out as soon as it hit the stands. My nationalist friends told me that it was the first such almanac seen in Vietnam in modern times. They were embarrassed to discover that a handsome profit had been made from what they had intended as a patriotic contribution to the nationalist cause. Unobtrusively, they donated this money to the funds helping the refugees from the North.

OUR POISON PEN WAR AGAINST THE NAZIS*

BY BRIAN MOYNAHAN

Target audiences will unwittingly expose themselves to propaganda messages and appeals not in line with their predispositions if the messages and appeals are subtle and presented in ordinary, normal, or routine fashion.

One of the most ingenious bits of propaganda used by the Allies during World War II was called "Operation Cornflakes." Its details were never released, and it is still on the U.S. secret list. But recently an international stamp actioneer, Mr. Robson Lowe, came across a sheaf of documents and stamps describing it, and next month they will go on show in South Africa.

"Cornflakes" had a beautiful simplicity to it. Dropping leaflets indiscriminately was expensive and largely ineffective. The Germans knew it was Allied propaganda and treated it as such. But if it were to arrive normally, through the German mail, on their breakfast table (hence "Cornflakes"), then most Germans would think that it had come from a resistance group inside the country. This would be a far more shattering blow to their self-confidence.

The idea, conceived by the Americans, was to bomb mail trains northward bound for the Reich with Italian based P-38 fighter bombers. The P-38s would stop the train and damage it heavily with strafing. Then mail bags containing the propaganda letters would be dropped amongst the wreckage. When they found them, the Germans would presume they came from the train and deliver them as normal mail.

*From *The Sunday Times* [London] 2 May 1971, reproduced in *Falling Leaf Magazine*, XII, No. 2 (June 1971), pp. 64-65. Reprinted with the permission of *The Sunday Times* (London), copyright holder.

A vast amount of work went into the scheme. German POWs who had been postal clerks were questioned on regulations, details of postal cancellations, correct methods of packing and labelling mail sacks. Aircraft of the U.S. 14th Fighter Group, assigned to the mission, practised daily.

Forgery began on a large scale in the summer of 1944. Near-perfect fakes of 12 and 6 pfennig Hitler stamps were run off; a propaganda parody of the stamp showing Hitler as a Death's Head was also made. German envelopes were printed. The material inside looked authentically German; much of it was crudely produced, as one would expect from a clandestine group operating from inside the Reich.

Over two million names and addresses were chosen from the telephone books of Berlin, Dresden, Vienna, Hamburg and Stuttgart. An army of clerks and typists was used to address 15,000 envelopes a week—different typewriters and handwriting had to be used to avoid suspicion.

The first mission was on 5 February, 1945. A mail train on its way to Linz in Austria was attacked, and the engine destroyed. Eight mail bags, each with about 800 letters, were dropped on target. The mail was carefully prepared to coincide with towns on the route of the target train. Envelopes were franked immediately prior to take-off to ensure the correct date appeared.

They were addressed to troops as well as to civilians. A newsletter—*Der Jäger der Sudfront*, the South Front Hunter—was sent to troops on the Italian front. Forged military envelopes had messages from the "League of German Partisans," suggesting that there was a widespread peace movement in the Army. A special newspaper, *Das Neue Deutschland*, was printed and dropped. It was effective enough for Himmler's paper, *Das Schwarze Korps*, to spend two pages denouncing it and its treacherous authors.

The propaganda itself was ingenious and highly varied. "The League of Lonely Women" was invented, which sent combat troops a highly enticing, printed letter. "When are you coming on leave? . . . We are waiting for you in any strange town you may pass through. Cut off the League symbol from the letter. Stick it on your glass when you are in any cafe, in any bar near a station. Soon a member will be with you, and all the traumas of fighting will disappear in the beauty of one night." The kick, of course, came in the tail: Don't be shy, "your wife, sister or loved one is also one of us." Scarcely a thought to keep up the morale of a jealous, worried soldier fighting on the Russian front.

Austrians were urged to master phrases like, "Mei ai slap dse dorti proschn?" (May I slap the dirty Prussian.) But one section shows how serious was the intent behind Operation Cornflakes. "Please Sir, may we hang the Gauleiter ourselves? The executioner lives right around the corner. We will provide the rope. The rope is too thin—too thick—too long—too short. The gallows is not high enough, the Gestapo functionary is too high."

It is almost impossible to tell how effective the scheme was. Only 120

mail bags had been dropped on wrecked trains when the war ended. It is known that copies of *Das Neue Deutschland* reached troops through the German post in Italy, that it was read by troops as far north as the Baltic, and that 90 percent of prisoners who had read it thought it either genuinely came from Germany or from Switzerland. But the secret has been kept too long to check back on the real impact.

RUMORS AND HOW TO COUNTER THEM*

BY WILBUR SCHRAMM

Rumor, limited in its audience, can be a very effective instrument of psychological operations if the communicator has an understanding of how the message is likely to be received by members of the target audience.

One of the best illustrations of how perception works, and also one of the aspects of human behavior that the psywar operator needs to understand most thoroughly, is the growth and passage of rumors. The most extensive work on rumor has been done by Allport and Postman,¹ who have studied the problem not only by observing rumors in society but by setting up experimental rumor passages in the laboratory. One of the rumors they studied during the war had to do with a Chinese teacher on vacation who, shortly before Japan's surrender, drove his car into a Maine village and asked his way to a hilltop from which he could see a view that a tourist guide had told him about. "Someone showed him the way," say Allport and Postman, "but within an hour the community was buzzing with the story that a Japanese spy had ascended the hill to take pictures of the region."

What happened? Someone told the story. It was told over and over again. And as it passed from person to person, three things were happening to it. So, at least, Allport and Postman concluded from their analysis of the case.

In the first place, it was being *leveled*. Details were being omitted:

The courteous and timid, but withal honest, approach of the visitor to the native of whom he inquired his way; the fact that although he was certainly Oriental his precise nationality was unknown. Likewise not mentioned was the fact that the visitor had allowed himself to be readily identified by people along the way; and that no one had seen a camera in his possession.

In the second place, the story was being *sharpened*:

Having accepted their special interpretation of the Chinese scholar's visit, the rumor agents accentuated certain features while minimizing others. The sharpening of selected details accounts for the overdrawn dramatic quality of the final story. What in the original situation was Oriental became specified as Japanese; what was merely a "man" became a special kind of man, a "spy." The harmless holiday pursuit of viewing the scenery became the much sharper, sinister purpose of espionage. The truth that the visitor had a picture in his hand became sharpened into the act of "taking pictures." The objective fact that no pictures of any possible value to the enemy could be taken from that particular rural location was overlooked.

*Excerpts from *The Nature of Psychological Warfare*, Operations Research Office, The Johns Hopkins University, Chevy Chase, Md., 1953, pp. 64-68.

In the third place, the story was *assimilated*:

In the Maine countryside resident natives have had little contact with Orientals. Like most Occidentals they are unable to distinguish a Chinese person from a Japanese. They had only one available rubric for Orientals, firmly implanted in their minds by wartime news and stories: the "Japanese spy." No other category was available for the classification of this unusual visitation.

A Chinese teacher-on-a-holiday was a concept that could not arise in the minds of most farmers, for they did not know that some American universities employ Chinese scholars on their staffs and that these scholars, like other teachers, are entitled to summer holidays. The novel situation was perforce *assimilated* in terms of the most available frames of reference.

This process—leveling, sharpening, and assimilation—seems to characterize the passage of all rumors. You can test it yourself, as Allport and Postman did, by playing a kind of parlor game: write a brief story; then whisper it word for word to a guest, who will whisper it to the guest on the side of him, and so around the room. When the story comes back to you, compare it with the original. This has been done in the laboratory many times, in the transmission of both pictures and words, and the same general principles of perception seem to apply.

Consider what was happening in the incident of the Chinese teacher. The villagers were trying to give the incident a meaning. They perceived those details that added up to a meaning, selecting some details, rejecting others, distorting some, adding some (for example, the camera). The important question, of course, is this: what controlled their selection? They were obviously selecting in terms of the frames of reference available to them (which did not include Chinese teachers on vacation in Maine), and in terms of their needs, moods, and anxieties at that moment. The war was much on their minds. Japanese were objects of fear, distrust, and hate. Protecting their country was a high value of great importance to them. Their suspicion of foreigners was of long standing. They had been exposed to the Government's campaign for security of information, to spy movies, to the knowledge that cameras were prohibited around defense installations. And all this added up to a frame of reference, in terms of which they perceived this new event. As Allport and Postman put it:

A yellow man—a Jap—a spy—photographic espionage. One idea led to the other with almost mechanical inevitability until the final conclusion emerged The three-pronged process of leveling, sharpening, and assimilation reflects the rumor agents' "effort after meaning." The facts of the situation, but dimly understood, did not provide the meaning that the strange visitation required. Hence a single directive idea took hold—the *spy motif*—and in accordance with it, discordant details were leveled out, incidents sharpened to fit the chosen theme, and the episode as a whole assimilated to the pre-existing structure of feeling and thought characteristic of the members of the group among whom the rumor spread.

Rumors are clearly an important weapon of psywar. But let us look at them here only in terms of the perceptual processes they illustrate and of what they mean to the psywar operator who wants to know how a message is likely to be received.

If you want to anticipate how an intelligent enemy will defend himself you can look at some of America's experiences in rumor defense during World War II.

In general, this country used two kinds of defense against rumor. The government agencies preferred the indirect method of smothering rumors with facts, that is, they did not repeat rumors even for the purpose of refuting them. The theory behind this defense is (a) that "rumor flies in the absence of news" and (b) that to repeat a rumor even for refutation may spread it farther. Therefore agencies like OWI, when they learned of a dangerous rumor, would release facts in answer to it without ever mentioning the rumor.

On the other hand, nongovernmental organizations and civilians put their faith in rumor clinics, which chiefly took the form of newspaper columns or radio programs in which rumors were selected for ridicule and refutation. The theory here was to bring rumors out into the open into a climate of fact and understanding, where they could not flourish. Such evaluation and study of these rumor clinics as was made indicates that (a) there was no evidence that newspaper rumor clinics, filled with ridicule and negation as they were, actually served to spread any rumors farther; (b) however, it was regarded as possibly dangerous to print a rumor in bold-face type, or to repeat the rhythms and slogan-like qualities of some of the more effective rumors; (c) it was felt that radio rumor clinics were more likely than printed clinics to spread a rumor, because of the dial-twisting habits of American listeners; and (d) there was some slight evidence that the clinics impeded the spread of rumor, and no doubt whatsoever that they succeeded in making their communities rumor-conscious.

Along with these defenses, of course, there was a poster, newspaper, and radio campaign aimed at security of information. Typical slogans were "Think before you talk," "Enemy ears are listening," "Don't kill her daddy with careless talk." This is standing operating procedure (SOP) for any country at war.

"PRACTICAL JOKES"*

BY EDWARD GEARY LANSDALE

Some inactive avenues are opened when PSYOP is thought of as an opportunity to play "practical jokes." Results often justify the concept.

Conventional military men think of combat psywar almost exclusively in terms of leaflets or broadcasts appealing to the enemy to surrender. Early on, I realized that pyswar had a wider potential than that. A whole

*Excerpts from *In the Midst of Wars: An American's Mission to Southeast Asia*, Harper & Row, Publishers, New York, 1972, pp. 71-75. Reprinted with the permission of the author, copyright holder.

new approach opens up, for example, when one thinks of psywar in terms of playing a practical joke. We all know that many people risk their lives and safety to paint slogans and appeals on walls in forbidden territory, motivated as much by anticipation of the antics of their outraged enemies as by ideology or patriotism. Low humor seems an appropriate response, somehow, to the glum and deadly practices of Communists and other authoritarians. (I recall a case in Europe once, when militant youths were to partake in a massive street demonstration. The Communist party had followed the book, systematically placing its cadre to incite the demonstrators into acts of violence. Police and military forces were ready to prevent this with tear gas, rifles, and bayonets. But bloodshed was avoided. A ribald benefactor brought out cauldrons of hot chocolate and coffee and invited the would-be demonstrators to share his brews—which he had laced generously with a powerful laxative. The militants found themselves with more urgent business to attend to than street brawls.) When I introduced the practical-joke aspect of psywar to the Philippine Army, it stimulated some imaginative operations that were remarkably effective.

To the superstitious, the Huk battleground was a haunted place filled with ghosts and eerie creatures. Some of its aura of mystery was imparted to me on my own visits there. Goosebumps rose on my arms on moonless nights in Huk territory as I listened to the haunting minor notes of trumpets playing Pampanguena dirges in the barrios or to the mournful singing of men and women known as *nangangaluluwa* as they walked from house to house on All Saints' night telling of lost and hungry souls. Even Magsaysay believed in the apparition called a *kapre*, a huge black man said to walk through tall grass at dusk to make it stir or to sit in a tree or astride a roof smoking a large cigar.

One psywar operation played upon the popular dread of an *asuang*, or vampire, to solve a difficult problem. Local politicians opposed Magsaysay's plan of moving more troops out of defensive garrisons to form further mobile and aggressive BCTs [battalion combat teams], and in one town the local bigwigs pointed out that a Huk squadron was based on a hill near town. If the troops left, they were sure the Huks would swoop down on the town and the bigwigs would be their victims. Only if the Huk squadron left the vicinity would they agree to the removal of the guarding troops. The problem, therefore, was to get the Huks to move. The local troops had not been able to do this.

A combat psywar squad was brought in. It planted stories among town residents of an *asuang* living on the hill where the Huks were based. Two nights later, after giving the stories time to circulate among Huk sympathizers in the town and make their way up to the hill camp, the psywar squad set up an ambush along a trail used by the Huks. When a Huk patrol came along the trail, the ambushers silently snatched the last man of the patrol, their move unseen in the dark night. They punctured his neck with two holes, vampire-fashion, held the body up by the heels,

drained it of blood, and put the corpse back on the trail. When the Huks returned to look for the missing man and found their bloodless comrade, every member of the patrol believed that the *asuang* had got him and that one of them would be next if they remained on that hill. When daylight came, the whole Huk squadron moved out of the vicinity. Another day passed before the local people were convinced that they were really gone. Then Magsaysay moved the troops who were guarding the town into a BCT.

Another combat psywar operation used the "eye of God" technique, which I had heard about when it was used at the siege of Caen, and from its use by spotter aircraft-loudspeaker tank teams in World War II in Europe. The idea was to get exact information about the enemy and then broadcast it through loudspeakers in combat situations, making individual enemy soldiers feel that they couldn't hide from an all-seeing eye and had to follow the directions of the broadcasts. In the siege of Caen, a German officer would be told by name that he was the next to die because he refused to surrender, and moments later an artillery shell would hit his house or headquarters. In the air-tank technique, the loudspeaker tank would call out to German soldiers hidden in defensive positions but visible from the air, claiming to see individual soldiers, describing what they were doing at the moment, announcing that they didn't have a chance, and telling them to come out and surrender. Both examples made effective use of fresh combat intelligence about the enemy.

The only equipment that the Philippine Army had for making broadcasts to Huk guerrillas under combat conditions was a handful of U.S. Navy loud-hailers (bull horns), designed for use by beachmasters in amphibious landings, which I had scrounged in Washington and brought with me. I had planned for them to be used by infantry, but it was found that they could be used from the light liaison aircraft assigned to BCTs, when flying at low altitudes. . . . I had distributed this equipment to each of the first BCTs formed. One day, a Philippine officer made use of the bull horn, the light aircraft, and the "eye of God" technique in an unusual way, thanks to his BCT's collection of detailed information about the enemy.

On this day a Huk squadron was being pursued by an infantry company from a BCT, which had not been able to make contact with the elusive guerrillas. The officer went up in the aircraft to see if he could spot the Huks from the air. He saw them, and he saw also that his troops were helplessly, behind in their pursuit. Frustrated, he looked around in the aircraft for something to throw at the Huks below him—and found a bull horn stowed behind the seat. Inspiration came. Through the bull horn he shouted down at the Huks below, telling them that they were doomed because he and his troops knew all about them and soon would catch them. He cudged his brains for what the BCT's intelligence officer had told him about this Huk squadron, and he remembered some of the names on its roster. He called down to the Huks by name, pretending to

recognize individuals. As the aircraft made a final circle, the bull horn sent his amplified voice down with these parting words: "Thank you, our friend in your squadron, for all the information." Then he flew away chuckling over his final broadcast. The BCT found out later that the mention of a mysterious "friend" in their ranks had aroused the Huk's darkest suspicions of one another. Three of them were singled out and executed on the spot. The words had inflicted as many casualties on the enemy as troops could have done in a running fight.

The name of this technique, "the eye of God," reminded me of the ancient Egyptian practice of painting watchful guardian eyes over the tombs of the pharaohs. The painting was stylized to give the eye a baleful glare to scare away grave robbers. Recalling its appearance, I made some sketches until I recaptured the essence of its forbidding look, and I handed over the final drawing to the Philippine Army with suggestions for its use. It was mainly useful in towns where some of the inhabitants were known to be helping the Huks secretly. The army would warn these people that they were under suspicion. At night, when the town was asleep, a psywar team would creep into town and paint an eye on a wall facing the house of each suspect. The mysterious presence of these malevolent eyes the next morning had a sharply sobering effect.

INTRA-GROUP COMMUNICATION AND INDUCED CHANGE*

BY ARTHUR H. NIEHOFF

The establishment of efficient information flow between the communicator and the target audience can assist the communication in two ways: it can be used as a communication feedback mechanism for warding off rumormongering; it can be used as potentially routine gossip for spreading ideas.

The one absolutely essential technique [in helping to produce adoption of new ideas or practices in developing areas] is the establishment of effective communication, for it is the means by which knowledge of the new idea or practice is transferred. . . . We believe there are, basically, three types of relevant communication: input, the movement of information from the change agent to the potential adopters; feedback, the response from the potential adopters back to the change agent; and gossip, or intra-group communication, among the potential adopters regarding the innovation. . . .

Although a change agent may establish channels of communication to transfer his ideas to potential adopters (input), as well as channels for feedback, the interaction process does not stop at this point. When any significant event occurs in a local community, the members of that community invariably begin a process of communication about it among

*Excerpts from "Intra-Group Communication and Induced Change," Professional Paper 25-67, Human Resources Research Office, The George Washington University, Washington, D.C., June 1967, AD 654124, pp. 1-9.

themselves. We wish to show that such informal conversation, or gossip, is a powerful force in the process of decision-making in small groups, and thus is significant to induced change projects.

* * * * *

[One] project in which intra-group [or informal] communication was instrumental in helping achieve the goals set by the change agent was an effort to promote modern household practices in Southern Uganda through the establishment of women's clubs.¹ The change agent's first step was to hold a meeting of interested people, including men, in a local house, school, or community hall. She would give a talk on the proposal and answer all questions, after which the women could decide whether they wanted a club. If a club was established, regular teaching sessions, particularly in sewing, were begun. The women had to pay the equivalent of ten cents per week for membership and buy their own cloth. There were perceived practical benefits, both in the clothing the women were able to make for themselves, and in small rewards, such as needles and thread. An additional motivation was the status obtained by being a member and having a club in the community. The local chiefs came to feel "behind the times" if they did not have such a club in their district. This came about primarily as a result of the gossip of the women about their activities, substantiated by showing off their new dresses. Consequently, within a four-year period 40 such clubs were organized with 30-50 members each.

Except for a few projects in which information was given to students with the hope that they would transmit it to their parents, we found only one in which the change agents consciously depended on gossip as a means of spreading an innovation.² This was a pilot project in family planning in Taiwan, and, not surprisingly, the change agents were communication specialists. The change agents used a wide variety of communication techniques at first, but depended on female gossip to carry the knowledge beyond the families contacted directly. An evaluation study later revealed that about 20 % of the women who accepted contraceptives had never been directly contacted by the change agents but had learned about the innovation through gossip.

Most of the projects during which harmful rumors were reported succeeded despite the malicious gossip. However, most of these rumors occurred in the initial stages of the projects' implementation and their effects were neutralized by improved communication. Probably in most instances where rumors were instrumental in halting projects, the change agents never learned of their existence.

Almost all the rumors were a result of communication insufficient for the local people to learn the projects' goals clearly, added to their basic skepticism toward powerful outsiders. It is hypothesized that rumors will rarely occur if there is efficient communication input and feedback. If local people feel confident enough in their relationships with outsiders to express their opinions of proposed changes, they need not depend exclusively on generation of explanations with one another. Unfortunately,

such feedback channels frequently do not exist, and when they do not, rumors can be expected to occur. These will probably tend to be malicious or harmful to the projects' goals in proportion to the perceived threat of the outside influences.

Some harmful rumors that we have found in published case histories sound far-fetched, but they give an indication of what local people think when they are first approached with a novel idea, only partly communicated, that they perceive as potentially dangerous. An illustration of this occurred in an early hookworm treatment campaign in Ceylon.³ Information was initially collected [about] the incidence of the disease, which made the villagers uneasy, as they were afraid it was being collected for tax or military draft purposes. When treatment, which was free, was offered, it was in the form of capsules. The rumor was generated and spread that the capsules contained little bombs which would explode after being swallowed. In spite of this, due principally to the establishment of better communication and the utilization of local leaders to sanction the idea, treatment was later accepted by many. Probably what is most significant in regard to this rumor type is that peasant villagers are usually very suspicious of information collectors unless relatively durable contacts are established.

Another series of harmful rumors emerged in a community development project in Cali, Colombia, again where there was inefficient communication of the project's goals and a perceived threat to the local way of life.⁴ The potential participants were squatters in urban slums who lacked confidence in municipal authorities, since their community had been neglected for years. Because they had no legal title to their land, they were afraid that the suggestions to build a bridge, road, and drainage canals were preparations to convert their neighborhood into a residential zone for the wealthy. In particular, their fears grew when the change agency began conducting a survey of the local environment. However, these fears were allayed by persistent efforts to inform the local people that the real goal was improvement for the squatters themselves and by adroit utilization of local leaders to sanction the project. Ultimately the physical improvements were carried out on a self-help basis through locally organized committees.

Potential loss of land is undoubtedly one of the most vital fears of the poor people in non-industrial countries, whether these are slum squatters, village peasants, or tribal people. Another project where this type of fear occurred was a community development effort in Nigeria.⁵ Although the goal was to build roads, schools, bridges, markets, and other communal structures, some land was usually involved. A number of villagers dropped out in the first stages because of a rumor that the whole project was merely a pretext to take away people's land. Another rumor based on fear of losing land occurred in a land rehabilitation project in Jordan, where the Bedouins thought the construction of dikes and growing of grass was to settle refugees from Palestine.⁶

In all the cases except the land rehabilitation project in Jordan, the goals were in the main achieved, and in all instances the way this was done was by improving communication with the potential adopters and/or by working through local leaders. We wish to reemphasize the significant fact that in these cases the rumors were known, and that similar or more damaging ones usually occurred in projects which failed but were not learned about because communication was not effectively established.

In summary, it is our belief that gossip, or intra-group communication, has two facets of significance to the change process. Positive gossip, favorable to project goals, is an index of the establishment of efficient information flow, both of communication input and feedback, as well as a perception by villagers that the project goals would be beneficial to them. Moreover, such gossip can be deliberately used by change agents as a method of information dissemination.

Negative gossip, or rumormongering, is a product of lack of information flow between the change agent and the potential adopters and/or no perceived advantages from the project goals by the local people.

CHAPTER IX

PSYOP EFFECTIVENESS

In the evaluation of psychological operations the analyst can now employ tools and methodologies unavailable before the computer age. Moreover, specialists have conceptualized the process of communications in ways more amenable to social science and related research¹—research in sociology and psychology, for example—which has led to new understanding of “hows” and “whys” in the study of persuasive communications.

Perhaps the most common approach to the communications process is the question framed by Harold D. Lasswell:

“Who	[Sources]
“Says What	[Content]
“In Which Channel	[Media]
“To Whom	[Audience]
“With What Effect?	[Effect]” ²

Although weaknesses in the formula have been cited by many scholars, the Lasswell model has not been replaced by one that approaches it in adherents. For that reason, the functional categories of the Lasswell model have been used, in slightly rearranged format, in this chapter: Source, Content, Audience, Media, and Effects—or SCAME.*

Apart from the enthusiasm demonstrated by the proponents of particular theories or procedures, dissatisfaction with the analysis of PSYOP is widespread. Theoretical models and concepts are in dispute, and basic questions of definition are also subject to debate. Even in the face of methodological progress, “there are,” as David Robinson points out, “few, if any, technically acceptable criteria for the evaluation of psychological warfare programs. . . .”³

The dissatisfaction with the state of the analytical art in PSYOP is especially pronounced in evaluation of effectiveness. The many studies of source, message, channel, and receiver factors in attitude change are inconclusive or have led to inconsistent conclusions.

To understand the effects on persuasion of manipulations such as communicator credibility or distraction, a number of stages in the persuasion process must be considered. . . . Needless to say, a large body of conflicting findings must result from . . . accumulation of confounding factors: different types of messages, different dependent variables, different assumptions linking the supportive message to the dependent measure of persuasion, and failure to measure acceptance of supportive beliefs or indirect effects of the message.⁴

These shortcomings must be judged against the methodological and conceptual advances adverted to previously, advances which have enabled analysts to better understand attitude change processes. Further progress in these areas of advance is prerequisite to the development of adequate evaluative programs for PSYOP.

*This approach has also been employed in the Army field manual, FM 33-5, *Psychological Operations—Techniques and Procedures*, Chapter 9.

The essays in this chapter, organized along the SCAME formula, provide methodological, analytical, and illustrative insights into the evaluation of persuasive communications.

INTRODUCTION

A BRIEF REVIEW STUDY OF THE PROBLEMS OF CRITERIA IN PSYCHOLOGICAL WARFARE*

By DAVID D. ROBINSON

There are presently few acceptable criteria for PSYOP evaluation. Various techniques of evaluation have been utilized, but no scientific approach for the evaluation of an entire PSYOP program has been found. Perhaps the most that can be aspired to in the current state of the art is evaluation of individual parts of a total PSYOP program.

FOREWORD

At the present time [1967] there are few, if any, technically acceptable criteria for the evaluation of psychological warfare programs, nor are there adequate techniques available for developing criteria for the evaluation of a *total* psywar program. A number of criteria have been used to evaluate selected aspects of psywar in the past, but most have been unsatisfactory for reasons that will be discussed. In most areas of behavioral science, the problems of criteria remain unsolved, but when situations are highly structured and well defined, and a reasonable degree of experimental control is possible, adequate criteria can be constructed. To the extent that such definition and control are lacking, so are the possibilities for developing adequate criteria. War, by its very nature, prevents the investigator from structuring the situation to any great degree and from being able to control the relevant variables. Mainly for this reason, the state of the art of the development of criteria for the evaluation of psychological warfare is low.

This report will examine some of the problems associated with the evaluation of psychological warfare using examples since World War II. It is necessarily of limited scope, and the review of the open and classified literature has not been exhaustive; nevertheless, it is possible to make

*Prepared for the Advanced Research Projects Agency, Office of the Director of Defense Research and Engineering, by the Remote Area Conflict Information Center, Battelle Memorial Institute, R-896, March 10, 1967.

definite conclusions about the state of the art of criterion development in psywar.

* * * * *

AN INTRODUCTION TO THE PROBLEM

The proof of the effectiveness of most of the techniques of applied behavioral sciences, including those of psychological warfare, rests on the ability to provide adequate criteria of effectiveness. The criterion is the crucial element in most studies of effectiveness, but it is surprising to note the dearth of adequate research or pertinent articles in the professional literature on this subject. Obviously not all the problems of criterion definition or criterion development are resolved, and yet there has been a diminution of interest in the area. For example, the index for the *Psychological Abstracts* shows the following number of entries under the heading "Criterion" for the following years:

1951	7
1952	0
1953	6
1954	6
1955	11
1956	5
1957	2
1958	1
1959-65	1

This dearth of entries suggests neither attraction nor interest in this vital area. One investigator has remarked that we often act as though criteria are either God given, or just to be found lying around somewhere.¹

This deficient state of our knowledge has been discussed in many quarters, and pleas for attention to research in the area are heard on every hand. It is frequently stated that much more attention is given to the construction of predictor elements, for example, than in the development of criteria. We find ourselves with predictors that have been refined to a psychological hair—reliability coefficients on the order of 0.90, successive attempts to increase reliabilities by a few points, and elaborate attempts to establish norms; but still we are tied to primitive criteria in most cases. In the sphere of psychological warfare, the problem is especially acute. A critical examination of methods used to evaluate psywar programs since World War II follows.

AN EXAMINATION OF METHOD USED TO EVALUATE PSYWAR PROGRAMS SINCE WORLD WAR II

Many psywar programs have developed haphazardly, and evaluation of their success, in cases where evaluation has been attempted, has not been scientifically rigorous. There are cases in which psywar activities have been totally unsuccessful. In one instance, an aircraft was outfitted with a loudspeaker system and used for four months before it was discovered that the broadcasts were totally inaudible to people on the ground.² Other

cases are on record in which techniques produced results directly opposite to those intended. FM 33-5, "Psychological Warfare Operations", presents only a skeleton account of effects analysis.³ Obviously a need for a program of criterion development exists.

Daugherty⁴ has pointed out three major reasons why evaluation efforts of the past have been of limited value. First, those who have been responsible for psychological operations or for post-operation evaluation have not possessed a clear and consistent understanding of the nature and mission of the activity. Second, no clear or acceptable criteria exist for measuring psychological effects except in limited situations. Third, even if the problems of psywar were understood, and even if adequate tools were available for effectiveness measurement, there would be other factors that would greatly limit the success of evaluators, e.g., combat conditions, logistical problems, etc., which would bring about inevitable compromises with scientific rigor.

Assessing the Impact of Psywar Efforts

Among the methods of evaluating the success of psywar efforts have been the following: content analysis of intercepted mail, captured military documents, monitored radio broadcasts, newspapers and magazines printed in the target area; questionnaires and interviews of captured enemy personnel or of enemy civilians in areas recently coming under friendly control; and observation by nonparticipant or participant observers. Most of these methods suffer from two problems: the lack of representative sampling and the lack of an integrated approach to evaluation. Adequate samples can be drawn of enemy civilians living in areas controlled by friendly forces, but several problems are encountered: often they are unwilling to cooperate and in many instances a period of time has intervened between reception of psywar messages and their capture. The fragmented approach to evaluation could be improved if each method could be weighted according to its worth and employed accordingly. These methods are indirect, but are probably as direct as one could hope for since target populations are usually hostile and therefore unapproachable. One segment of the enemy population is approachable, however, and often serves as subject for research: that of prisoners.

Prisoners of War

Prisoners of war have been used in the evaluation of psywar materials, but the tendency has been to give undue weight to this group. The difficulty in generalizing from the prisoner group to the enemy population is that the prisoner group is not a representative sample of the total enemy population. The very fact that a man is captured may reflect an inherent difference between him and his comrade who has managed to evade captivity. Once captured, even the nearly successful evader may change psychologically. For him the war is over. Good food, safety, medical treatment, and so on may change his attitude significantly, espe-

cially after the initial fear of death and torture at the hands of his captors has dissipated.

Shils and Janowitz⁵ developed a taxonomy of social disintegration within the Wehrmacht during the closing days of World War II which could be of value in judging surrender behavior. . . :

1. Desertion
 - a. Individual
 - (1) After discussion with comrades
 - (2) After no discussion
 - b. By groups in concert
2. Active surrender (deliberately signaling, sending emissaries, etc.)
 - a. Individual
 - b. By the group as a unit
 - (1) By mutual agreement
 - (2) By order of, or with approval of, NCO or officer
3. Passive surrender
 - a. By individuals acting alone
 - (1) Non-resistance
 - (2) Token resistance
 - b. By plurality of uncoordinated individuals
4. Routine resistance
5. Last-ditch resistance

This taxonomy could be used as the basis for a scale of "willingness to fight" which could be related to the intensity of their exposure to the psywar campaign.

Efforts to find grist for the psywar mill have sometimes involved interviewing prisoners to find why they surrendered. This technique can be effective, but there are potential problems in using it. It is often impossible to ascribe motives to a surrendering prisoner since he, himself, may be unaware of the reason for his surrender. Was it because of fatigue, hunger, lack of ammunition, or other "objective" factors; or was it because he became "fed up" with the war because of exposure to psywar ploys? It has been pointed out that prisoners will not admit to deserting or allowing themselves to be captured because of guilt feelings over dereliction of duty. They would rather admit to "falling asleep in a cellar and waking up in the midst of enemy troops" or "getting lost and blundering into the enemy" than admitting that they sought out the enemy and surrendered to him. There have been cases of enemy commanders refusing to surrender towns or fortifications until a single shell was fired into it.⁶ Such symbolic resistance is a balm to the conscience of surrendering forces.

"Most Like" and "Qualified Judge" Approaches to Pretesting

The psywar operator is faced with the problem of obtaining accurate information about large populations without systematic use of the populations. There are two possible approaches to solving the problem which

may be called the "most like" approach and the "qualified judge" approach. The most-like approach consists of using respondents who, while not being "the same as" the target population, can be considered most like it. The rationale is that people who are culturally similar will be psychologically similar—a tenuous assumption—but perhaps a necessary one. In order to evaluate the effects of broadcasting to [the People's Republic of] China, for example, the broadcasts could be pretested on refugee groups, citizens of Taiwan, or, if the budget was low, Chinese living in the United States. The second approach, the qualified-judge approach, involves asking a person who knows the group in question to make certain estimates about the inaccessible group. In the example above, a person grounded in Chinese history, language, religion, and other aspects of that culture may serve as the qualified judge.

Sometimes enemy prisoners are used as most-like groups, but there are pitfalls in this approach. Pretesting inevitably involves some question-and-answer procedure, but when the cultures of the interrogator and the subject are different, the reliability and validity of the responses may be compromised. For example, as Daugherty has pointed out:

The average person in Asia, including those who serve in the armed forces of their country, is a simple-minded, semiliterate individual, who is seldom if ever consulted for opinions on any matter.

Thus when someone approaches him concerning his views on the contents of a proposed communication, he understandably may hesitate to go on record as either approving or disapproving a suggested course of action. He surely would hesitate to express an adverse opinion on any action he believed to have originated on a higher level in the social scale from that which he occupies.

Almost universally when such individuals are asked to talk about such matters, there is an apparent eagerness to say that which is designed to please the questioner. As a matter of fact, in all Oriental societies it is considered to be a mark of bad manners for one to appear to be vocally critical of the efforts of another, especially if expressed openly to his face. Among prisoners of war there is likely always to be the further consideration that one should not slap the hand that feeds him.

The people in Asia have been told for centuries what to do, and in many cases what to think. The democratic precepts of the worth of individual opinions are entirely foreign to an Oriental's mental processes. Among the more highly educated classes, basic concepts of politeness prevail to such an extent that they are apt to color any expressions of opinion that are made. Under the very best of conditions it is difficult to get more than a rough approximation of what an Oriental thinks on a controversial item by questioning him about it.

Working through native interpreters further complicates the procedure, for the interpreter, in common with his fellow countryman, will hesitate to be brutally frank at the cost of being seemingly impolite. There is also the further problem of being certain that the ideas are communicated accurately in interpreting what is asked and in reporting the answers given.⁷

The qualified-judge approach suffers from the obvious handicap that the judge may suffer from nearsightedness, bias, or any of a number of ills to which human judgment is subject. Yet, in the absence of a most-like group, or an actual sample of the target audience, the qualified-judge approach may be the only one available.

Examples of Effectiveness Research

There have been no systematic, i.e., controlled, studies of the effec-

tiveness of a total psywar effort, but there are a scattered few that consider a portion of the total. One of the best examples of a controlled study of effectiveness is a study by Andrews, Smith, and Kahn.⁸ These investigators hypothesized that the fundamental effects of psywar can be characterized in psychological form, and that they are predictable in terms of the attitudes, motives, and experiences of the recipients. It was also hypothesized that psywar efforts can affect an individual only in certain optimal conditions. They developed scales that attempted to measure nine factors, including the degree to which the individual, before the Korean War, was in accord with the ideology and war aim of the Peoples Government; the degree to which, and frequency with which, the individual had experienced intensive fear during battle; the degree to which the individual felt he had been poorly treated and physically cared for by his own forces during the war, and so on. Two of the nine scales were criterion scales which measured his willingness to defect or surrender. The scales were intercorrelated (each scale was correlated with every other scale) and subsequent analysis appeared to corroborate the major hypotheses. This study was replicated using another target group, Communist Terrorists in Malaya, with essentially the same results.⁹

A number of studies have investigated the effectiveness of radio broadcasting and films, and their methodologies are similar. In the usual case, groups are assembled and hear tapes of the broadcasts. After hearing the tapes, they either discuss the merits and shortcomings of the broadcast in a panel discussion or in individual interviews, or variations thereof. The lack of precision and control in such procedures is evident, but they could be useful in preliminary work.

Evaluation of psywar efforts has largely been a catch-as-catch-can proposition. Most of the evaluative follow-up work, when there has been evaluation, has come as an afterthought or as a more-or-less unplanned adjunct to psychological and non-psychological military operations. To date, there has not been a concentrated effort to develop criteria of success, and this is one of the reasons why previous efforts have come up with so little.

SUMMARY AND CONCLUSIONS

At the present time there are few, if any, technically acceptable criteria for the evaluation of psychological warfare programs, nor are there adequate techniques available for developing criteria for the evaluation of a *total* psywar program. Most psywar programs have developed haphazardly, and evaluation, if it has been undertaken, has not been scientifically rigorous. Those who have attempted to research the problem have not had the responsibility for psychological operations and have not possessed a clear and consistent understanding of that activity, and the very nature of war has prevented the precision and control necessary to obtain adequate measures.

Some methods of evaluation have been tried using content analysis,

questionnaire and interviewing techniques, and observation by nonparticipant or participant observers. Prisoners of war have been used as "most like" groups, but they are not always satisfactory because they are not representative of the enemy population as a whole.

It is probably impossible to develop a criterion to evaluate the success of a total psywar effort because of the extreme complexity of the subject. However, selected aspects of the psywar effort can probably be evaluated with techniques we have at hand, if proper consideration is given to the difficulties inherent in the task, and if the shortcomings of past efforts are heeded. However, it is clear at this point that we have many more questions than answers.

THE PUEBLO FILM*

BY THE 7TH PSYOP GROUP

This analysis of a North Korean film illustrates the integrated use of the SCAME formula for evaluative purposes.

SUMMARY

Much propaganda "hay" has been made by North Korea of the capture of the USS *Pueblo*. *Pyongyang* wire service mentions the "intrusion of the U.S. imperialist armed spy ship" almost daily. The domestic daily newspapers, *Nodong Sinmun* and *Minju Chosen*, also give extensive coverage to the circumstances surrounding the *Pueblo*. The two dailies are a Party organ and a Government organ, and, therefore, propaganda oriented. North Korea also sends propaganda abroad, especially when, in the NK view, such a U.S. vulnerability as the *Pueblo* can be exploited.

*Excerpts from "The Pueblo Film," 7th PSYOP Group, 15th PSYOP Detachment, "Communist Propaganda Trends," SD 69-13, 22 August 1968.

The magazine, *Korean Youth and Students*, No. 92, 1968, gave the crew's confessions and carried pictures of the captured crew members. *Pyongyang Times* gave extensive coverage to the capture and subsequent happenings. However, North Korean propaganda aimed at foreign targets reached its zenith in a film produced by "2.8 Studio" of the North Korean People's Army (KPA) entitled "*Pueblo*, Armed Spy Ship of the U.S. Imperialist Aggressors."

This film is probably one of the most traveled films in the world. It has been shown in Communist and non-Communist countries throughout the world.

* * * * *

Recently, the film found its way, or rather, it was directed on its way by North Korean Communists, to the Japan-North Korea Association in Japan. Here, the Nihon Broadcasting Corporation (NHK) televised the hour long film in an abbreviated twenty minute capsule. This was the first known public showing of the film outside North Korea. The NHK narrator introduced the film in the Japanese language; however, the actual North Korean film was in English. This included the narration by the North Koreans and the voices of various officers and crewmen.

Since video-taping procedures are rather simple, it was possible for non-official Americans, for the first time, to view this piece of North Korean propaganda. North Koreans, as is well known, say the *Pueblo* was in territorial waters, and claim that the crew admits this. This analysis does not delve into the pros and cons of this claim. Nor will any effort be made about the possibilities of "brainwashing" or coercion to get the crew's confession and appeal to President Johnson.

The purpose of this paper is to analyze the film as propaganda, to describe, in empirical terms, the appearance of the crew and their environment, and in conclusion, compare the film with other North Korean propaganda methods and themes.

The analysis of the propaganda film will follow the "SCAME" formula. That is, the analysis will be made in regard to Source, Content, Audience, Media, and Effects.

[SOURCE ANALYSIS]

The source of this propaganda is identified by the narrator as the 2.8 (founding day of KPA) Studio of the North Korean People's Army. This, it would seem, gives credibility to the film since the KPA is the source. The KPA, which includes all North Korea's military services, captured the *Pueblo*. KPA identify closely with the North Korean Labor Party (KLP), which is, in turn, easily identified with Kim Il-song, who is said to have founded KPA and KLP. Therefore, the credibility of this film is enhanced since the source captured the *Pueblo*, and who else could better film the story? KPA is closely identified with the North Korean leader, Kim Il-song. In summary, the source, KPA, is an indication that the film

originated from an official voice. This gives the film a more potent effect than might be the case of a supposed commercial film.

[CONTENT ANALYSIS]

Content analysis of the film's script is based on a direct translation of the Japanese language narration of the film. The subject matter of this film can be divided into four categories:

1. The *Pueblo*, acting under orders from the U.S. Government, intruded into North Korean territorial waters.
2. The *Pueblo* was engaged in espionage activities against North Korea.
3. The United States Government must apologize for this activity.
4. The crewmen are being treated well by the North Korean Government.

The North Korean method of describing these four categories is the next step in a content analysis. The first category, the *Pueblo* intruded into North Korean territorial waters, is "proven" by several methods. The captain of the *Pueblo*, Commander Lloyd Bucher, admits that he "intruded deep into the territorial waters of the Democratic People's Republic of Korea . . ." He also states that the *Pueblo* sailed within 7.6 miles of Ryodo Island. Then the navigator, Navy Lt. Murphy, describes both verbally and visually, by tracing on a wall map, the course of the *Pueblo* and its intrusions into North Korean territorial waters. From the script, one can distinguish at least six intrusions as described by Murphy.

The final bit of North Korean evidence of a territorial-water intrusion was in the letter signed by the crew and addressed to the President. The letter states that the U.S. must admit "the *Pueblo's* infiltration into the North Korean territorial waters." The film shows the officers and crew filing by to sign this appeal to the President.

The fact that the *Pueblo* was acting on orders from Rear Admiral Johnson, U.S. Navy, is attested by Captain Bucher. He said that he was to collect various oceanographic information in the "the territorial waters of the Democratic People's Republic of Korea with radars and various kinds of observatory instruments in a clandestine manner at Chongjin, Wonson, and several other points." And in the letter to the President, it is stated again that the assignment of the *Pueblo* was given by the U.S. Government.

The second content category is that the *Pueblo* was engaging in espionage activities. One North Korean propaganda technique is to compare a slogan and use it over and over. In the case of the *Pueblo* this has been done again and again. "The armed intelligence ship of the U.S. imperialist aggressor" has become almost a proverb in North Korea. Captain Bucher, in his confession which he reads aloud in the film, says that "we spied on various military installations and the distribution of industries, and the deployment of armed forces . . ." The contents of the letter to the

President, which Bucher also reads aloud, reiterates the espionage mission of the *Pueblo*.

The North Korean insistence that the U.S. apologize for the intrusion and activities is manifested primarily in the open letter to President Johnson. Bucher reads, "Our repatriation will be realized only in the case that the Government of the United States admits, not only the Pueblo's infiltration . . . , but hostile acts, and sincerely apologizes for these acts and gives assurance that they will not be repeated . . ." The letter then gives an emotional call for the crew's quick repatriation.

The fourth content category is that North Korea is treating the crewmen humanely, in spite of the crew's admitted criminal acts. The crew is seen eating breakfast while sitting at Western-style tables and chairs. The crew is shown reading North Korean books printed in English. Recreation is provided for all crew members and officers in the form of cards and physical conditioning exercises. One sequence of pictures illustrates the medical care being afforded the men by their North Korean captor.

The crewmen had rooms which appeared to be individual type rooms. They were furnished with Western-style furniture and beds. It was noted that the rooms appeared ready for a "White-glove" inspection.

[AUDIENCE ANALYSIS]

In audience analysis of the "SCAME" formula, it is found that this film has been shown in a myriad of countries. It must be assumed that the term *audience* takes on a very broad connotation. However, there are at least several common characteristics that can be found in all of the diverse audiences. For one thing, the film is, say the North Koreans, shown at embassies or official functions. The other is that all of the countries have some level of relations with North Korea. This might well predispose viewers to be more receptive to anti-U.S. propaganda.

There is also the possibility that there is more than one intended audience. It is obvious that the countries where this film is shown are the apparent audience group. However, it would appear that North Korea hopes to influence other world people who are either neutral or even pro-U.S. at this time. Japan, for instance, has no official relations with North Korea. Such areas may, in fact, be North Korea's ultimate audience. One thing not yet mentioned is the possibility that this film may be targeted for the U.S. The effect may be fairly great even though the U.S. does not see the film. This may seem incongruous at first glance, but this still may be the case. If North Korea could add to internal dissension in the U.S. by sowing doubts as to whether the *Pueblo* was in international waters, there is little doubt that North Korea would do so. Yet, how could this benefit North Korea? Two ways, one direct, one indirect. First, if doubts were implanted in the minds of Americans concerning U.S. military involvement in Korea, there might be a "pull-out of South Korea movement" similar to the case with Vietnam now.

President, which Bucher also reads aloud, reiterates the espionage mission of the *Pueblo*.

The North Korean insistence that the U.S. apologize for the intrusion and activities is manifested primarily in the open letter to President Johnson. Bucher reads, "Our repatriation will be realized only in the case that the Government of the United States admits, not only the *Pueblo*'s infiltration . . . , but hostile acts, and sincerely apologizes for these acts and gives assurance that they will not be repeated . . ." The letter then gives an emotional call for the crew's quick repatriation.

The fourth content category is that North Korea is treating the crewmen humanely, in spite of the crew's admitted criminal acts. The crew is seen eating breakfast while sitting at Western-style tables and chairs. The crew is shown reading North Korean books printed in English. Recreation is provided for all crew members and officers in the form of cards and physical conditioning exercises. One sequence of pictures illustrates the medical care being afforded the men by their North Korean captor.

The crewmen had rooms which appeared to be individual type rooms. They were furnished with Western-style furniture and beds. It was noted that the rooms appeared ready for a "White-glove" inspection.

[AUDIENCE ANALYSIS]

In audience analysis of the "SCAME" formula, it is found that this film has been shown in a myriad of countries. It must be assumed that the term *audience* takes on a very broad connotation. However, there are at least several common characteristics that can be found in all of the diverse audiences. For one thing, the film is, say the North Koreans, shown at embassies or official functions. The other is that all of the countries have some level of relations with North Korea. This might well predispose viewers to be more receptive to anti-U.S. propaganda.

There is also the possibility that there is more than one intended audience. It is obvious that the countries where this film is shown are the apparent audience group. However, it would appear that North Korea hopes to influence other world people who are either neutral or even pro-U.S. at this time. Japan, for instance, has no official relations with North Korea. Such areas may, in fact, be North Korea's ultimate audience. One thing not yet mentioned is the possibility that this film may be targeted for the U.S. The effect may be fairly great even though the U.S. does not see the film. This may seem incongruous at first glance, but this still may be the case. If North Korea could add to internal dissension in the U.S. by sowing doubts as to whether the *Pueblo* was in international waters, there is little doubt that North Korea would do so. Yet, how could this benefit North Korea? Two ways, one direct, one indirect. First, if doubts were implanted in the minds of Americans concerning U.S. military involvement in Korea, there might be a "pull-out of South Korea movement" similar to the case with Vietnam now.

ments is very seldom used in the Western world. For instance, the North Korean Government insists on being called the Democratic People's Republic of Korea (DPRK), and, as can be seen in the movie script, this phrase is used at least seven times by Bucher and Murphy, the ship's navigator. It is obvious that some North Korean "guidance" had to be given to these two men, since the North Korean Government will not allow itself to be referred to as anything but the DPRK. Western nations do not usually use DPRK.

A final incongruity involves the crew's living quarters. The quarters were unquestionably adequate, almost plush. However, one might question the fact that the rooms appeared "white-glove" inspection-ready. It is to be expected that the men would have to keep their rooms straight, for morale purposes, if nothing else. However, the fact that nothing was out of place makes one wonder if these quarters are really used by the crew.

In conclusion, it is obvious that the North Koreans have used the *Pueblo* incident to great benefit. The film "*Pueblo*, Armed Spy Ship of the U.S. Imperialist Aggressors," is "good" propaganda, at least as far as North Koreans are concerned.

[The analysis is followed by a translated script of the film.]

SOURCE ANALYSIS

Analysis of the source of a communication focuses on the relationship of the source and the audience and often involves the question of "credibility." In other words, although source prestige and other variables may be relevant considerations in the analysis, they are insufficient without data on the audience attitudes by which those variables may be affected or which they may affect. Most of the conclusions regarding attributes of the source that may be important in determining his credibility are tentative: research findings of scientists in the communications field seem to conflict. Richard H. Orth, in the first of two essays in this section that deal with source attributes and audience credibility, discusses some of the more important conclusions research has indicated. A contribution by R. Barry Fulton describes one method used to measure credibility. Radio Free Europe's (RFE's) sampling techniques also illustrate a means to measure the relationship of the audience to persuasive appeals from various countries.

Source analysis need not focus solely on the audience-source relationship, although this is usually the subject on which it seeks to shed light. Study of the role of the communicator may also involve its relationship to a political hierarchy or its philosophies, attitudes, or operational methods. Valyuzenich's polemical description of the American organization for, and approach to, international political communications is an example of such analysis.

The concluding essay in this section provides an additional example of

how the evaluation of the communicator's objectives and technique can contribute to nonhostile source analysis.

SOURCE FACTORS IN PERSUASION*

BY RICHARD H. ORTH

In developing a persuasive appeal, PSYOP planners must carefully consider the attributes of the source as a significant desideratum is receptivity to the message.

In their classic summary of source effect, Hovland, Janis, and Kelley suggest that the term "source" can subsume under it more specific elements of the communications process such as the originator and channel.¹ They further state that most probably the same basic factors that apply to persons will apply to other elements such as the medium used. For the purposes of this essay, the distinction among the various types of sources has little importance. The main principle is that the nature of the source ought to be considered before a campaign is initiated.

Hovland, Janis, and Kelley mention only some basic considerations:² Communicator credibility and trustworthiness and the duration of the effects brought about by the credibility and/or trustworthiness of the communicator. Most of the results of their work have become a standard caveat among individuals involved in both the basic and applied fields of attitude change. However, further inroads have been made by looking into the concept of credibility in more detail.

CHARACTERISTICS OF THE SOURCE: SIMILARITY

There should be some basis for similarity of interest between the source of the message and the target. Moreover, the similarity should occur in an area relevant to the issue. One issue that has come to the fore concerns the similarity of the source and the receiver. It appears that when the two enjoy some area of shared characteristics, the source has more success in persuading the target. Before accepting such a statement, one must examine more closely how similarity affects persuasiveness. For example, Mills and Jellison found that if the sender has an occupation similar to that of the target, he is more persuasive.³ Interestingly enough, the similarity in occupation did not increase persuasiveness by making the source seem more credible. Rather, the increased persuasiveness derived from the medium of shared experiences. A study by Berscheid found that a similarity in values helped boost the effectiveness of the source.⁴ Moreover, Berscheid showed that similarity of values is more important if that similarity occurs in an area relevant to the issue on which the persuasion is being attempted.⁵

In a further investigation of the similarity issue, Brock showed that fine discriminations were made by the receiver,⁶ thus suggesting that the

*Original essay by Richard H. Orth.

closer the source and the receiver are, the better the chance of influencing the receiver.

It should be noted for practical application of such research that the similarity that is being discussed is specifically concerned with the values held by the source and the receiver. Thus, the psyoperator must be very careful if he chooses to base a campaign on the similarity between a source and a target. For example, it may seem intuitively correct to use a defector as the source of a message urging surrender. However, a question that must be asked is: "Do this source and the proposed target hold similar values regarding surrender?" The evidence, by the fact that the source defected while the target did not, suggests that they have different values about surrendering to an enemy force. As shown below, this fact need not, by itself, rule defectors out as sources in PSYOP campaigns. However, their use must be carefully weighed in terms of the potential benefit and potential harm to the campaign from the receiver's evaluations.

INTENT

The source's intentions are important to the success of a persuasion campaign. If the intent to persuade is obvious, the PSYOP communicator can circumvent the suspicion of an audience by presenting the message in a particular framework that can override the obvious intent.

Another characteristic of the source that has received some attention since the original concerns expressed by Hovland, Janis, and Kelley is the intent of the communicator.⁷ The question here is whether a communication that is an avowed attempt to persuade is more successful than one in which the objective (persuasion) is hidden. Intent could be examined in more general terms, but most frequently it concerns an individual's assessment of what the source is attempting to accomplish by engaging in the communication process. One need only consider his own behavior when reading or watching television. An advertisement or political statement is interpreted by the audience as an attempt to persuade. Of course, if the receiver's attitude is already in line with the message, the judgment may be (and usually is) different. There is little chance that the receiver will assess the source as one who is trying to convince him to change his attitude. However, if the source advocates a position different from that of the receiver, the latter will accuse the source of trying to sway his feelings. Usually when this occurs, very little opinion change takes place. There is evidence for this phenomenon. For example, it has been shown that a communicator is more effective when he is overheard than when he confronts the receiver.⁸ Another study showed that taking a receiver's mind off the fact that a persuasion attempt is being made resulted in greater attitude change than allowing him to concentrate on the persuasion.⁹ Interestingly enough, this was found to be true only when there was strong reason to feel that the receivers were involved in the issue over which the change was advocated. This latter point further

supports the contention that intent becomes a factor only when there is a change advocated by the source.

Perhaps the most significant aspect of the intent issue for the psyoperator is that the receiver will surely attribute intent to persuade to any effort directed at him from an enemy force. Thus, the psyoperator must keep in mind that his efforts to persuade the enemy soldiers begin with a major handicap.

One effective technique to overcome this handicap is to convince the receiver that the intent to convince him is undertaken because the source actually likes the receiver.¹⁰ In other words, a receiver who thinks that the source likes him even though he is trying to persuade him to alter his opinion will be more likely to change. Intuitively, this makes sense. The receiver would have to ask why someone who likes him would want him to change his opinion. There are only two responses to the question. On one hand, the source might not know what he talking about. On the other hand, if the source does know what he is talking about, he must be thinking about the best interests of the receiver. This thought process demonstrates that one must be wary of simply using a source who is known to be friendly to the target; he must also be considered to have some expertise on the issue of the attempted persuasion.

DISCREPANCY

The discrepancy between the source and the receiver should be at a level where there can be some basis for mutuality. The primary question concerning discrepancy involves the relationship of the amount of difference between the source and the receiver to the degree of receiver attitude change. Generally, the greatest amount of change will take place at the intermediate level of discrepancy. Figure 1 demonstrates this relationship graphically. It should be obvious that if there is no discrepancy, there can be no change. Moreover, as the amount of discrepancy increases, so does the amount of change. This is true only up to a point: Thereafter, the amount of change begins to decrease as the discrepancy becomes even larger.

Figure 1

This is a very familiar process, exemplified in bargaining situations. In such a case, the buyer meets the price asked up to a point. Past that point, he begins to bargain with the seller to see if they can reach a mutually satisfactory price. In this context, the more the seller sees that his price is beyond the buyer's reach, the more he will tend to lower his price. In essence, the roles of source and receiver keep reversing until agreement is reached. However, if the price that the two parties have in mind is the same, there will be no bargaining. Similarly, if the prices are too far apart there is little chance that bargaining will occur. If either the buyer or seller perceives that the latter is true, there will be little hope of reaching agreement.

Thus, it behooves the psyoperator to insure that the source he uses is seen as being within the scope (usually referred to as the "latitude of acceptance") of the receiver. Unlike the bargaining situation, there is little chance that the source can move toward the receiver in his attitude. In other words, change on the part of the receiver will usually be a major change.

Yet, it might be worthwhile for a PSYOP campaign to try the bargaining approach. However, it has been shown that when there is a great deal of difference between the source and the receiver, the receiver will attempt to derogate the source. That is, rather than trying to think up counterarguments, the receiver will reject the source as being either noncredible or unknowledgeable. If this is true, then a change in the extremity of the source's position may give credence to the receiver's earlier judgment. This would then make the receiver even more likely to reject the qualification of the source.

CREDIBILITY

The source must be credible to the receiver. Credibility has traditionally been discussed in terms of trustworthiness and expertise. For example, a source that is shown to be trustworthy is more credible than one that is shown to be untrustworthy. However, trustworthiness is an attribute of the source that is attributed by the receiver. Thus, a Communist newspaper may be seen as untrustworthy by non-Communists but as trustworthy by Communists; the obverse might be true of a non-Communist newspaper. The psyoperator must be aware of this phenomenon. It may operate even more subtly: A source considered trustworthy by a particular receiver in one situation may not be considered so in another situation. For example, an enemy officer may be a highly trusted source for his men about the course of a war when he is their commander. However, should this same officer defect, his comments on the course of the war may easily be dismissed because of his defection. Thus, it is not only necessary for the psyoperator to keep in mind the problem of how trustworthy the source is, but he also must be aware of the limitations of trustworthiness. Moreover, he must analyze the trustworthiness of a source—not from his own perspective, but from the view of the receiver

of the message. Trustworthiness is attributed to the source by the receiver based on his analysis of a multitude of characteristics either actually possessed or assumed to be possessed by the source.

EXPERTISE

The source must exhibit some expertise in the field he is discussing. Another area of credibility that we have ignored thus far is that of expertise. It is common sense that one is much more likely to follow the advice of an expert than that of a novice. The expertise requirement has received ample treatment elsewhere, and there is little need to dwell on it. The psyoperator must utilize a source that is knowledgeable on the issue on which persuasion is attempted. Although demonstrated expertise in a related area may enhance the source somewhat, it is preferable that his expertise be precisely in the issue being discussed.

THE SOURCE AND THE MESSAGE

Especially in PSYWAR situations, it is from the message that the receiver infers the credibility of the source. We have thus far concerned ourselves primarily with characteristics of the source. These characteristics are either possessed by him or they are attributed to him by the receiver. In this context, the question arises: "How does the receiver attribute the characteristics to the source?" Oftentimes, the attribution originates simply in observation. For example, racial or ethnic similarity is often visible to the receiver. Other characteristics can be attributed to the source by knowledge of the position he holds. For example, expertise can be attributed to a college instructor because he is a teacher and, therefore, different from someone who speaks in a social situation.

In a practical sense, however, such clear-cut situations are not often available to the psyoperator. Messages are conveyed in such a manner that the source is usually not clearly identified. This does not mean that the receiver will not attend to the source of the message but rather that he determines on a subjective basis who the source is. One device that is available to the receiver is the message. He may reasonably ask "Who would want to say this to me?" or "Who would want me to perform the acts suggested in the message?" For example, a leaflet suggesting surrender to soldiers of the enemy forces will obviously be attributed to the forces suggesting the surrender. He will then compare the reasons given for the need to surrender with what he knows to exist. On the basis of this comparison, he will make a judgment about the credibility of the source (It must be noted that the credibility attributed to the source from this single comparison is likely to persist for some time, especially if it is negative. This should not be confused with the dissociation of source from content which also operates over time).

Earlier in this discussion the effect of the similarity between the source and the receiver was discussed, and the discrepancy between the stand of the source and the stand of the receiver was examined. The similarity can

be attributed by a variety of means, including observation. The discrepancy, on the other hand, is attributed usually on the basis of the message from the source to the receiver. What happens when the receiver sees the source as being similar to himself, and then when the message is received, he sees a large discrepancy between himself and the source? He has two alternatives available. First, he could determine that the source has more knowledge than he does and will thus change his attitudes. The latter could be done with the least psychological cost. The receiver could think that the source was forced into saying something he did not really believe because he was forced to do so by someone with control over the fate of the source. In a situation where the source is being held by the enemy forces, this has a great deal of credence, as in the case of a captured comrade. The psyoperator must be aware of the latter possibility even when the campaign is aimed at friendly or neutral people. However, in this situation he can increase the psychological cost of the second alternative by loading the source with credibility that would be difficult to discredit.

Another area where the message can affect the rating of the source is in the nature of the language used. If the message is difficult to understand (too complex) or is stylistically incongruent with the source, the receiver is likely to question the quality of the source. For example, if the source is presented as being similar to the receiver and uses a language style that is very dissimilar from that used by the receiver, the intended similarity will quite likely be ineffective, the whole result being a futile PSYOP appeal.

CONCLUSION

In conclusion, it is clear that the characteristics of the source are important to the potential effectiveness of a PSYOP appeal. We discussed some characteristics other than the usual trustworthiness and expertise factors. We do not minimize the importance of these two characteristics, but we must recognize that the source characteristics important to successful PSYOP appeals are many and that all are important. Moreover, the psyoperator must be careful not to isolate source characteristics as being the only relevant factors. Quite often all the care taken to insure a good source can be lost by selecting a message that results in the receiver's derogating the source. The qualities of the source and the content of the message must be congruent if any attitude change is to result.

THE LIKABILITY AND SELF-INTEREST OF THE SOURCE IN ATTITUDE CHANGE*

BY VERNON A. STONE

AND

HARROGADDE S. ESWARA

Evidence provided reveals that it is not always safe to assume that a likable source will be more effective than an unlikable source, and that self-interest (as reflected by occupation) interacts with other source variables rather than manifesting itself as a main effect.

Recent studies have shown that the most favorable source is not always the most effective agent of persuasion. Bauer has found that enduring attitude change in the face of counterpropaganda may be better wrought in some cases by a source of questionable trustworthiness than by a high-trust source.¹ Also in contradiction to common sense notions, Walster, Aronson and Abrahams have found that in some cases a low prestige source may be more persuasive than a high prestige communicator.²

The latter finding came in a test of the hypothesis that "regardless of his prestige, a communicator will gain in effectiveness when he advocates a position opposed to his own best interests and will lose effectiveness when he advocates a selfish position."³ To test this hypothesis, the Walster group used a prosecutor as the high prestige source and a criminal as the low prestige source. The topic was court power—whether there should be more of it, which would presumably be in the best interest of the prosecutor, or less court power, in the best interest of the criminal. There were four conditions, each source taking each side of the argument. As predicted, the criminal was more effective in changing attitudes when he argued against his best interest. But contrary to expectations, the prosecutor was almost equally effective whichever way he argued. This indicated an interaction between prestige and self-interest whereby the

*From "The Likability and Self-Interest of the Source in Attitude Change," *Journalism Quarterly*, XLVI, No. 1 (Spring 1969), pp. 61-68. Reprinted with the permission of *Journalism Quarterly*, copyright holder.

low prestige source gained in effectiveness by arguing against his own best interests, but made no difference for the high prestige source.

Walster and her associates did not accept the interaction interpretation, however. They held the results might have been in part an artifact of the high school student subjects' being more familiar with arguments for strong courts than with arguments against them. They conducted a second experiment in which the sources were a prosecutor and a criminal from the supposedly less familiar Portuguese court system. In this experiment, as predicted, each source was more effective when he argued against his self-interest. Support was claimed for the hypothesis that such will be the case regardless of prestige.

A test of that hypothesis would demand that there indeed be differences in the perceived prestige of the sources. In the first experiment by the Walster group, the prosecutor was clearly rated higher than the criminal on prestige. But in the second experiment, with the setting shifted to Portugal, the criminal was rated almost as high as the prosecutor. It appeared possible that prestige differences might have interacted with self-interest in the first experiment but were too small to do so in the second.

The present study was addressed to the conflicting questions posed by the two earlier experiments: Does arguing against his best interest enhance the persuasiveness of a communicator, regardless of his prestige? Or does such enhancement come only for low prestige sources?

The approach taken here differed from that of Walster and her associates in three basic ways. First, to rule out the possibility of differential effectiveness of messages arguing for and against an issue, the same message was used in all conditions. Second, occupation was used for the manipulation of self-interest rather than of prestige; the manipulation of positive and negative source characteristics was undertaken independently of occupation. Third, in ascribing the source characteristics constituting global prestige, credibility and personal likability were manipulated separately.

The latter strategy was intended to provide a test of the relative effects of credibility and likability on attitude change. The source characteristics of expertness, honesty and influence which constituted the prestige index used by the Walster group may be seen as essentially components of credibility in that they deal with the credentials of the source in relation to the message. But Aronson and Golden have demonstrated that opinion change may be influenced by characteristics of the source which are more or less irrelevant to his credentials.⁴ Moreover, Rarick has separated "cognitive" and "affective" components of source prestige and found both to be positively related to attitude change.⁵

Credibility, in turn, may be considered in terms of such components as expertness and trustworthiness. Although probably closely related in most cases, they do not necessarily have to be. One can conceive of a source which is considered highly expert but untrustworthy and another

which is trustworthy but inept. The credibility component chosen for manipulation in the present investigation was professional expertness.

Likability was treated as including only those characteristics which generally are considered to make a person personally likable but are not necessarily related to his expertness in a profession or an area of knowledge.

Predictions were made for expertness rather than likability because expertness was considered closer to the global prestige variable used in the study suggesting the present one. The main objective was a test of the opposing predictions suggested by data from the study by Walster and associates. The prediction derived from their hypothesis was for a main effect of self-interest whereby a source arguing for such self-interest would be more persuasive than a source arguing for such self-interest, regardless of expertness. The opposing prediction, suggested by the first experiment by the Walster group, was for an interaction whereby an inept source would be more effective when arguing against than when arguing for his best interests, but an expert source would be equally effective whichever way he argued.

METHOD

Subjects were 95 male and 73 female students enrolled in an undergraduate radio-television course at the University of Wisconsin. The experiment was conducted by the senior author during a regular class period.

Subjects were randomly assigned to the eight experimental conditions in a 2x2x2 factorial design. The manipulated variables were (1) the self-interest (occupation), (2) the expertness and (3) the likability of the source. The main dependent variable in the before-after design was attitude change on the issue of courtroom television.

All materials were contained in a single mimeographed booklet titled "Free Press-Fair Trial Study."⁶ Booklets for the eight conditions were identical except for the page describing the source.

The attitude change message was represented to the subjects as one of the responses in a nationwide survey requesting opinions on the issue of television in the courtroom from a random sample of lawyers and newsmen. The message, a 36-line argument against courtroom television, was constructed largely of excerpts from the United States Supreme Court decision of 1965 in the *Billie Sol Estes* case.

To point up the self-interest differences of the occupational variable, the booklet's introduction explicitly noted that television journalists generally consider it against their best interest to have their cameras banned from courtrooms and that criminal lawyers generally favor such a ban on grounds that the presence of television cameras may interfere with a fair trial for their clients. It was also noted that the news media and the bar have collided on the issue many times in recent years.

The source was introduced as JRB, a respondent in the nationwide

survey. At the start of a two-paragraph description, he was further introduced as either (1) a television journalist or (2) a lawyer specializing in criminal cases.

Expertness was manipulated in the first paragraph by describing the source as either (1) a successful practitioner in his profession who had received high recognition from his colleagues or (2) an unsuccessful practitioner who had been described by colleagues as "lacking in sound judgement and professional competence." Thus professional prestige was used as an indicator of expertness.

Likability was manipulated in the second paragraph of the source description by noting that "people who know JRB on a day-to-day basis" describe him as either (1) pleasant, unpretentious, sensitive to the feelings of others, etc., or (2) unpleasant, pretentious, insensitive, etc., characteristics which would tend to make a person unlikable though he might be a highly respected expert in his profession.

No explicit information was provided regarding the source's trustworthiness. Any perceptions of trustworthiness were left to be inferred from the descriptions of the professional expertness and personal likability of the communicator.

All attitudes were assessed on bipolar 7-point scales before and after the attitude change message was read. Attitude toward the issue was assessed by four agree-disagree items expressing the issue of television and free press-fair trial in slightly different ways. The source was evaluated on six dimensions: (1) his reliability as a source of information on the issue at hand, (2) expertness on the issue, (3) bias, (4) trustworthiness, (5) likability as a person and (6) general attractiveness. The message was evaluated by (1) how well made and (2) how sincere were the arguments.⁷

RESULTS

Source Evaluation Factors. A factor analysis of correlations between source evaluation items yielded two factors (Table 1). Reliability and expertness loaded high on the first factor; scores on those two items were summed for the expertness used in the study. Likability and attractiveness evaluations loaded high on the second factor and were summed for likability scores. Because the loadings for trustworthiness and bias were distributed equally between the two factors at the start of the experiment, those characteristics were treated separately.

Manipulation Checks. The pre-message ratings in Table 2 show that the source manipulations yielded the intended high-low distinctions both in the expertness and likability conditions. The midpoint of each evaluation continuum was 8. The mean initial expertness rating given sources in high expert conditions was 9.48 and in low expert conditions 5.79. The difference between likability ratings in the likability conditions was even greater—a mean of 10.21 for subjects who read the high likability source description as against 4.74 for those reading the low likability description.

Arguments sincere ^A				
Journalist	5.93	5.55	5.83	5.64
Lawyer	6.00	5.07	5.81	5.26

^A Scores are by 7-point scales. N = 42 per mean.

There was a fairly high correlation (.41) between the effects of the separate expertness and likability manipulations. Table 2 shows that likability as well as expertness was higher in the high than in the low expert conditions. Similarly, perceived expertness was higher in the high likability conditions. Ratings on trustworthiness and lack of bias were also higher when the source had been described as either expert or likable.

An unexpected result was some initial confounding of occupation with the other source variables. The lawyer was initially rated higher than the journalist on both expertness ($F = 7.68$, $df = 1/160$, $p < .01$) and likability ($F = 9.51$, $df = 1/60$, $p < .01$). Occupational differences in ratings on trustworthiness and lack of bias, while not significant, were also initially in the direction favoring the lawyer. One possible explanation is that the issue involved was essentially a legal one and thus a lawyer might be expected to be better qualified on it. An alternative explanation is that the subjects may have perceived criminal law as a more prestigious profession than television journalism.

Message Evaluation. Table 3 shows that, regardless of what the subjects thought of the source initially, they perceived his message as highly expert. The mean rating given the arguments of the attitude change message on the "how well made" criterion was 6.09 on a 7-point scale. The sincerity of the arguments was also rated highly, the over-all mean being 5.65. Although there were some variations by conditions, the mean message ratings were all high.

Source Evaluation Change. A comparison of pre- and post-message evaluations in Table 2 shows that the message, which was the only variable intervening between the two ratings of the source, substantially changed perceptions of the communicator. Ratings of his expertness and, to a lesser extent, his likability went up in almost every cell following the highly rated message. Both for expertness and likability, evaluations of initially low-rated sources changed more than those for sources rated high initially.⁸

One effect of these changes was the elimination of any significant over-all differences between the journalist and the lawyer on expertness ($F = 1.95$, $df = 1/160$, n.s.) and likability ($F < 1$) ratings. Occupation was intended to serve only as the manipulation of self-interest and not to be confounded with the other source variables. The data indicate that no such confounding existed at the time attitude change was recorded.

However, another effect of the source evaluation changes proved adverse from the standpoint of testing the main prediction. The highly rated message also eliminated the high-low expertness distinction initially achieved by the source descriptions. When his message had been read, the source was perceived on the expert (> 8) side of the continuum both by subjects in the expert condition ($M = 10.68$) and by those in the intended inexpert condition ($M = 9.26$). Thus, as in the second experi-

ment by Walster and his associates, differences in perceived professional expertness or prestige of the source were quite small.

Table 2 shows that the source likability distinction remained following the message, though the high-low gap was reduced considerably. The intended unlikable source remained slightly on the unlikable side ($M = 7.61$) and the intended likable source was clearly on the likable side ($M = 10.48$) of the continuum.

The message, then, can be seen as having a more pronounced effect on the content-directed (cognitive) source variable of expertness than on the purely source-directed (affective) variable of likability. The message also appears to have reduced the overlap between the cognitive and affective evaluations. The correlation between likability and expertness dropped from an initial .41 to a post-message .28. Furthermore, as Table 1 shows, the message changed the source evaluation factor structure. The content-related traits of trustworthiness and bias, which had loaded equally on both factors initially, moved clearly to the credibility factor following the message.

Attitude Change. The existing beliefs of the majority of the subjects were congruent with the position taken in the attitude change. Seventy percent were on the low (anti-television) side of the midpoint of 16 on the against-for continuum. The mean initial attitude level was 13.06 and the median was 12.54.

The four items assessing attitude toward the issue of courtroom television were summed, and attitude change was calculated by subtracting total attitude following the message from total initial attitude.

An analysis of variance (Table 4) failed to yield the main effect of self-interest which the Walster group's hypothesis would have predicted.⁹ The analysis also failed to yield the interaction between self-interest and expertness predicted under the alternative hypothesis that arguing against his best interest will enhance persuasiveness for an inexpert source but not for an expert source. The fact that sources in both expertness conditions were rated expert at the time attitude change was recorded can be seen as militating against differences due to expertness.

Self-interest interacted with likability, and the direction of the interaction was the one predicted for expertness. The means in Table 4 show that the low likable source arguing against his self-interest was more effective than the low likable source arguing for his self-interest. In the high likability condition, on the other hand, the communicator arguing for his self-interest (the lawyer) was as effective as the one arguing against his self-interest (the journalist). Furthermore, using identical arguments, the low likable journalist was more effective than the high likable journalist.

DISCUSSION

The evidence indicates that self-interest—at least the kind reflected by occupation—interacts with other source variables rather than manifest-

ing itself as a main effect. Although the interaction between self-interest and likability was not the one for which predictions were made, the pattern was the same as had been predicted between self-interest and expertness. The unlikable source enhanced his effectiveness by arguing against his best interests, but such was not the case for the likable source. As for the predicted interaction involving expertness, it probably was not given an adequate test in this experiment because the expert-inexpert distinction initially achieved was not retained through the crucial period of a attitude change.

How far this evidence can be generalized depends upon the extent to which the intended variables were indeed manipulated. Checks of the expertness and likability manipulations showed that they produced the desired perceptions of those variables. But were the differences produced by occupations primarily due to perceptions of self-interest? Or did other variables associated with the occupations contribute substantially to the interaction with likability? Had the sources been union and industry officials and the issue open-shop legislation, for example, would the results have been the same? In view of the explicit information given in the test booklets and the fact that the subjects were students midway through a radio-television course, it appears most unlikely that they could have failed to associate the appropriate professional self-interest in the issue of courtroom television with the occupations of lawyer and TV journalist. Whether other occupational connotations acted as variables confounded with professional self-interest is unknown. This is a hazard of using occupations as indicators of self-interest.

Be that as it may, the attitude change interaction is clear evidence that it is not always safe to make the common sense assumption that a likable

source will be more effective than an unlikable source. If the choice is between personally likable and unlikable sources who are willing to argue against their professional self-interest, the evidence here recommends the unlikable one. This further bolsters the notion forwarded by Walster and her associates that in some cases a low prestige source may be even more effective than a high prestige communicator.¹⁰

Why should this be the case? Why should the unlikable journalist, rated lowest of all sources initially, tend to be more effective than any other source in the experiment? A search for correlates revealed that, although the attitude change message was the same for all sources, the arguments tended to be rated best made (Table 3) when they came from the unlikable journalist. The 6.38 rating given his arguments is significantly different ($p < .05$ by 2-tailed t test) from the 5.93 rating given the same arguments from the likable journalist. The correlation between attitude change and argument effectiveness ratings was .22 ($p < .05$). Should this appear to belabor the obvious, it is noted that other variables which might have been expected to correlate with attitude change did not. Evaluations of expertness, bias and trustworthiness of the sources, changes in these evaluations and ratings of argument sincerity yielded no correlations with attitude change. The only other measured source or message variable correlating with attitude change was change in likability ($r = .21$, $p < .05$). Here again, the greatest change was toward the unlikable journalist, initially rated least likable of all sources.

The fact that the message was congruent with existing attitudes of the majority of the subjects was considered as a possible partial explanation of the results. However, this was discounted when an analysis of covariance adjusting for initial attitude levels yielded the same interaction pattern, as did a separate check of the 41 subjects for whom the message was incongruent with initial beliefs, i.e., they favored courtroom television.

Relationships between the various components of source and message evaluation are of interest in their own right. The evidence suggests that it is well to consider the message-related (credibility) and purely source-related (likability) components of source evaluation separately. Although there may be some overlap between credibility and likability, they appear to operate independently enough to warrant separate consideration.

Perhaps the evidence pointing most strongly to a specific area of further research is that which showed the message to have such pronounced effects on source perception. Although such a change in source evaluation is not surprising in view of congruity theory,¹¹ most investigators have studied only the effects of initial credibility and other source variables upon message acceptance and attitude change and have ignored the effects these processes may have upon how the source is perceived. The present study demonstrates that the communicator may be seen quite differently before and after his message is received. Such evidence

argues against the procedure of assessing only initial attitudes toward sources.

Finally, the pre- and post-message factor analyses of source evaluations indicate that when explicit information regarding expertness and likability but not trustworthiness is available, people tend to draw equally upon cues from the other characteristics in estimating trustworthiness. However, a message judged highly expert and sincere can move trustworthiness clearly into the credibility factor. The question of how trustworthiness is related to other variables also warrants further study.

THE HUNGARIAN SELF-IMAGE AND THE HUNGARIAN IMAGE OF AMERICANS AND RUSSIANS*

BY RADIO FREE EUROPE

Findings, in part, indicate, but do not prove conclusively, that stereotypes cannot be changed by a radio station's efforts alone; however, at least to some extent, the young and the better-educated are less given to extreme national stereotyping.

INTRODUCTION

This report investigates the Hungarians' image of themselves and of two other nationalities: the Americans and Russians.

It is part of a research series examining national Auto- and Hetero-Stereotypes in Eastern Europe and follows the study "The Polish Self-Image and the Polish Image of Americans, Russians, Chinese, Germans, and Czechs," published in January 1969.

Like the previous study, this one is based on the Buchanan-Cantril "Adjective Check List."¹ The respondents are handed a list of adjectives and asked to select those that in their opinion apply to their own countrymen. They are then asked to do the same for each of the foreign nationalities.

The Buchanan-Cantril "Adjective Check List" consists of twelve adjectives:

Hard-working	Self-controlled
Intelligent	Peace-loving
Practical	Conceited
Generous	Cruel
Brave	Domineering
Progressive	Backward

For this study the list had to be slightly adjusted: "Self-controlled" was eliminated because pre-test results showed that the interviewees were not sure just what it denotes. "Progressive" was replaced by "Advanced" because of the tendentious connotations of "Progressive" in Communist countries.

The idea underlying the employment of the "Adjective Check List" is based on the observation that people tend to ascribe to their own social or national group a set of characteristics generally different from the character traits they ascribe to other groups or nations. The resulting self-image ("Auto-Stereotype") is predominantly flattering, while their picture of "others" ("Hetero-Stereotype") is strongly influenced by how much they imagine those others to be like themselves.

*Excerpts from "The Hungarian Self-Image and the Hungarian Image of Americans, Russians, Germans, Rumanians, and Chinese," Radio Free Europe, Audience and Public Opinion Research Department, February 1970.

Thus the relative "similarity" or "dissimilarity" between group stereotypes is a useful indicator of the degree of friendliness or dislike between groups or nations.

Extensive research in this field has led to three conclusions:

- (a) Hetero-Stereotypes are seldom based on objective assessments; as a result the tendency to extreme stereotyping reveals the existence of strong emotions between social or national groups.
- (b) Established *social* Hetero-Stereotypes resist change. Even the recognition of individual differences among members of the "other" group rarely affects the Hetero-Stereotypes of the group as a whole ("Some of my best friends are, but").
- (c) *National* Hetero-Stereotypes are sometimes less rigid, especially when formed as the result of specific and extraordinary situations and if they are of recent origin. As Cantril and associates noted, the temporarily positive American Hetero-Stereotype of the Russians deteriorated significantly between the joint-war-effort year of 1942 and the cold-war year of 1948. This sharp change occurred because the Russian actions during the cold-war period were contrary to U.S. policy *and* the American self-image.²

However, long established national Hetero-Stereotypes are as difficult to change as social ones. They are almost immune to change when this is attempted by a government which does not have the support of its nation. It is known that the policy of the Hungarian regime toward most Western nations conflicts with popular sentiment.

The survey findings will be analyzed in two ways:

- (a) All eleven adjectives will be treated as an entity and the *overall* findings for one nation or social subgroup will be compared with the overall findings for another.
- (b) The adjectives will be grouped into and analyzed in the following four categories:
 - (1) Hard-working
Intelligent *Positive Unemotional*
Practical
 - (2) Brave
Peace-loving *Positive Emotional*
Generous
 - (3) Advanced *Level of Development*
Backward
 - (4) Conceited
Domineering *Negative Emotional*
Cruel

The first section of the report compares the Hungarian self-image with the Hungarian image of the other nations in toto. [Other] sections will

treat each nationality in greater detail with special emphasis on how age and educational background affect the attitudes.

SAMPLE AND METHOD

This report is based on a survey of 1,055 Hungarian nationals interviewed . . . by independent opinion research institutes in seven West European countries. The interviewers were not identified with Radio Free Europe.

Most of the respondents were visiting the West as tourists (41%) or as guests of families living in the West (36%). Regime officials and members of regime-sponsored groups accounted for 8%. Fifteen percent were refugees or legal emigrants.

Certain population groups (people with lower educational and occupational attainments and rural residents) were underrepresented in the sample. Other groups (urbanites and the educational and occupational elites) were overrepresented. To bring the sample results into line with the population at large, these disproportions were corrected *ex post facto*: the weights of the underrepresented groups were appropriately increased and those of the overrepresented groups decreased to conform with their distribution in the entire population.

The COMPARATIVE AND CONTINUAL SAMPLING method was applied. This method stipulates that analysis can be undertaken only if *all* findings based on the different and independent samples obtained in the various interviewing areas agree to a significant extent.

* * * * *

I. How the Hungarians Compare Themselves to the Americans and Russians

The respondents were handed the list of eleven adjectives and told:

Here is a list of words by which one can describe people. Please go through this list carefully and select all the words from it which apply to your countrymen.

The process was then repeated *separately* for . . . Americans, Russians, Germans, Rumanians, and Chinese.

Table 1 lists the findings for all six nations:

Table 1

	Hungarian Hetero-Stereotypes of:					
	Hungarian Self-Image %	Americans %	Germans %	Russians %	Rumanians %	Chinese %
Hard-working	69	53	82	23	8	45
Intelligent	74	51	71	13	11	13
Practical	43	71	67	26	18	20
Brave	79	29	57	27	4	17
Peace-loving	67	41	20	28	15	3
Generous	68	63	13	8	4	1
Advanced	49	52	38	17	14	5
Backward	8	1	1	49	61	59
Conceited	23	32	57	44	37	28
Domineering	4	11	30	58	40	44
Cruel	3	6	35	49	46	64

As Table 1 shows, there were side differences in how the Hungarians looked at the five foreign nations.

To assess relative degrees of sympathy or antipathy, the Hungarian Auto-Stereotype was correlated with each of the five Hetero-Stereotypes. The correlation coefficients had a potential range from +1.00 (total identity) to -1.00 (total contrast).

The resultant correlation can be interpreted in terms of the basic theory outlined in the introduction, namely that the degree of similarity or dissimilarity between a national Auto-Stereotype and a national Hetero-Stereotype is indicative of the character of feelings between nations.

Table 2

Hungarian Auto-Stereotype	: American Hetero-Stereotype	= +0.71
Hungarian Auto-Stereotype	: German Hetero-Stereotype	= +0.40
Hungarian Auto-Stereotype	: Russian Hetero-Stereotype	= -0.67
Hungarian Auto-Stereotype	: Chinese Hetero-Stereotype	= -0.76
Hungarian Auto-Stereotype	: Rumanian Hetero-Stereotype	= -0.92

The Hungarian Auto-Stereotype correlates positively only with the American Hetero-Stereotype (+0.71) and, to a lesser degree, with the German (+0.40). In other words, the Hungarians ascribe to the Americans many, and to the Germans some, of the characteristics they ascribe to themselves.

The three other correlation coefficients were negative: the Russians (-0.67), the Chinese (-0.76), and the Rumanians (-0.92); they showed a marked contrast to the Hungarian self-image and thus antipathetic sentiments.

However, a more qualitative analysis of the assessments reveals that the correlation coefficients fail to tell the whole story. Because emotionality is probably the major determinant of stereotyping, an attempt was made to isolate the emotionally charged adjectives in the "Adjective Check List" and consider them separately—i.e., to compare Their prevalence in the Hungarian self-image with their prevalence in the five Hetero-Stereotypes. An average score was computed for the three positive emotional adjectives in the list ("brave," "peace-loving," and "generous"), and the three negative emotional adjectives ("conceited," "domineering," and "cruel").

Graph 1 shows the following results:

The high "positive emotional" score for the Hungarian Atuo-Stereotype indicates that the traditional national virtues of bravery and generosity and also love of peace continue to stir the Hungarians.

Scrutiny of the various Hungarian Hetero-Stereotypes gives the following picture:

- (1) The Hungarians' emotional attitude toward the Americans was the *only* positive one, the ratio between "positive emotional" evaluation and negative being 2.75: 1. In all other Hetero-Stereotypes the

Graph 1.

*Degree of Emotionality in the Hungarian Self-Image
and in the Hungarian Hetero-Stereotype of Five Other Nations.*

negative emotionality exceeded the positive, with variations from nationality to nationality.

- (2) Hungarian sentiments toward the Germans were ambivalent (ratio of positive: negative = 1:1.4), but the degree of emotional involvement was considerable: 71% (positive score = 30; negative score = 41).
- (3) The Hungarian attitude toward the Russians was predominantly negative (ratio positive: negative = 1:2.4), but it was marked by the same high degree of emotional involvement as the German Hetero-Stereotype was, 71% (positive score = 21; negative score = 50).

- (4) The "emotional" Hetero-Stereotypes of both the Rumanians and the Chinese were almost exclusively negative (the ratio positive: negative for the Rumanians being 1:5, for the Chinese 1:6.4). Half the sample revealed emotional involvement in their attitude toward these two nationalities. For the Rumanians 49% (positive score = 8; negative score = 41), for the Chinese 52% (positive score = 7; negative score = 45).

The findings may be interpreted as follows:

The *Americans*, in the eyes of the majority of Hungarians, possess to a relatively high degree two of the character traits that Hungarians consider themselves to possess—"generosity" and "love of peace," but this "positive emotional" image was incomplete: only a minority of Hungarians (29%) attributed to the Americans the most highly regarded virtue in the Hungarian self-image, "bravery." The low "bravery" evaluation is no doubt a heritage from the 1956 Hungarian revolution: many Hungarians still seem to blame the West, especially the U.S., for withholding aid against the Soviets during that crisis. Nevertheless, few Hungarians attributed to the Americans such "negative emotional" characteristics as "conceited" (32%), "domineering" (11%) and "cruel" (6%). In fact, they saw these character traits almost as frequently in themselves.

The Hungarians' emotional attitude toward the *Germans* was ambivalent. On the one hand, the Germans drew the highest rating for "bravery," the most valued trait in the Hungarian self-image; on the other hand, the Germans ranked very low in other assumed positive Hungarian characteristics: "generosity" (13%) and "love of peace" (20%). The high rating for "bravery" must be partially traceable to the Hungarian-German military cooperation in World Wars I and II. Nevertheless, the Germans' relatively high showing for "negative emotional" characteristics—"conceited" (57%), "cruel" (35%) and "domineering" (30%)—indicates an emotionally unfriendly attitude. As will appear later, the relatively positive image that, overall, the Hungarians hold of the Germans is due to "positive unemotional" traits of character.

There is nothing surprising in the Hungarians' strong emotional involvement with the *Russians*, or in the fact that those emotions are predominantly negative. One has only to recall the Soviet occupation of their country during World War II, the establishment of a Soviet-sponsored political system, and the Soviet suppression of the 1956 Hungarian revolution. "Domineering" (58%), "cruel" (49%) and "conceited" (44%) were the Russians' most frequently mentioned "emotional" attitudes.

The Hungarian Hetero-Stereotype of the *Rumanians* reflects the long-standing territorial dispute between the two countries and the problem of the Hungarian minority in Transylvania. The Rumanians were seen as lacking all the traditional character strengths of the Hungarians ("bravery," 17%; "generosity," 1%; "love of peace," 3%), and as possessing such "negative emotional" characteristics as "cruelty" (46%), "domineeringness" (40%) and "conceit" (37%).

Although the *Chinese* are far away and the Hungarians' personal experience with them is nil, this Hetero-Stereotype is predominantly negative. "Cruelty" was the most frequently mentioned character trait—a reflection no doubt of a traditional fear of the "Yellow Peril"—as well as of a repugnance for the political dogmatism and intrasigence of the Chinese leadership, evocative as they are of the worst periods of the Stalinist era.

Graph 2 shows how the Hungarians assessed themselves and the five other nationalities with regard to their "level of development"—i.e., how often they used "advanced" and "backward" to describe their own nation and the others.

The Hungarians' image of their own level of national development, as depicted in Graph 2, reflects the tendency of all social or national groups to flatter themselves. The positive/negative ratio of 6:1 (49% to 8%) is very favorable.

The assessments of the five foreign nations show a clear-cut split: everything west of Hungary was considered highly advanced, everything east backward. The Americans led all other nations, including Hungary, in their assumed level of development. The Germans approximated the Hungarian self-image. The Russians, in spite of their considerable technological achievements, were regarded as being rather backward. Traditional superiority feelings toward the Rumanians colored that image. The Chinese—as the most "Eastern" of the five nationalities—were considered the most backward.

Net scores for the level of advancement for the six nationalities—arrived at by deducting the "backward" scores from the "advanced"—clearly show this split:

Americans	+ 51
Hungarians	+ 41
Germans	+ 37
Russians	- 32
Rumanians	- 47
Chinese	- 54

II. The Hungarian Self-Image

Now we shall submit the Hungarian self-image to closer scrutiny, paying particular attention to differences related to such factors as age and education.

Both the "positive emotional" and the "positive unemotional" groups of adjectives dominated the Hungarian Auto-Stereotype (Graph 3). The attributes that the Hungarians most frequently ascribed to themselves were: "brave" (79%), "intelligent" (74%), "hard-working" (69%), "generous" (68%) and "peace-loving" (67%).

Among the "negative emotional" characteristics, "conceited" was mentioned by 23% of the respondents. This and the fact that less than half the interviewees considered the Hungarians to be "advanced" (49%) and

Graph 2.

“practical” (43%) shows that the Hungarian self-image was not completely uncritical.

Graph 4 shows a remarkable similarity between young and old, in other words a strong consistency in the Hungarian national self-image. In spite of this general consistency, the young Hungarians considered their compatriots less “hard-working,” less “generous” and less “brave” than the older generation did—the skepticism of the youth of today.

Graph 5 compares the Auto-Stereotype of the well-educated Hungarians with that of the less well-educated.

Graph 3.

While age did not significantly affect the Hungarian self-image, education did:

Graph 5 shows that the members of the educational elite viewed their countrymen much more critically than the non-elite did—most significantly in respect to the following attributes: “hard-working” (educational elite = 48%, non-elite = 82%), “brave” (64% to 90%), “practical” (36% to 51%), “advanced” (42% to 54%), “peace-loving” (63% to 72%) and “conceited” (36% to 19%).

Graph 6 shows that in the breakdown by education the *young* Hungarians followed the pattern of the overall sample: The more educated were more self-critical.

III. The Hungarian Image of the Americans

Graph 7 depicts the favorable Hungarian hetero-stereotype of the Ameri-

Graph 4.
The Hungarian Self-Image
(According to Age)

cans which evidently exists in both the emotional and unemotional perceptual areas.

Graph 7 shows that the Hungarians viewed the Americans as “practical” (71%), “generous” (63%), “hard-working” (53%), “advanced” (52%), and “intelligent” (51%)—mostly “positive unemotional” characteristics. However, the high “level of development” assigned to the Americans and the important “positive emotional” attribute “generous,” one of the most treasured traits in the Hungarian self-image, contributed to the favorable overall image.

Moreover, the Americans’ positive image was untarnished by strong “negative emotional” sentiments. Only 32% regarded the Americans as

Graph 5.
The Hungarian Self-Image
(According to Education).

“conceited,” 11% as “domineering,” and 6% as “cruel.” “Conceited” and “domineering” are attributes very likely to be attached to a world power, but they were mentioned by surprisingly few respondents—not so very many more than ascribed them to their own countrymen (“conceited,” 23% “domineering,” 4%). It is noteworthy that in spite of the incessant regime propaganda about American “war crimes” in Vietnam, only six out of one hundred Hungarians considered cruelty part of the American national character.

Graph 8 compares how Hungarians with only a basic education differed from the better-educated in their view of the Americans. Hungarians with a university education considered the Americans significantly more “practical,” “brave,” and “generous” but also more “conceited” than the

Graph 6
The Hungarian Self-Image
(According to Education—
of Those up to 25 Years of Age Only).

non-elite did. Concerning the two “positive emotional” characteristics—“brave” and “generous”—the attitudes toward the West developed during the Hungarian Revolution of 1956 may very well be mainly responsible for the differences: Hungarians with only a basic education probably regard the U.S. inaction during that crisis as having been motivated by cowardice and selfishness, whereas their better-educated compatriots see a less simplified picture.

Graph 9 shows that the young educated showed the same pattern as the older educated. By the same token, young people with lower education held nevertheless the same attitudes as the old lower educated respondents.

Graph 7.

Graph 9 shows that the young educated showed the same pattern as the older educated. By the same token, young people with lower education held nevertheless the same attitudes as the old lower educated respondents.

As Graph 10 shows, the Hungarian Hetero-Stereotype of the Russians is dominated by "negative emotional" sentiments. The Russians were described as "domineering" (58%), "cruel" (49%), "backward" (49%), and "conceited" (44%). Only a tenth to a quarter of the respondents saw "positive emotional" traits in them, suggesting that the majority of Hungarians feel toward the Russians a mixture of cultural superiority and a strong antipathy.

As Graph 11 shows, the older respondents were more negative about the Russians than the younger generation was. The two age groups differed most on emotional characteristics: more young respondents described the Russians as "brave" and "peace-loving." Conversely, the over-40 group tended to regard the Russians as more "cruel" and "domineering."

Graph 8.
The Hungarian Image of the Americans
 (According to Education)

No significant differences in feeling toward the Russians could be elicited from Hungarians of different educational backgrounds.

V. CONCLUSIONS

The Auto-Stereotype and the various Hetero-Stereotypes of RFE listeners and of non-listeners differed only slightly. Where statistically significant differences could be established, it was not the factor of listening or non-listening which produced them but other factors unrelated to Radio Free Europe's impact. The data indicate but do not conclusively prove that stereotypes cannot be changed by a radio station's efforts alone.

Graph 9.
The Hungarian Image of the Americans
(According to Education—
of Those up to 25 Years of Age only).

IV. THE HUNGARIAN IMAGE OF THE RUSSIANS

Graph 10 suggests that most Hungarians have strong negative emotions toward the Russians and feel culturally superior to them.

These findings, like those in the first major APOR study of national stereotypes—"The Polish Self-Image and the Polish Image of Americans, Russians, Chinese, Germans and Czechs," January 1969—reaffirm the basic theory put forth in the Introduction: Established Hetero-Stereotypes resist change, and even the recognition of individual differences among members of the "other" group rarely affects the Hetero-Stereotype as a whole. This report showed, too, that a negative national

Graph 10.

Hetero-Stereotype is especially firmly entrenched when it has been formed by a historical enmity and feeling of cultural superiority, as the Hungarian attitude toward the Rumanians has been.

However, the findings also revealed that, at least to some extent, the young and the better-educated are less given to extreme national stereotyping, although the two concurred in the negative appraisal of the Rumanians.

In this context it was of particular significance to note that no amount of regime indoctrination of the older or the young succeeded in establishing "Socialist Solidarity" or erasing national prejudices. As was stated before, this state of affairs will have to be taken into account in the decision-making processes of leaders East and West.

WAYS AND MEANS OF U.S. IDEOLOGICAL EXPANSION*

BY A. VALYUZHENICH

A current Soviet analysis of the philosophy and organization of U.S. international political communications.

* * * * *

U.S. ideological expansion based on anti-Communism is apparent in new components in foreign policy machinery; as well as in intensification of the propaganda functions of U.S. government bodies. An important role is also assigned to various private and semi-official organisations, charity funds, educational and cultural institutions. The ways and means of U.S. ideological expansion are most clearly manifest in the activities of the three main centres of American foreign propaganda—the United States Information Agency (USIA), the Pentagon and the State Department.

The president of the U.S. has charged the USIA with the mission of elaborating and implementing foreign policy propaganda programmes and actions; it coordinates the propaganda of all other U.S. government bodies with the exception of the Pentagon and CIA and works closely with the propaganda services of other imperialist states, Great Britain and the Federal Republic of Germany in particular. The basic documents of the USIA, founded in 1953, naturally contain no references to “psychological warfare” or propaganda in general. These words are replaced by the more neutral and flexible word “information.” Thus, U.S. legislators sought, as much as possible, to dissociate themselves from the “psychological warfare” methods which had been compromised back in the Truman presidency. They also tried to gloss over the class meaning of their propaganda and persuade other nations that the United States furnishes unbiased information, particularly emphasising the USIA’s chief aim of telling “the American story to the World”.

According to Perusse, a former long-standing USIA propagandist, “the entire task of dealing with foreign people will be made easier” if the corresponding services of the United States will “go along with a tide of public opinion at home and abroad and drop the word [propaganda] completely. . .” Perusse made it clear that from a strictly professional viewpoint, “this is ‘psychological warfare’, pure and simple, as everyone who has engaged in any aspect of such activity will recognise”.¹

That USIA propaganda has long been called “overseas information”, “international communication” and “international information” demonstrates that such recommendations of the “psychological operations” experts have won approval. Only under the Kennedy Administration was USIA activity overtly called propaganda. The USIA participation in the

*Excerpts from “Ways and Means of U.S. Ideological Expansion,” *International Affairs* (Moscow), No. 2, February 1971, pp. 63–68.

“psychological operations” carried out by the U.S. military in Vietnam has generally revealed the shameful role of the USIA in fabricating and putting about all kinds of slander to whitewash the criminal U.S. aggression in Indochina.

In preparing news and comment for the Voice of America radio station, TV broadcasts, films, displays, magazines, booklets and other publications, the USIA propagandists pursue the same objectives that are dictated by U.S. military-political strategy aimed at interfering in the domestic affairs of sovereign states. Lecturers, teachers and tourists going abroad receive similar instructions in propaganda.

Blatant propaganda moves which may clearly compromise the U.S. Administration in the eyes of the world are frequently carried on not by USIA but by organisations and centres with private signboards such as “Radio Liberty” or “Radio Free Europe”. The CIA, which maintains close contacts with the USIA, is charged with carrying out the most important ideological subversion.

* * * * *

Everday news released by the USIA and other American propaganda services is called “managed news”. Miles Johnson, a journalist writing on international affairs and familiar with “the management of news,” wrote that it implied “all of the means, direct and indirect, the government employs to manufacture, control, manipulate, and shape the news relating to its activities so as to affect opinion, either at home or abroad, in a manner advantageous to itself”.²

Two Washington journalists exposed the alleged objectivity of the U.S. ruling circles’ “information policy,” when they wrote of U.S. foreign policy in the 1960s: “Repeatedly the government of the United States has been caught in the act of telling lies to its citizens and to the world. Not euphemisms or exaggerations, not the deft distortions and slick simplifications that constitute the fine art of propaganda, but deliberate and flagrant lies. Three successive national administrations have made the device of outright deception their method of choice in dealing with foreign affairs crises.”³

U.S. propaganda today frequently employs the “soft sell” method. U.S. ideologists had used “hard sell” at the height of the cold war when the overtly aggressive strategies of “containment”, “rolling back”, and “liberating” were proclaimed.

The “soft sell” has many versions, but all of them have been most often used in ideological subversion against the socialist community gradually to erode and undermine the foundations of socialism. In other words, they are part of the notorious “bridge-building” strategy.

The manner of U.S. propaganda against socialist countries has changed correspondingly. In the past, it was primarily meant for socialism’s opponents, the remnants of the exploiting classes and people who felt “socially depressed”; these sections of the population were supposed to undermine

the system from within. U.S. propaganda is now, however, making a play for other sections of the population brought up under socialism; it is counting on a long-term process of "transformation" of socialism. The propagandists have particularly been keen to extol the scientific and technological achievement of capitalist countries expecting them to cause disillusion with socialism thereby impelling the sections towards "integration" with Western countries, and breaking up the socialist community.

To make their material and broadcasts convincing, U.S. propagandists assume an attitude of defending "true socialist ideals" by condemning all adherents of "conservatism", "sectarianism," "dogmatism" and other "isms" they themselves have invented. Imperialist propaganda has always attached major importance to whipping up nationalism and chauvinism, counterposing them to socialist proletarian internationalism.

USIA activity is based on the strategy and tactics of U.S. foreign policy propaganda. Strategic propaganda is meant to create a situation conducive to the attainment of U.S. foreign policy goals in a given period, while tactical propaganda is concentrated on solving current political problems. U.S. strategic propaganda is addressed to comparatively small groups of people capable of influencing public opinion or the government of the particular country. It is for them that the bulk of books, learned journals and other academic publications are as a rule intended. Cultural and educational exchanges serve the same purpose. The main function of U.S. tactical propaganda is interference in specific current events, their comment and appeals to the broadest possible audience through newspapers, radio and television.

U.S. propaganda services devote special attention to determining the appropriate object for propaganda and the most feasible means of carrying it out. For instance, printed matter is preferred if a country is highly literate; radio, television and propaganda films are preferred if literacy is low.

Since the launching of the Echo-I satellite in the 1960s, the U.S. press has debated opportunities for using outer space for broadcasting propaganda round the world by furnishing the communication satellites with up-to-date electronic equipment capable of generating powerful signals and thus making it possible to receive directly from the comsats without any relay stations. General Electric has estimated that in the early 1970s the USIA will have a system of communication satellites capable of broadcasting radio and TV programmes at frequencies and with scanning typical of the receivers in America and Europe.⁴

* * * * *

In 1968 . . . [in] a learned survey—*United States Foreign Policy* . . . [the author] wrote:

. . . The immediate aims of United States propaganda programmes might range from building support for an existing government to promoting its overthrow or urging its citizens to defect; from encouraging a climate of opinion which will enable a friendly government to contribute military forces to the war in Vietnam to encouraging an Eastern European Communist Country to assert increasing independence from the Soviet Union; from promoting attitudes conducive to economic development in a new African State to minimising support for Castroism in parts of Latin America.⁵

The propaganda services of the [current] Administration are sparing no efforts to implement these subversive aims of U.S. foreign policy propaganda. The . . . U.S. "information facilities" continue to serve the global aspirations of U.S. imperialism. They still seek importunately, though vainly, to create in people's minds an embellished image of the U.S. as the "world leader". But all "psychological efforts" of U.S. imperialism's ideologists are futile.

In the spring of 1969, the U.S. Congress published a collection of documents, a sequel to the studies conducted by leading American experts on the U.S. "image" abroad. The collection also included recommendations aimed at improving the "Image." A very important goal of U.S. propaganda has always been to create an embellished U.S. "image" and a distorted "image" of its ideological adversary, corresponding to the general political lines and interests of the U.S. ruling circles.

The above-mentioned collection, entitled *The Future of the United States Public Diplomacy*,⁶ contains numerous facts attesting to the sharp deterioration of U.S. "image" in recent years and failures of U.S. foreign policy propaganda; the U.S. "image" abroad has considerably deteriorated owing to such events as U.S. aggression in Indochina, racial unrest and the increasing crime rate. The aforesaid experts conclude: "The mental picture that many foreigners have of our nation is increasingly that of a violent, lawless, overbearing, even a sick society."

They blame this unsatisfactory state of affairs partly on "modern communications" which tend to "stagger negativism". However, the conclusions also contain some rational ideas, such as, that foreign policy "begins at home", that foreigners judge the U.S. on its record not on its words, and that "propaganda of action is far more powerful, expressive, and persuasive than words." At the same time, these experts propose that the government should intensify efforts to prepare and implement all aspects of foreign policy propaganda, which, as they hold, ought to improve the U.S. "image" abroad and, as far as possible, denigrate socialism and the socialist community.

The Pentagon and all the forces that make up the U.S. military-industrial complex are playing a leading role in the ideological expansion of U.S. imperialism. Pentagon propaganda is not only militaristic; it also fully reflects the viewpoint of the forces which comprise this complex and provide it with ideas.

* * * * *

Pentagon foreign propaganda aims to uphold the morale of U.S. servicemen as well as to "manage" public opinion in the countries where U.S. troops are stationed. According to the information released by the Pen-

tagon, the radio and television services of the U.S. armed forces, numbering more than 350 radio and 90 TV stations, work for U.S. troops abroad.⁷ This vast radio and TV network is intended both to brainwash U.S. Defence Department personnel and to maintain the cold war and war hysteria atmosphere abroad.

Special groups of war correspondents are busy producing anti-communist films which also praise militarism and other "blessings" of the American way of life. For instance, Pentagon film-shooting groups brought 118 films from Vietnam in 1968 alone. Not one film, however, attempted to give an objective notion of the Vietnamese war . . . An international affairs expert at the University of Maryland observes that all films are nothing but dirty propaganda about the U.S. servicemen's "noble mission" in Indochina.

The Pentagon also puts out films which, at first glance, are unconnected with military affairs, yet incite blind hatred for Communism. They include *Free People* (the script written in the spirit of rabid anti-Communism cynically slanders life in socialist countries), *The Line is Drawn*, *The Road to the Well*, and other similarly stereotyped productions.

Pentagon military-propaganda services produce their own films and help private companies whose films are of interest to the Defence Department. Thus, in the spring of 1969, [a] congressman . . . openly condemned the backing lent by the Pentagon to actor John Wayne and his company in the filming of the ultra-militaristic film *The Green Berets* glorifying the "feats" of the U.S. Task Force in Vietnam. [The author] stressed that "the glorified portrayal of the Vietnam War, which is the heart of this film, raises serious questions about the Defence Department's role in using tax funds for direct propaganda purposes. . . . This alliance of Hollywood and the Pentagon seems to have brought out the worst in both institutions."

CBS, NBC, ABC and U.S. private corporations supply their productions to Pentagon radio and television services free of charge. The Pentagon also uses The Voice of America, operated by the USIA. The magazines' and books' divisions of the Pentagon Office of Public Affairs puts out special military and military-propagandist publications. The Defence Information Office holds press-conferences and publishes and distributes pamphlets, books, magazines and newspapers under more than 125 titles with a total circulation of close to ten million copies.

The reporters of U.S. newspapers and magazines who write "favourably" about Pentagon activities are asked to write for military magazines which pay them substantial fees. At the same time, the journalists who cover events objectively, the war in Vietnam in particular, find themselves under the surveillance of the Pentagon security service. Such measures by the Pentagon special services make the civilian mass media distribute the information which comes directly from the Department of Defence or the newspapermen who are very close to it and have won a reputation as ultra-patriots.

The Pentagon special services try hard to influence the younger generation outside the U.S. ideologically and psychologically, achieving this through the Defence Information School of the Defence Department. It was set up soon after the Second World War and now covers 28 countries on three continents where 8,000 Pentagon-appointed instructors teach over a million U.S. servicemen's and local children.

... The dangerous influence of this "state within a state," is increasingly more openly discussed in U.S. sociopolitical and academic circles. A conference on U.S. national goals and war budget was held in Washington in March 1969. The 45 Congressmen and 19 academics and experts who took part in the conference severely criticised Pentagon activities. Pentagon leaders, however, ignore U.S. public criticism. Speculating on the "Communist menace" and fanning chauvinism and obscurantism, Pentagon top-brass and the military-industrial complex seek to fashion the American way of life after a pattern of a "garrison state."

The ramified apparatus of the U.S. State Department, which of late has been more widely used for foreign policy propaganda, is one of the most important channels of U.S. ideological expansion.

The speeches and statements of the Secretary of State and other U.S. foreign policy leaders, as well as the messages sent to heads of state, are invariably meant to influence public opinion in those countries. At press-conferences regularly held by the State Department, its high-ranking officials brief reporters on various aspects of U.S. foreign policy. Even in the U.S. the substance and quality of information given to the reporters at those press-conferences are often severely criticised. . . . Washington correspondents often feel that the State Department "is seeking to use them as instruments of psychological warfare." ⁸

The ideological and "psychological" action of the State Department is not confined to press-conferences and briefings. It is also evident in the practical measures carried out in cultural and educational exchange arranged, as a rule, jointly with the USIA. As an important form of foreign policy propaganda, such exchanges have served and continue to serve the global aims of U.S. foreign policy. A report of the Bureau of the Budget of the House of Representatives in charge of the State Department's budget openly stated: "Culture for culture's sake has no place in the United States Information and Educational Exchange Program . . . cultural activities are indispensable to all propaganda . . .".⁹

... [A] former U.S. Ambassador to the UN . . . has said that contacts with East European states are not "awards" conferred on communist governments but a means of getting Western ideas through to Eastern Europe and diminishing dependence on the Soviet Union. It was hardly surprising therefore that . . . [the] former head of Radio Free Europe, one of the main centres of anti-Communist and anti-Soviet propaganda, was appointed Assistant-Secretary of State for cultural and Educational exchange.

The notorious American aid to foreign countries administered through the Agency for International Development (AID), a special body of the

State Department, is but a poorly camouflaged political diversion by U.S. imperialism against peaceloving peoples. A professor who served for many years in the State Department, the AID, Department of Trade and the CIA, disclosed the ideological and political meaning of the aid when he said that its most important function was "to counter the spread of Communism," and emphasised that it was just these considerations that are "preponderant in decisions to provide aid" ¹⁰ to a particular country.

Specialists from developing countries who come to the U.S. under the AID exchange programme are taught not so much technical subjects as unquestioning admiration for the virtues of the American way of life. On the other hand, U.S. specialists sent abroad take special courses of training in accordance with the ideological and political policies of the U.S. State Department.

The Peace Corps comes under the State Department and is an instrument of ideological expansion in developing countries. Its volunteers are often regarded by the governments of the recipient countries as subversive and, consequently, as having nothing in common with "strengthening mutual understanding" avowed by the Corps Charter.

The most important objective of U.S. ideological expansion carried out by the strategists and tacticians of American foreign policy propaganda is to split the ranks of imperialism's opponents and to sow discord between the socialist countries, to poison the minds of workers, and to denigrate socialism. Bourgeois propaganda seeks to break up the common front of struggle for peace and socialism by appealing to nationalistic and chauvinistic feelings, juggling with all manner of anti-socialist ideas and trends and speculating on the slightest errors of its ideological adversaries.

* * * * *

The world balance of forces is continuing to change in socialism's favor. Despite all their variegated attempts, the capitalist ideologists are incapable of turning the clock back. The influence of the noble and lofty Communist ideas on world sociopolitical development is irreversible.

INFLUENCING POLITICAL CHANGE BY BROADCASTING TO THE SOVIET UNION*

BY ROBERT L. TUCK**

There is competition for the ear of the Soviet listener in international broadcasts. Listeners are becoming more discriminating and expect to hear more interesting programs than before. The role of international radio is that of a source of information and ideas, rather than an instrument of mass persuasion.

ABSTRACT

External communications are an increasingly important factor for influencing political change in the USSR. The number of citizens who can hear radio broadcasts from abroad has increased fifteen times since Sta-

*Prepared for delivery at the 1966 Annual Meeting of the American Political Science Association, Statler-Hilton Hotel, New York City, September 6-10. Reprinted with the permission of the American Political Science Association and the author.

**Author's Note:

When this paper was written in 1966, there was only scattered evidence of efforts by individual Soviet citizens to challenge the regime by insisting on their legal rights to justice and freedom, that is, to work for political change in their own interests. The paper was, therefore, an outline of assumptions and suggested methods and techniques for communicating with the Soviet listener to overcome his isolation and to broadcast relevant information and ideas which would help him in his own efforts toward political reform.

During the intervening six years it has become possible to test these assumptions and the broadcasting methods and techniques to an increasing amount of concrete documentation—that is, to *samizdat*, the “self-published” and distributed materials of dissent and protest which describe the thinking and actions of individuals who contribute to a small but vital democratic movement within the USSR.

Samizdat is a communication among the democrats; they take considerable risks to get documents to the West to inform and win support of world opinion; they depend on radio from abroad for further dissemination back within their own country. (As author Alexander Solzhenitsyn stated in his interview in *The New York Times* of April 3, 1972, “If we ever hear anything about events in this country, it’s through them,” referring to Radio Liberty.)

As *samizdat* documents arrive in the West they provide the broadcaster with program content to inform Soviet listeners about the efforts of the democrats and to win support for their often heroic insistence that legal guarantees of individual rights be implemented for all Soviet citizens.

This mutual interplay and interaction of supporting information and ideas between external broadcasters and their Soviet listeners has become a unique form of communication. By studying and broadcasting *samizdat* documents along with other relevant information and ideas denied the audience by a regime which insists there can be no “peaceful coexistence” in ideology, today’s international broadcaster has an unprecedented opportunity to help his Soviet listeners in their own quest for justice and freedom—and therefore to hasten political change. [April 1972]

lin's death. The Soviet regime has been slowly yielding to the demands of modern industrial society for a freer interplay of economic forces and individual initiative; these pressures for economic reform point toward corresponding relaxation in the political sphere.

A radio broadcaster therefore can play a role in influencing political change (1) by regarding international radio as a source for stimulating information and ideas rather than an instrument of mass persuasion or manipulation; (2) by continual analysis and reassessment of the strengths and weaknesses of the Soviet system and regime policy; (3) by continual study of the attitudes and aspirations of the vast complex of Soviet listeners (the younger generation, rank-and-file Party members, the technical and creative intelligentsia, et al); (4) by formulating broadcasting objectives which conform to the aspirations of the audience for faster political, economic, and social reform; and (5) by presenting his material in an effective manner which appeals to the basic patriotism of his listeners and their own best human instincts and self-interest.

* * * * *

THE ROLE OF INTERNATIONAL RADIO

International radio is a source of information and ideas, rather than an instrument of mass persuasion. There are some 26 million radio sets in the USSR capable of receiving short-wave broadcasts. [In 1971 the estimate was 30 million.] They are in the hands of individuals who exercise some freedom of choice in what programs they listen to and who are not captive to the local networks of loudspeakers which the regime saturates with its official line. The omissions, distortions, and dreary political fare of Radio Moscow very often encourage Soviet listeners to seek foreign stations in preference, but listeners will not continue to search for other stations which do not satisfy their wish for stimulating information and ideas.

Radio broadcasts in themselves are unlikely to result in overt political action by Soviet citizens against a regime which has kept itself in power by a tightly controlled party and police apparatus for almost 50 years—nor should this be intended. Appeals for direct action would, in all probability, disappoint the broadcaster by their lack of success. Whether supporters of the regime or its committed opponents, Soviet listeners would resent calls from abroad [that would] expose them to regime retaliation or punishment, and [furthermore they would] tend to discount all other ideas and information broadcast by the same station as, in their minds, similarly irresponsible.

Thus, any suspicion in a listener's mind that a station is trying to manipulate him for its own purposes would be ruinous to the station's credibility, and credibility is the *sine qua non* of audience impact.

The broadcaster must therefore accept the more modest—and more challenging—role of trying to stimulate independent thinking on the part of the individual members of his audience. Listening to broadcasts from abroad is now easier and no longer as dangerous to Soviet listeners as it

was in the past. There is more competition for the listener's ear from both other international broadcasters and from Soviet media which offer television and entertainment. The broadcaster must therefore assume that listeners are becoming more discriminating and expect to hear more interesting programs than ever before.

* * * * *

SOVIET LISTENERS.

In addressing the Soviet audience as a whole, one must bear in mind that it is basically patriotic, young, and therefore future-oriented, and made up of varying interest groups. Broadcasts can be directed at; but cannot be limited to, specific categories of listeners; anyone with a receiver might hear them, and thus nobody should be unnecessarily or carelessly excluded and thereby, perhaps, offended.

At the same time, a broadcaster who wishes to influence political change in the USSR must select program material on the basis of its appeal, either directly or indirectly, to those groups of listeners who have political potential: the younger generation, rank-and-file members of the Communist Party; certain occupational groups, some of primary, some of secondary potential; and the various nationality groups of the USSR.

Appealing to politically influential listeners is a challenge, because many of them have a vested interest, active or latent, in the present system; they may simply not be interested in fundamental change, they may fear it. The basically patriotic majority frequently identify their own interests with those of the regime and tend to react defensively to criticism of that regime. Therefore they must be appealed to on the basis of their own patriotism and self-interest and be persuaded that many of the regime's policies are not in the best interests of either their country or themselves. Many, if not most, of them are already well aware of the shortcomings of Soviet society and are trying to improve their situation. The broadcaster's greatest challenge today is to follow these trends in listener attitudes, understand them, and then help his Soviet listeners by supplying them with new and pertinent information and ideas with which to work for faster and more lasting improvement.

* * * * *

BROADCASTING OBJECTIVES

In formulating and implementing his objectives, the broadcaster will necessarily exercise some value judgments of his own. His program must be directed toward a definite goal and it must indicate some sense of mission, if there is to be a direction and purpose about his work. But the broadcaster cannot impose his own values on his listeners; his values must coincide with those of his listeners, if he is to influence political change inside the target area.

The aspirations of Soviet citizens are in the direction of freedom and democratic political institutions which represent the best interests of the majority of citizens and peoples of the USSR; therefore, this should be the goal of the broadcaster. It follows that his mission should be to

encourage and help his listeners to work toward replacing the present oligarchical political system with one which is representative of and responsive to the will and aspirations of the entire population of the USSR; [and] to provide his listeners with information and ideas which will enable them to work more effectively for change in their own interest.

Broadcasting objectives which would fulfill this mission would encourage (1) practical, democratic political alternatives to present Soviet practice; (2) social and economic reform in the interests of the population of the USSR; and (3) cultural diversity and freedom of exchange of information and travel for Soviet citizens. Another objective would be to correct omissions and distortions of official Soviet media and try to undermine Communist ideology, not by arguing with it in its own terms but from the point of view of showing that it is irrelevant and a bar to serving the real needs of the people.

In the writing of scripts it is necessary to concentrate on specific themes which encourage political, economic, and social reform and freedom of information and travel. On the eve of a CPSU Congress or Central Committee plenum the broadcaster should show the need for true inner-party democracy instead of "democratic centralism," [and] for hastening the course of de-Stalinization by opening party and state archives to facilitate writing the full history of the 1930s, etc. When it became apparent that the writers, Sinyavsky and Daniel, were to be tried, broadcasters used this occasion to carry foreign press reaction and comment in defense of the two as artists and patriots. . . . It is not often that individual broadcasts themselves can be measured for their direct audience impact; occasionally, however, as with the coverage of the Sinyavsky-Daniel trial, the heated rebuttals by official Soviet media indicate their effectiveness.

PRESENTATION OF BROADCAST MATERIAL

The soundest objectives based on the best possible analysis of the Soviet internal situation become academic if the presentation of individual scripts is not effective. If the attitudes of listeners toward their own situation and toward the broadcaster are disregarded, if scripts are not tailored directly to the attitudes and aspirations of a particular audience, there is little hope of any effect, to say nothing of influencing political change.

In addition to sound radio production and journalistic techniques to capture the listener's attention, to entertain and stimulate by effective argumentation, and to present a convincing case; a special dimension is required for the Soviet listener. Despite widespread discontent and the numerous tensions in Soviet society, the bulk of the evidence indicates that typical Soviet listeners are deeply, if not fiercely, patriotic. Indeed, the sacrifices and repressions of recent decades followed now by the realization that the USSR lags far behind other industrialized countries in

its standard of living seems to spur Soviet citizens to greater efforts. While often very critical of the Communist regime and its policies, they are also quick to defend the USSR against foreign critics.

The question of the tone of broadcasts thus becomes of paramount importance for anyone trying to influence political change inside the USSR. All criticism of Soviet reality must be clearly in the interests of Soviet citizens. It must encourage constructive change and not simply denounce the negative aspects of Soviet life. The temptation to quote internal criticism in the official Soviet press at length to the Soviet audience should be resisted—because the listener has already read it or heard it and because the regime uses this criticism as a device to build up support for its own purposes. Instead the broadcaster should help the Soviet citizen to read his own press critically and in his own interest, asking whether official explanations are the correct ones, suggesting other more basic reasons, and supporting trends toward specific reforms which are being discussed inside the USSR and abroad. When warranted and the facts are convincingly presented, he can also suggest that limited, piece-meal reforms have only a limited effect and that more basic changes in the system are necessary to achieve lasting results.

At the same time the broadcaster must refrain from appearing to exploit positive internal developments for what may appear to be his own “anti-Soviet propaganda” purposes. Such treatment could be dangerous to those Soviet citizens who are working for constructive change and could hinder their efforts. Thus, when a Soviet writer produces a new work which challenges some aspects of the system, when an economist advocates decentralization of planning and controls, when a party member calls for more inner-party democracy, etc.; the radio commentator should not suggest that such developments are anti-regime acts, but rather treat them as attempts to help Soviet society, and as being motivated by more patriotism than is shown by the party bureaucrats who oppose such innovations.

By consistently taking this approach, the broadcaster avoids giving his internal Soviet critics grounds for accusations that he engages in “anti-Soviet propaganda,” and perhaps hindering the forces of constructive change already at work inside the USSR.

[CONCLUSION]

In conclusion, it should be emphasized that the individual broadcaster himself is the most important, and yet most intangible, element working to influence political change in the USSR by external communications. He must be an effective communicator possessing the technical skills of writing and speaking, but most important is his attitude toward his audience. He must be motivated not so much by hatred of Communism and the Soviet regime as by dedication to the cause of freedom for people who want it badly enough to work continually toward it. He must be committed to the possibility of fundamental change on a long term basis in

Soviet society. He must be patient and not discouraged at the lack of visible progress; when setbacks occur he must not let himself or his listener become frustrated and apathetic but should encourage the search for yet new approaches. And he must develop the knack of vicariously sensing the opportunities which his listener can use, suggesting them to the listener without overtly telling him what to do or how to do it, and thereby helping the listener to help himself in his own interest.

The increasing opportunities for political change which have emerged in Soviet society in recent years offer encouraging prospects for the future.

By continually studying and refining his own assumptions about the role of radio communication per se, the actual political situation in the target area, and the complex of varied attitudes of his many listeners toward that situation and their own aspirations; by formulating objectives which coincide with the basic human instincts and self-interest of his Soviet listeners; and by presenting his material to the audience in a corresponding manner, the broadcaster can effectively hasten political change in the USSR by external communication.

CONTENT ANALYSIS

Analysis of content, unlike source analysis, focuses upon the message. Beyond that generalization, however, content analysis is characterized by diversity in objective, method, and results.

Although content analysis is one of the oldest forms of propaganda evaluation, the advent of the computer to assist the human mind has made the use of previously impractical methodologies now eminently feasible. This is largely the result of the machine's ability to process, store, and retrieve massive amounts of information with great speed.

The lead-off article in this section discusses the use of computers in the coding and analysis of materials on the People's Republic of China. Both of the first two papers utilize quantitative content analysis. Although quantification has undeniable advantages for certain objectives,¹ the use of qualitative techniques is equally important and may be preferable in individual cases. The last three selections illustrate the varied uses of qualitative analysis of propaganda content.

CODING AND ANALYSIS OF DOCUMENTARY MATERIALS FROM COMMUNIST CHINA*

BY PAUL WONG

The methods of survey analysis are adapted to an analysis of documentary materials. The author contends that the two major types of content analysis—qualitative and quantitative—are indispensable. Both should be used in conjunction with each other.

In this paper the argument is made that the utilization of a qualitative-quantitative mode of analysis may yield valuable insights on the social, economic and political developments in Communist China. The method of coding involved in the qualitative-quantitative mode of analysis is discussed. Concrete examples are drawn from a content analysis project currently in progress at the University of California at Berkeley.¹ Finally, several specific hypotheses encountered in the content analysis project are presented to demonstrate the utility of the qualitative-quantitative mode of analysis.

DISPARITIES IN THE AVAILABILITY OF DATA

The most important source of empirical data on Communist China comes from documentary materials such as the *People's Daily* (Jih-min Jih-pao). Researchers spend long periods *scanning* through Chinese Communist documents and other potential sources of data. The difference between "Datum" and "material" must be maintained and clarified. By material is meant a document in its original form such as an editorial in the *People's Daily*. Materials are transformed into data by some scheme of categorization. Materials are, therefore, the sources of data. Data are generally at a higher level of abstraction than materials, and are, in general, more applicable for scientific investigation. Indeed, one of the shortcomings of research on Communist China has been the failure to transform materials into data before using them for scientific investigations.

There are disparities in the degree of availability of data for the three different but highly correlated dimensions of the Chinese Communist social system—that is, the political, social and economic dimensions.² It is proposed here that an effort should be made to collect systematic data on economic, social and political structure and dynamics on Communist China on both regional and national levels. In so doing, the gaps or disparities in the availability of data would diminish. Furthermore, a general analysis of some problems employing data from all three dimensions would become possible.

*Excerpts from "Coding and Analysis of Documentary Materials from Communist China," *Asian Survey*, VII, No. 3 (March 1967), pp. 198-211. Reprinted with the permission of *Asian Survey*.

A SYNTHESIS OF QUALITATIVE AND QUANTITATIVE ANALYSES

Experienced researchers have the capacity to "read the lines" to analyze overt meanings as well as "between the lines" to ascertain less obvious implications and inferences. At the same time, it is essential to raise the question of objectivity. Qualitative treatment of documentary materials is indispensable, but it is argued here that the reliability and validity of qualitative analysis can be increased and its importance and value enhanced by means of a quantitative analysis of the same materials and then synthesizing the results achieved through both approaches.

It is particularly in the coding and classification of documentary materials from totalitarian or closed societies that quantitative content analysis can make a lasting contribution. To some extent, this is a consequence of the fact that many methods of social science research are not applicable to closed societies. Quantitative content analysis was used extensively during W.W. II to study Nazi propaganda, but there was a period of about ten to fifteen years thereafter during which there was a decrease in the number of projects using content analysis methods. The reasons for this decrease were: (1) manual coding and analysis placed a serious limitation on the amount of materials which could be treated in any single project; (2) traditional content analysis involved essentially the inspection of univariate distributions (technically called "marginals"), or, at most, bivariate distributions (technically called "zero-order" relationships). Many researchers felt that the analysis of marginals and zero-order relationships did not provide an adequate explanation of the empirical phenomena in which they were interested; and (3) the lack of foundation support on content analysis projects.

In the past five years, there has been a reemergence of interest in content analysis, facilitated by the rapid development in data processing facilities and computer applications in the social sciences. In the area of content analysis, the development of social-psycholinguistic dictionaries has made possible the machine coding of original materials—especially in English but even in some foreign languages. Due to the extraordinarily complicated structure of the Chinese language, machine coding of original documents is not yet feasible. But recent development in optical scanning devices indicates that it is likely that machine coding of original Chinese documents will be possible before too much longer.

The present project may be regarded as an intermediate stage between traditional content analysis and machine content analysis in that the coding is done manually but the analysis is done entirely by high-speed electronic computers. Already in the pilot study, 2,316 articles or cases have been coded. In the larger study, more than 35,000 cases will be coded, making it the most extensive systematic content analysis ever attempted on a single polity.

The inclusion of diverse but systematic queries in the coding schemes

means that an analysis of a total society will be possible. Although a manual coding system is used, this also has some advantages in that it facilitates the inclusion of both rigidly structured and open-ended items in the coding schemes. In this manner, some significant but unforeseen information will not be lost. One major methodological assumption in this study is that an article or speech in a newspaper is similar in many ways to a human respondent. The researcher can literally "ask" the article both structured and open-ended questions; the answers to these questions may be coded in the same way as a respondent's answers to interview questions in survey research. A major difference between a survey interview and coding of content materials is that whereas in the former the human respondent is asked to answer questions about social background and attitudes toward various subjects for most of which he has answers, in the latter the coding scheme tends to include a great number of items which only inquire about their presence or absence.

Methods of survey analysis are to some extent applicable to content analysis. I have in mind especially the method of "elaboration" developed at Columbia University.³ Essentially, the method of elaboration attempts to ascertain the validity of a relationship between two variables by controlling other variables. The relationship between two variables is called a bivariate or zero-order relationship. In controlling each additional variable in the same table, the order is raised by one. If used carefully, the method of elaboration may be of immense value in content analysis; it may also make possible the application of content analysis for explanatory purposes.

The crucial point raised in this paper is not that qualitative methods should be rejected. On the contrary, qualitative considerations, in principle, should temporally precede quantitative considerations, although not infrequently *ex post facto* hypotheses are discovered after the analysis of quantitative data. In effect, a synthesis of the two methods should be attempted, particularly in the area of research on Communist China. This synthesis may perform one or more of the following functions:

1. Compare and contrast the results obtained from the two analyses, and thus facilitate the validation of research findings.
2. To provide fresh insights and hypotheses for the quantitative analysis, and vice versa.
3. To synthesize hypotheses suggested by current research literature and hypotheses suggested by quantitative analysis. In this respect, quantitative analysis performs an explanatory function—that is, it helps in providing a systematic framework upon which a logical explanation of some aspects of the total social system can be based.
4. From this synthesis of ideas and the systematic framework resulting from it, new hypotheses may be derived for further research.
5. Through quantification, an immense amount of documentary materials can be transformed into data, which may be used for secondary analyses.

6. Criteria for distinguishing the difference between "manifest content" and "latent meanings" can be provided.

METHOD OF DATA COLLECTION

The content analysis project on Communist China covers a number of time periods. A great deal of attention is naturally given to the *People's Daily*, the official organ of the Communist regime. In addition, a number of other newspapers have been selected to study internal variations, including geographical and ideological variations. The examples presented in a later section of this paper relied only upon data collected for May, August, and December in 1957. The data consist of headlines of the *People's Daily* appearing in the *People's Daily Monthly Index*. In sum, 2,316 headlines of articles were coded, and constitute the "cases" for this paper. The sample consists of all headlines appearing in every fourth daily edition of the *People's Daily*. For this content analysis study, two general coding schemes were devised. In this paper, only a minute portion of the results obtained by means of the first coding scheme are presented for the purpose of illustration.

The coding schemes were developed on the assumption that newspapers, or any medium of mass communication, are subject to internal and external influence and are sensitive to such influence. In Communist China in 1957, newspapers were, on the whole, effectively controlled by the regime. The *People's Daily* as the official party and governmental organ, functioned in propagating the official policies of the regime, in eliciting mass participation, and as an agent of social control. One can, therefore, classify the news items appearing in the newspaper and on the basis of this information make inferences concerning the conditions of the system. In this respect, one assumes that the newspaper, as a product of the system, at the same time plays a role in shaping the system. What appears in the newspaper is of tremendous value in studying conditions of society, especially in Communist China—a relatively "closed" society from which interview data cannot easily be obtained.

An important aspect of the coding schemes is the classification of subject matter categories appearing in the *People's Daily*. After experimenting with different methods of classification, we decided to use, by and large, the same categories as those appearing in the *People's Daily Monthly Index*. This classification may be regarded as the Chinese Communist elite's "perception of the situation." The number of items devoted to specific subject matters may be regarded as an index of the amount of attention focused on these subjects by the leadership. Aside from the subject matter categories, we have also included geographical, individual, organizational institutional, and other social, economic and political categories.

Our data were coded in such a manner that the same data may be analyzed in several different ways by using a different "unit of analysis":

1. The headline or article as the unit of analysis.

2. The person as the unit of analysis. For every case we include all the information about the person together with the information about the headline or article in which the person's name appeared. Note that since a person's name may be mentioned in different articles (contexts), the data offer an opportunity to study specific persons under varying contexts. In this manner, we may be able to examine how, for example, a Central Committee member is related to different policies.
3. The organization as the unit of analysis. This is similar to the explanation given for the person as the unit of analysis.

In addition, we may use groups of persons as the unit of analysis—for example, Central Committee members in comparison with non-members. Also, we may use type of organizations as the unit of analysis—for example, political in comparison with non-political organizations.

ARTICLE AS THE UNIT OF ANALYSIS

In this section, we will report on some empirical findings using the headline as the unit of analysis. We have a total of 2,316 cases. The headline as the unit of analysis is not to be confused with individuals mentioned in the headline as the unit of analysis. In the former case, our interest lies in characterizing the content of the headline; in the latter case we want to characterize the individuals in terms of two sets of data. The first set of data refers to the socio-political-economic background of the individuals, which are more or less constant in a given period. The second set of data relates the individual back to the content of the headlines to ask questions such as in what type of news content is the individual most likely to be mentioned. Analysis using the individual as the unit may be considered as a study of leadership structure and decision processes. Analysis using the article as the unit may be regarded as a study of the Chinese Communist's "definition of the situation." In this respect, the two analyses supplement one another in facilitating an interpretation of the Chinese Communist world view and domestic outlook. The analysis on organizational structure and processes adds a third dimension to the interpretation.

INDICES OF IDEOLOGY

Definitions: Schurmann's definition of ideology as the manner of thinking characteristic of an organization has been followed.⁴ The pervasiveness of ideology in Communist China cannot be denied. Although ideological discussion and education permeate every level and aspect of life, the number of references to ideology in the 1957 issues of the *People's Daily* used for this study was not great. This was not surprising, given the fact that every reference to ideology in the *People's Daily* had to be considered authoritative.⁵ To an experienced Western observer or a Chinese "sensitized" to the Chinese Communist documents, the appearance of even a single term such as *lilun* (roughly translated as theory) is of

paramount importance in explaining or predicting changes in ideology. To some extent, the small number of references is also a consequence of the fact that a rigid definition of ideology is used here. Ideology, in this context, refers to any of the various "isms" and "thought." Types of ideology are classified according to the charismatic leader who is associated with the particular "ism" or "thought." For example, Maoist thought is classified as Chinese, while Leninism is classified as Russian. General ideology does not refer to any specific individual. While it is plausible that an ideology may, at some point in its development, transcend the confines of national boundary and become universal, it is maintained that, at least in Communist China, the nationalistic element in different ideologies can still be distinguished from their universal meaning. For example, Marxism-Leninism is still foreign and Russian, while Maoist thought is Chinese, in spite of their presumed universal applicability.

Analysis: Of the eighteen references to ideology in the May, August and December 1957 issues of the *People's Daily*, eleven referred to Chinese ideology, three to foreign ideology, and four to general ideology. The fact that Chinese ideology predominated supports Schurmann's hypothesis concerning decentralization policies in the latter part of 1957 as well as the fact that these policies coincided with a conscious attempt to develop an economic model which was not merely a mirror image of the Soviet economic model.⁶ Change in emphasis on different types of ideology was but one of the many changes which occurred in 1957. Schurmann pointed out that during the first fourteen years of the Chinese People's Republic, the leadership applied two distinct developmental strategies, one for each of the two five-year plan periods.⁷ The terminal year of the First Five-Year Plan, 1957, was crucial not only for economists, but also for sociologists and political scientists since many social and political changes occurred. In the present discussion, we are only interested in the ideological dimension. A detailed examination of the hypotheses raised by Schurmann will be treated elsewhere.

In a strict sense, our data on Chinese versus foreign ideology do not enable us to test the hypothesis that there was a shift in ideology accompanying the transition from the First to the Second Five-Year Plan period. Schurmann postulated that China had gone through two radical phases, one during the First Five-Year Plan period when the Chinese Communists tried to repeat the Soviet experience of industrialization, and the second during the Great Leap Forward when they used their own mobilizational techniques to try to achieve an economic breakthrough.⁸ Our corollary to this general postulate is that the transition from the First to the Second Five-Year Plan period was also accompanied by a change in ideology. To test this corollary, data from the First Five-Year Plan period are needed. But until data for 1952 are available and analyzed, such a comparison is not possible.

Since the Foreign Ideology Index is not made up exclusively of

categories on Soviet Ideology, it would be interesting to look at the statistical variation of Soviet ideology categories in comparison with those for Chinese ideology (see Table I).

This table reveals several striking facts. First, there was only one reference to Soviet ideology in the entire sample. This discovery seems to be relevant in the interpretation of the Sino-Soviet conflict. Although a general break in Sino-Soviet relations did not occur until years later, it has been suggested that changes in Sino-Soviet relations began as early as 1956 in connection with the problems of de-Stalinization and with crises in Poland and Hungary. In the early period, according to one authority, it was very much a conflict over the question of the "correct" ideology, although the fact that economic problems were involved—including the stopping of Soviet loans and the disillusionment with the Soviet economic model—cannot be denied.⁹ Another striking fact in Table I is the variation in references to ideology by month; this variation seems to be related to the timing of the "Hundred Flowers" campaign and the anti-rightist campaign which followed. MacFarquhar stated that anything printed before June 8 in the *People's Daily* can be taken to have been straight reporting, June 8 being the day on which the *People's Daily* initiated the counter-attack. Our data show that in May there were nine references to ideology, for August there was none, and for December there were 3. To interpret this variation, let us divide the general event period covering the "Flowers" campaign into four sub-periods:

1. February to April—period of anxiety following Mao's speech on contradictions in February 1957.
2. May and part of June—blooming and contending period during which there was a liberalized policy on ideological debates.
3. Part of June, July and August—period of the anti-rightist campaign.
4. September to December—aftermath.

Our data cover sub-periods 2, 3, and 4. During the period of liberalization on communication, the number of references to ideology was largest.

TABLE I

REFERENCES TO CHINESE VERSUS SOVIET IDEOLOGIES, BY MONTH*

Type of Ideology	May	August	December	Total	Test of Significance** (row difference)
Chinese	9 (11.7)	0 (0)	2 (2)	11 (13.7)	p> .01
Soviet	0 (0)	0 (0)	1 (1)	1 (1)	not significant
Total	9 (11.7)	0 (0)	3 (3)	12 (14.7)	p> .01
Test of significance** (column difference)	p> .01	----	not significant	p> .01	

*Figures in parentheses represent number of references after adjustment for variation in sample size (adjustment ratios for May, August, December, equal to 1.30, 1.07, 1.00 respectively). Tests of significance are based on adjusted figures.

**Kolmogorov-Smirnov 1-sample test for row or column difference.

During the most intensive period, the anti-rightist campaign, there was no reference to ideology at all. Finally, there was a limited reemergence of ideological discussion in December. In May, many individuals openly attacked the regime and its ideology; study groups (*Hsiao-tsu*) were formed and mass meetings were held to discuss alternative ideologies and practices. But after June 8, intellectuals, with the exception of the students, became more apprehensive and reserved. After July 20, when a government resolution was passed whereby in future every student has to produce proof of ideological reliability before he can obtain a job, the students also became more quiescent. It was only toward the end of the year that the situation began to calm down, and even some of those who had been singled out for special reprimand turned up again in public life, although shorn of all influence.¹⁰

Thus there tends to be a minimization of communication about the source and focal point of failure during a crisis situation, especially the role which the elite played in contributing to this failure. However, while there is a *minimization* of communication about the elite's role in policy failure, there is also a *maximization* of statements blaming "others" for this failure. "Others," in this sense, may refer to individuals groups, nations or even abstract ideas.¹¹ There was a tremendous increase in references to the campaigns against counter-revolutionaries (*sufan*) and references to antirightist campaigns in August 1957.

The findings on minimization and maximization of communication, in terms of the number of references in the *People's Daily*, may be expressed in the form of a general hypothesis:

If a policy fails, the system tends to *minimize* communication about the source and focal point of this failure, *minimize* communication about the role the elite played in contributing to the failure, but *maximize* communication in blaming "others" for the failure.

In the case of ideology, the "Flowers" campaign was formally endorsed by Mao; moreover, the effects of the campaign were viewed as extremely unfavorable for the entire system; consequently the restriction on discussion about ideology was so great that there was no reference to ideology at all in the entire sample for August. In December, the threat of the consequences of general discontent became less pronounced, as evidenced by the reappearance of a limited number of references to ideology.

It is by no means assumed that the data on ideology conclusively confirmed the minimization hypothesis mentioned previously; a confirmation of this hypothesis requires testing against a variety of different situations, different types of policies, and different time periods. A comparison of the references to the ideology of Mao, Engels, Stalin, and Lenin reveals three important facts. First, nine of the ten references to ideology of individuals concerned Maoist ideology. Second, there was no reference to ideology of any individual either in August or December. The last fact, when combined with our finding that there was a limited reappearance of references to ideology in December, means that this reap-

pearance was limited to general ideology; apparently ideology of specific individuals was still too sensitive an issue to be discussed in the press.

THE POLITICAL PARTY INDEX

The political Party Index consists of three categories: The CCP (Chinese Communist Party), Communist parties of other countries, and workers' parties of other countries (see Table II). First of all, looking at the total column for all months, we find that of the 209 references to parties, 186 referred to the CCP. On the basis of our limited data, we must accept the validity of the postulate that the Chinese Communist spokesmen consider the Chinese Communist movement as part of the world Communist movement. On a *long-term* basis, this postulate is probably true. It was certainly not accidental that Teng Hsiao-Ping, in an article written for the *Pravda* in celebration of the 10th anniversary of the People's Republic of China in 1957, stated that:

We stand for proletarian internationalism as opposed to all kinds of bourgeois reactionary ideologies of big-nation chauvinism and narrow nationalism. The modern revisionists, as represented by the Yugoslav ruling clique, use bourgeois nationalism to oppose proletarian internationalism, use the nation as cover to oppose international solidarity and have fully become an echo of imperialism. . . .¹²

In fact, Teng's article is a reflection of a more general ideological stand which emphasizes the interdependence of the Chinese Communist and world Communist movements on a long-term basis.

While, on the one hand, we can speak of a *long-term* ideological stand, at the same time, *short-run* fluctuations may occur due to practical considerations made necessary by such problems as domestic crises. In our sample for the latter part of 1957, for example, there was a preponderant number of references to the CCP as opposed to references to foreign Communist and workers' parties. The nature of such short-run

TABLE II
REFERENCES TO POLITICAL PARTIES, BY MONTH*

Party	May	August	December	Total	Test of Significance** (row difference)
C.C.P.	112 (145.6)	4 (4.1)	70 (70)	186 (219.9)	p> .01
Foreign C.P.'s	2 (2.6)	4 (4.5)	9 (9)	15 (15.9)	not significant
Foreign worker's Parties	8 (10.4)	0 (0)	0 (0)	8 (10.4)	p> .01
All Parties	122 (158.6)	8 (8.6)	79 (79)	209 (246.2)	p> .01
Test of significance** (Column difference)	p> .01	not sig- nificant	p> .01	p> .01	

*Figures in parentheses represent number of references after adjustment for variation in sample size (adjustment ratios for May, August, December, equal to 1.30, 1.07, 1.00 respectively). Tests of significance are based on adjusted figures.

**Kolmogorov-Smirnov 1-sample test for row or column difference.

fluctuations is worth exploring in future research, although it will be, undoubtedly, a tedious and costly job. In order to distinguish between short-run fluctuations and sudden changes, one must also have detailed knowledge of the long-term developmental patterns. Methodologically, one should study long-term patterns in detail qualitatively and, at the same time, select a large sample of documentary materials covering a number of years for quantitative analyses. What we have said for time-variation holds, of course, also for regional variation.

Looking at the total number of references to all parties, we found that, in comparing the distribution for the three months, our hypothesis on minimization in communication in periods of stress is again confirmed. There were 122 references in May, but the number was reduced to 8 for August, and finally there was a reemergence of references to political parties in December, the number being 79. Looking at the distribution by month for each party, we found that for the CCP the restriction in communication hypothesis is also confirmed; with 112 references for May, 4 for August, and 70 for December. The number of references to foreign Communist parties or foreign workers' parties during the three months were too few in number to warrant speculation.

ADMINISTRATIVE ORGANIZATION AND DECENTRALIZATION IN 1957

If the proposition that decentralization occurred late in 1957 is valid, then a comparison of the three time periods in our sample with regard to a series of indicators about decentralization in its various manifestations should provide evidence that in the later months of 1957, decentralization was much more widespread than the earlier months of the year. Since our sample consists of three months in 1957—namely, May, August, and December—we will be satisfied if, in fact, there were more indicators of decentralization such as a decrease in emphasis on cen-

TABLE III

REFERENCES TO LOCAL AND NATIONAL AUTHORITATIVE AND ADMINISTRATIVE ORGANIZATIONS, BY MONTH*

Type of Organization	May	August	December	Total	Test of Significance** (row difference)
National	5 (6.5)	3 (3.2)	8 (8)	16 (17.7)	not significant
Local	1 (1.3)	8 (8.6)	14 (14)	23 (23.9)	$p > .05$
Total	6 (7.8)	11 (11.8)	22 (22)	39 (41.6)	$.10 < p < .05$
Test of significance** (column difference)	not significant	not significant	not significant	not significant	

*Figures in parentheses represent number of references after adjustment for variation in sample size (adjustment ratios for May, August, December, equal to 1.30, 1.07, 1.00 respectively). Tests of significance are based on adjusted figures.

**Kolmogorov-Smirnov 1-sample test for row or column difference.

tralized administration and an increase in emphasis on downward transfer of authority, in the later months. Our data on administrative organization show quite clearly that there was a tremendous increase in the references to local authoritative and administrative organization in the later months when compared with May. In May, only one out of six references are on local organization; but in August eight out of 11, and in December, 14 out of 22 references are on local organization. The number of references to national organization in August was the smallest of the three months; this was likely to be related to the minimization of communication in the rectification campaign. Since central or national authority and administration were challenged in the "Flowers" campaign, there was consequently a greater restriction on the discussion of national organization in the rectification period. This restriction in communication on topics related to the sources of strain in the system again confirms the minimization of communication hypothesis formulated earlier.

REFERENCES TO FOREIGN COUNTRIES

On the basis of favorable, neutral and unfavorable references to foreign countries in the *People's Daily*, an index of evaluation of foreign countries was computed using the following formula: (favorable references multiplied by 1) plus (unfavorable references multiplied by -1) divided by all references.

The range of the index is from 1.000 to -1.000 (i.e., from completely favorable to completely unfavorable). Using this index, we found in Table IV that in comparing the countries which recognized Communist China in 1957, Asian countries received the most positive evaluation, African countries second, and European countries the least. It is suggested that the "Bandung spirit," together with the historically-rooted suspicion of European nations may be the cause of the variation in evaluation.¹³ With regard to the countries which recognized neither Communist China nor

TABLE IV

REFERENCES TO FOREIGN COUNTRIES IN THE PEOPLE'S DAILY BY EVALUATION, BY CONTINENT, AND BY RECOGNITION IN MAY, AUGUST, AND DECEMBER, 1957

Continent	Score on Evaluation Index Countries which recognized:		
	Communist China	Neither	Taiwan
North America	-----*	-----	-0.5091
Central America	-----	-----	-0.4000
South America	-----	-----	0.0000
Europe	+0.067	-0.1833	-0.0767
Asia	+0.2306	+0.1500	+0.1041
Africa	+0.1714	+0.1667	-----
Oceania	-----	-----	-----

*denotes not enough cases.

Taiwan, a similar pattern prevails, but evaluation of European countries had become definitely negative. Looking at countries which recognized Taiwan, we find again a similar pattern for Europe and Asia. For countries in the Americas, an additional factor of geo-politics seems to be operating: Central America, being closer to the United States, was given a highly positive evaluation while South America was given a neutral evaluation. The highly positive evaluation seems to be related to an effort to persuade the countries of "Central America"¹⁴ to join the world Communist movement, thus isolating the United States from her neighbors.

CONCLUSION

In this paper, an effort has been made to adopt the methods of survey analysis to the analysis of documentary materials from Communist China. Combining the traditional qualitative method with a quantitative treatment of the same materials, we have shown that, with proper treatment, documents provide not only "impressionistic evidence" but may be used as a tool to give a meaningful and logical "explanation" of empirical phenomena occurring in Communist China.

One critic of quantitative analysis has maintained that this mode of analysis tends to preclude a judicious appraisal of the role which qualitative consideration might play. At the same time, however, he admits that:

quantitative analysis includes qualitative aspects, for it both originates and culminates in qualitative considerations. On the other hand, qualitative analysis proper often requires quantification in the interest of exhaustive treatment. Far from being alternatives the two approaches actually overlap. . . .¹⁵

Therefore, the problem is not to make a choice between qualitative and quantitative analyses—since both are obviously indispensable—but to use both in conjunction with each other. In this respect, quantitative treatment of documentary materials is similar to analysis of standardized questionnaires, while qualitative treatment of documentary materials is similar to the analysis of depth interviews in survey research.

NOTES

¹ The project is being conducted in collaboration with Charles Y. Glock and Franz Schurmann, directors of the the University of California's Survey Research Center and the Center for Chinese Studies, respectively. Their advice in reading an earlier draft of this paper is gratefully acknowledged. I also wish to thank my wife for valuable comments. This is publication A-69 of the Survey Research Center.

POLITE PROPAGANDA: "USSR" AND "AMERICA ILLUSTRATED"*

BY RICHARD A. GARVER

Content analysis showed that the picture magazine produced for U.S. readers by the Soviet Union emphasized such "American" values as industrial growth and a high standard of living. In contrast, the U.S. periodical distributed in Russia portrayed Americans as cultured and imbued with esthetic interests. Unanswered are the questions: Do reader interest and copy sales imply propaganda success? Does a gentlemanly, "non-propagandistic" approach sway readers?

In October 1956 there was distributed in 84 cities of the Soviet Union the first issue of a new publication, *America Illustrated*. A slick, pictorial magazine created by the United States Information Agency, it was reported sold out within a few hours.¹ At the same time, a Soviet publication, *USSR*, was made available at most metropolitan newstands throughout the United States. The two magazines were highly similar: a *Life* magazine format minus the advertising, wide use of color throughout the issue and a gentlemanly reticence in purveying their respective country's wares; i.e., the propaganda was polite.²

This was not the first experience for the U.S. in printing a Russian language magazine for mass distribution in the Soviet Union. From 1945 to 1952 this country had circulated the publication, *Amerika*, in quan-

*Excerpts from "Polite Propaganda: 'USSR' and 'America Illustrated'," *Journalism Quarterly* XXXVIII, pp. 446-484. Reprinted with the permission of *Journalism Quarterly*, copyright holder.

tities ranging from 10,000 to 50,000 copies per issue. Censorship problems and distribution difficulties created by the Russians had stopped the magazine after 53 issues. During this same period the Russians had circulated from their embassy in Washington the *USSR Information Bulletin*. Circulation of the *Bulletin* was stopped in this country when *Amerika* was cut off in Russia.³

After a three-year lapse, an agreement by Washington and Moscow late in 1955 laid the groundwork for a renewal of the publication exchange. This time the publications were to be concerned exclusively with the life and culture (not politics) of the two peoples.

Here, then, was an opportunity to observe a reciprocal propaganda operation in action, an interesting arrangement in which the two opposing political powers agreed to allow the enemy in the "home camp" as long as he employed what might be called in political double-talk, non-propagandistic propaganda. The situation for comparing the two publications was ideal because of the similarity in their formats.

A content analysis was undertaken concerned with a comparison of topics and themes in the two magazines. Although similar in format, were the publications different in content? If so, how?

PROCEDURE

The first 12 issues of each montly publication were analyzed.⁴ All editorial material was coded for subject and theme content. The basis for theme categorization was Berelson's definition, ' . . . a summary or abstracted sentence, under which a wide range of specific formulations can be subsumed.'⁵

Pictures were not coded individually but were used as an aid in coding the textual material. Two *a priori* codes for subject and theme content were developed and added to, as needed, while the coding was in progress. The subject code ultimately consisted of 20 major headings with 102 subcategories and the theme code consisted of 45 themes covering 9 areas of human activity. The coding was accomplished in a graduate seminar in communications.

Each story or article was tabulated on an individual card with the coder noting topic, theme, story length, number and size of accompanying pictures and page location. Coders were instructed to code only what they thought was the major topic of the article and the single, overriding theme. While there obviously was a multiplicity of themes presented in some single articles, the fairly high coder agreement obtained indicates this stricture on coding does not make impossible the handling of multi-subject and multi-theme materials.⁶

RESULTS

Content of Magazines

Content of the two magazines can best be described in terms of

similarities and differences. Topical composition of the two magazines is summarized in table 1.

Similarities

There was agreement between the two magazines as to the subjects which hold greatest interest for the readers. In both magazines the subjects with highest rate of incidence were Economics (95 articles), Culture (68) and Human Interest (66).

In Economics, both magazines stressed industrial development. Although there were 17 subcategories under Economics, 12 of the 48 *USSR* articles and 13 of *America Illustrated* articles concerned growing industry ("Harnessing the Volga's Power" versus "St. Lawrence Seaway"!). While other articles in the Economics category ranged from automation to labor organizations, the predominant image in both magazines of such material was of a vital, growing industrial society.

In the other two categories played heavily by the magazines, there were some differences as to what material was stressed. In Culture, for example, the *USSR* concentrated on literature ("Novelist Mikhail Sholokhov"), while the American publication stressed music ("Jazz in Color").

Other classifications in the culture category were art, classical dance, drama and folklore. And in the third popular category, Human Interest,

*Less than .5%.

an interesting difference was observed. The *USSR* emphasized Babies and Children ("Children Get Special Vacation Care") while *America Illustrated* stressed Adults ("Everybody Bowls"). Perhaps the Russians are well aware of the dominant place children in America occupy.

Differences

The differences in subject content were, however, more striking than similarities. The Russians made great use of material in categories of Sports and Geography, which, in comparison, the American publication did not. It was apparent from magazine content that the Russians believe Americans have slight knowledge of the Soviet Union. *USSR* set out to educate the reader on this subject. It also was evident that American interest in sports is not wasted on the Russians. There were 43 sports items in the first 12 issues of *USSR*. In contrast, the American publication used 17 such items.

The Americans, in their publication, placed greater emphasis on Agriculture and Living Standards than did the Russians. Particular stress was placed on Agriculture: "Farm Wife of Today"; "Life on the Farm"; "Young Cattlemen"; "Farm Girls' Fashions," to cite a few. Living Standards also was a more frequent subject in *America Illustrated*. But in this category the American publication attempted to make its point gently and without angering the Russian reader or making him incredulous.

Theme Content

Aside from a single category—Social Relations—there were distinct differences in theme content of the two magazines. (See table 2). The Russian publication emphasized increasing prosperity ("Amateur Movie Makers"), extensive social care ("All Kinds of Summer Vacations") and the longing for peace ("An Arms Plant Converts for Peace"). This was done with a dominance of themes in the categories of Economic Development, Government and International Relations.

Thirty-six of the 45 mentions of economic themes concerned progress in elevating living standards and expanding industrial output: new apartment developments and low cost housing are being made available; the country's industrial might is burgeoning; the stores are well-stocked; it's a busy but happy life. *USSR* seemed to have borrowed a somewhat reconstituted but easily recognized image of the United States.

In theme material concerning government, the picture of good care for the old and sick, payment of child-rearing costs and the development of a wide variety of other social welfare programs was heavily drawn: "School for Millions"; "The Right to Security"; "In Life's Sunset—an Old People's Home."

A secondary but prominent theme concerning government involved the democratic nature of Russian government: "American Judge Visits a Moscow Court—I Would Have Passed the Same Sentence," Says Judge

*Themes were consolidated into general areas of subject matter, such as Social Relations, and the theme appearing here under each subject heading is merely a representative specimen of each category. There were 45 individual themes.

William Clark of Princeton"; "The Soviet Parliament"; "How I Became a Legislator." Here the reader found that Russian government, particularly at the local level, is run most democratically—and many times by women.

The Russian people were not pictured, however, as totally occupied by narrow national interests. There is a great popular longing for friendlier relations with other nations and a particular desire to increase contacts between the U.S.S.R. and the United States: "Foreign Visitors Are Welcome"; "We Are Willing to Trade with All Countries"; "The International Geophysical Year"; "Atoms for Peace."

In summation, the reader of *USSR* found the Russian people increasingly prosperous, well cared for, democratic and friendly to foreigners.

America Illustrated took quite a different tack, centering on two areas not so heavily emphasized by the Russians: Human Resources and Culture. Great pride was exhibited in the large number of highly creative persons in this country who are allowed to pursue their own interests and thus achieve the highest development of their talents: "They Tread New Paths in Music—Contemporary American Composers Enjoy Great Popularity"; "Jan Peerce"; "Carl Sandburg"; "He's Changing the Face of the Earth—Robert G. Le Tourneau"; "Koreczak Ziolkowski: Mountain Carver." This natural talent, coupled with an innate desire for adventure and challenge, was pictured as responsible for turning many Americans into world figures in science, industry and the arts.

Related to this picture of talent, enthusiasm and individual freedom was a strong emphasis on the cultural life of Americans. Twenty of the 23 items in the theme category, Culture, contained the dominant thought that American music and art are developed to a high level, enjoyed by many of our citizens and much liked by citizens of other countries, namely Russians.

CONCLUSIONS

A content analysis of the first year's issues of the two propaganda magazines, *USSR* and *America Illustrated*, indicated a considerable difference in emphasis. A study of theme and topic content of articles showed that the general impact one receives in reading *USSR* is of a nation concerned with materialistic things: progress, consumer goods, job benefits, vacations. It does not seem an overstatement to say that one can see an obvious reflection of the United States in *USSR* content. It is a calculated effort to show that things Russian are much like things American.

The over-all tone of *America Illustrated*, however, is not of materialism but of *Kultur*. Content reminds one of a symphony: *allegro* (we're talented); *adagio* (we're cultured); *scherzo* (we're free); *allegro presto* (we're enthusiastic). While the American magazine may discreetly advertise our high living standards, the major effort being made is to convince the Russian reader that we are a diverse people with many interests, including a keen taste for life's esthetic adventures.

Both magazines do a creditable job. Forgetting reality for a moment, the Soviet Union appears to be a jolly fine place in which to live—things are progressing so—and the United States shines as an oasis of artistic sensibilities.

One can scarcely guess at the effectiveness of the two magazines. Do reader interest and copy sales imply propaganda success? Does a gentlemanly, "non-propagandistic" approach sway readers? These remain most difficult, unanswered questions.

NOTES

¹ Floyd G. Arpan, "American Tells Its Story Behind Iron Curtain in New 'Slick' Magazine," *Quill*, January 1957, pp. 9 ff.

² Arpan in his article indicates a type of doublethink used by the *America Illustrated* staff when he writes "*America Illustrated* was to be nonpropagandistic . . . The staff was told to make the magazine 'the next best thing to a visit to the United States' and yet to avoid propaganda." *Ibid.*, p.11.

³ "The Russian-Language Magazine 'Amerika,'" in *A Psychological Warfare Casebook*, William E. Daugherty and Morris Janowitz, eds. (Baltimore: Johns Hopkins Press, 1958), pp. 589-97.

⁴ The author wishes to express his appreciation for the cooperation of the United States Information Agency in providing him with translations of the Russian next of *America Illustrated*.

⁵ Bernard Berelson, *Content Analysis in Communication Research* (Glencoe, Ill.; The Free Press, 1952), p. 138.

⁶ A check on coder reliability was made by having all persons code a particular issue in

addition to other issues coded. Initial agreement on theme coding was approximately 85%; i.e., there were two or more coders in disagreement on 15% of the items. Discussion of disagreements reduced this to less than 1%. Initial agreement on subject coding, a simpler matter, was 95%.

PUPPET REGIME CLINGS TO PSYCHOLOGICAL WARFARE*

By the 7th PSYOP GROUP

Auditing adversary broadcasts can indicate the strengths and weaknesses of friendly PSYOP.

REPORT

The Cambodian Information Agency (AIC) (clandestine) in French to Southeast Asia and the Far East, on 2 May said that the traitorous clique of Lon Nol, in its last gasp of agony, is desperately clinging to its only remaining arm, psychological warfare.

AIC stated that the Phnom Penh regime hoped to reverse its desperate situation by pouring out a flood of slander and lies every day by trying to distort the truth by transforming political isolation into popularity, famine into abundance, corruption into honesty, fascism into nationalism, dictatorship into liberty, defeat into victory, and treason into patriotism. AIC compared this to a boomerang and to an imbecile who spat toward the sky, because in both cases that which is tossed out will return to the individual. AIC promised that the lies of the Phnom Penh clique would also return to it.

AIC stated that the propaganda uttered by the Republic of Khmer has become so voluminous and boisterous that the few remaining people outside the liberated areas no longer believe such lies.

Cut off and completely isolated from the masses, Cambodia's traitors do not know who they can trust, even among their associates. Specializing in treason themselves, they smell treason everywhere around them. AIC said high-ranking officials had been tried and shot, but these were the lucky ones because they received some publicity. Others had simply disappeared, not on the battlefield, but in broad daylight on the streets of the capital, never to be seen again. AIC insisted that an atmosphere of mistrust and terror existed in Phnom Penh and that many intellectuals had been arrested and shot for not aligning themselves with the puppet regime.

It is this lamentable situation that the political propaganda apparatus of the traitors tries to camouflage to the eyes of the public. AIC said the clique had built a shaky cardboard castle that masses will destroy. Defeated militarily, isolated politically, suffocated economically, and de-

*Excerpts from "Communist Propaganda Highlights and Trends Analyses," Issue No. 18-71, 7 May 1971, pp. 18-30—18-31.

pressed psychologically, this regime of traitors sold itself to the U.S. imperialists and lives on borrowed time—this explains the confusion and discord in its ranks. No political propaganda, no matter how clever it may be, can deny this old proverb: “When the ship is wrecked, the rats jump into the sea.”

COMMENT

Communist propagandists, such as the Chicom-controlled *AIC*, usually do not specifically mention what is considered by them to be enemy PSYOP. This indicates that *AIC* not only listens to what the Khmer Republic says but is concerned enough to call Khmer programs a pack of lies, conscious deceit, and other derogatory terms. Communist propaganda spends most of its time on Communist successes and is positive to the point of insanity—not realizing in Communist fervor that nothing ever has or ever will be as perfect as the Communists say Communism is. Evidently the Communists have been quite concerned about the effect these Khmer PSYOP programs are having on the people. The Communists must know that Khmer people are listening. Virulent counter-propaganda is usually a sort of “dying gasp,” to use a Communist term. After all, the Communists say that success is everywhere, all is well, and getting better. But is it? *AIC* said there were only a few people remaining outside the “liberated areas” which is untrue in itself, but an effort to disguise the fact that in the “liberated areas,” thousands upon thousands are dissatisfied. They are probably trying to listen to republic of Khmer PSYOP. They know that what the Communists say is not true where they live. These Cambodians also know that they, like other Cambodians, do not find North Vietnamese to be Cambodian liberators.

U.S. VULNERABILITIES AS PORTRAYED IN THE EAST GERMAN TELEVISION FILM, “PILOTS IN PAJAMAS”*

BY HARLEY O. PRESTON, JAMES L. MONROE, and ALDO L. RAFFA

Valuable information can be obtained from the careful analysis of the contents of the propaganda of rival communication activities. For example, while this report yielded only a few tentative conclusions, it did provide many inferences for U.S. policy and actions.

* * * * *

Pilots in Pajamas . . . , filmed in a North Vietnamese prison by producers from the German Democratic Republic (East Germany) and recently broadcasted over GDR television, . . . is a sophisticated propaganda production that undoubtedly will be effective with many audiences. It follows the convincing format of a documentary film in which captured U.S. pilots are individually interviewed by an unseen but

*Excerpts from “U.S. Vulnerabilities As Portrayed in the East German Television Film, ‘Pilots in Pajamas’,” Preston and Associates, Inc., Washington, D.C.: A Technical Report to the Air Force Office of Scientific Research, 1968, AOSR 68-1623. Reprinted with the approval of the Air Force Office of Scientific Research.

obviously a European interrogator. The questions are carefully phrased to sound reasonable and the answers are generally relevant. To provide background and credibility, the interviews are interspersed with scenes of bomb damage, captures of downed pilots, and excerpts from U.S. news films of U.S. pilots at bases in South Vietnam. These scenes and those of the interviews are artfully edited and spliced together into logical sequences and episodes that should prove plausible and convincing to the unwary. Technically, the film is an excellent production.

* * * * *

The present report is limited to the identification of individual propaganda themes in the film that appear to be components of current and anticipated Communist political strategy and tactics not only for the Vietnam conflict but perhaps globally. This report is divided into three sections: Propaganda Themes—their objectives and development in the film; Evaluative Comments—rationale and estimates of impact; and Implications and Tentative Conclusions.

PROPAGANDA THEMES

Captured U.S. Pilots in Vietnam are not prisoners of war. They are war criminals within the meaning of the London Agreement, the basis for Control Council Law No. 10, which was the authority for the International Court at Nuremberg ("War Crimes Court"). The findings of this Court were unanimously adopted by the United Nations upon a motion by the United States.

Under the "norm of international law" at Nuremberg, the individual was not excused for committing crimes against humanity because he acted in accordance with orders from his superior. Both the individual and the Nazi government were guilty. This theme is repeated throughout the film with appropriate variations. The captured pilots are air pirates, mercenaries, and outlaws. They and other U.S. military personnel in Vietnam are committing acts of criminal aggression. Thus, they have no status as prisoners of war, as defined by the Geneva Convention of 1949 to which both the United States and the North Vietnamese governments presumably adhere.

Throughout the questioning and commentary by the East German producers of the film, there is a studied attempt to compare U.S. policy and actions in Vietnam with those of the Nazis in Europe during World War II. Each pilot was asked specifically if he knew of any declaration of war by his government against the Democratic Republic of Vietnam. As Nazis were convicted of crimes against humanity and their convictions were supported by world opinion, so U.S. military personnel are also criminals and not deserving of the status of prisoners of war.

The criminal intent of the individual pilot is established by juxtaposing scenes from his sober interview with scenes of conviviality among U.S. pilots at their air bases and on Navy carriers and scenes of alleged "terror bombing" of civilians in North Vietnam. Complimentary mention is also made in the commentary to the "Russell Court" in Copenhagen as a judgment of world public opinion on the U.S. role in Vietnam.

U.S. pilots are poor officers because they are callous about human life, cowardly when their own lives are at stake, and violate their own Military Code of Conduct when captured.

This theme is closely related to the one alleging criminality and is developed similarly in the film. Again, scenes of bomb damage and wounded women and children are followed by scenes from U.S. television films showing pilots being interviewed after returning to their bases from successful missions over North Vietnam. The pilots in these U.S.-made interviews are posed against a background of highly technical equipment and speak with fitting modesty about their recent success over specific targets. These scenes contrast vividly with those of North Vietnamese women and farmers capturing downed pilots with only pitchforks.

In the prison interviews, the fact is established that these downed pilots had their service revolvers with them at the time of their captures but, contrary to the Military Code of Conduct, had not used them to resist capture. Though brave when dropping bombs and napalm on civilians and heroic when interviewed by the U.S. press, these same pilots are cowardly when face-to-face with their victims and behave contrary to their own regulations when facing capture.

Further elaboration of the theme about the poor quality of U.S. officers is given by the East German commentator who, at the end of each extended interview with a captured pilot, reminds the audience that the Code of Conduct specifies that captured U.S. military personnel are bound to give their captors only their names, ranks, serial numbers, and dates of birth.

U.S. officers are ideologically naive and politically they are dolts.

The role of the pilots in the development of this theme is relatively passive. Each, following the U.S. tradition of political neutrality of members of the Armed Forces, makes a statement disavowing any active interest in politics, domestic or international. From these simple disclaimers, the East German commentator then attempts to reinforce the popular notion among many Europeans, Communists or not, that Americans generally are politically immature. Americans are obviously technologically advanced, but equally obviously they are retarded in their understanding of the real social forces and class struggle throughout the world. To quote from the commentary:

The clumsy and by this time immature impression which captive Americans made with regard to politics may in our opinion hardly be blamed on the individual. It is much more the faithful reflection of the inner political situation in the U.S. of which Professor Robert Paul Wolff says in his essay, "The gap between the ruling and the ruled is so deep that the active participation of the citizen in the affairs of the government disappears into it. Even the periodic election becomes a ritual where the voters choose a president whom they have not appointed so that he decides on facts which were never discussed, on the basis of facts that cannot be published."

This theme is probably the most undisguised propagandistic one of all in the film. It lacks any subtle development that involves U.S. activities in Vietnam. It is exhortative and suggests that the U.S. is unfit to cope

with the governments and peoples in countries that are the beneficiaries of "scientific socialism." The U.S. pilots' disavowals of partisan politics only provide the springboard for a monologue on the political unawareness of American world leadership.

The North Vietnamese exhibit Western (Christian) virtues that the United States only professed

This is an all-pervasive theme. The people of North Vietnam are long-suffering. Their tribulations are American-made and not of their own making. They bear these tribulations with great fortitude and unswerving loyalty to their government that is also blameless since it is not attacking civilians in the United States. Yet when these simple people confront their tormentors—downed U.S. pilots—they act with great restraint and kindness. They see to their enemies' physical needs, offer what medical aid they possess, and steadfastly refrain from taking any personal vengeance against the pilots. This portrayal of the North Vietnamese people as the forgiving victims of an impersonal "American Colossus" is supportive of the contention of the peace movement in the United States and elsewhere. As such, the pictorial elaboration of this theme will be taken as "proof" by groups in this peace movement.

The use of camera close-ups and their editing into what appears to be uninterrupted sequences of this "good guys versus bad guys" theme is quite convincing. The faces of the pilots seem to reflect some inner feelings of guilt, sadness and remorse when they are questioned about their treatment by civilians at the time of their captures. Whether these camera shots were taken at the time the pilots were actually being queried about their captures cannot be determined. Only one pilot voiced some personal remorse at his violation of his religious tenets against killing. But even his response could have been made to a different question than the one that was heard on the sound track of the film.

The United States has broken with its own traditions in fighting a war in Vietnam.

The objective of this theme is to convince the captured pilots and more significantly those in the wider television audience that the Vietnam war is "Johnson's war." Such a war is contrary to America's great traditions. The questions and comments on the response from pilots mention the great historical role of the United States and reverently quote excerpts from the U.S. Constitution and the Declaration of Independence. It is doubtful that this "Devil quoting Scripture" technique has any effect on the captured pilots, but this cannot be asserted with the same confidence about viewers who have taken a peace-at-any-price position and who might be expected to be receptive to appeals to restore "historical America."

The Soviet Union is providing the tangible means for the people of a small "fraternal socialist" country to defend itself against attack from a mighty imperialistic country.

The purpose of this theme seems to be twofold. First, to demonstrate

that the U.S.S.R., as a nation-state, can compete successfully with the U.S.A. not only politically and economically, but also militarily and technologically. Secondly, to show developing nations in Asia and particularly those with Communist-influenced regimes that the Soviet Union is ready, willing, and able to come to their aid with modern and effective weapons.

This theme, unlike the one on the political and ideological shortcomings of Americans, is promulgated by testimony from the U.S. pilots rather than by direct statements of the unseen commentator. Each is asked if he knows how his plane was brought down, and each showed his technical knowledge of weapons by naming a specific type of enemy aircraft or type of rocket that he believed was involved. This U.S. expertise was further exploited by other questions that emphasized that the pilots knew the equipment involved was Soviet-made. In the battle, it was Soviet equipment in the hands of simple Vietnamese that triumphs over U.S. equipment and personnel.

EVALUATIVE COMMENTS

The six major propaganda themes just discussed were abstracted from a film where they are intertwined and submerged under the realism of a documentary-type production. Knowledge and forewarning about these themes can tend to destroy the seeming objectivity of the "documentary approach" of *Pilots in Pajamas* and can alert viewers to see the contrived nature of this television presentation. Many of these viewers and others who may read about the film, however, will still be perplexed at the seeming cooperation of U.S. pilots in such a propaganda effort that not only defames them personally but also the country they are sworn to defend.

Because this perplexity may lead some individuals to form hasty and derogatory conclusions about these pilots and U.S. servicemen in general, certain evaluative observations by the analytic team are in order. Some of these observations are admittedly speculative and must remain so until more information is available about the making of *Pilots in Pajamas*. Yet such observations may serve to bring about a suspension of judgment on the part of otherwise well-intentioned individuals who will inadvertently become victims of the propaganda effort if they form conclusions solely on the basis of what seems to be true at this time.

No hint is given by the producers about the selection of the particular pilots who were interviewed. Although they appear to be voluntary cooperators whose consciences, sense of guilt, or repentance caused them to consent to be interviewed, there is ample experience from similar prisoner interrogation in the past to support the suspicion that none had much, if any, choice in the matter. The producers attempt to avoid any impression of "brainwashing." This, in itself, suggests that less crass forms of psychological pressure may have been involved. One such pressure would be to dangle in front of isolated men the opportunity to

communicate with their families via a television interview to be conducted by an obviously non-North Vietnamese, Western interviewer.

While the eyes and ears of a TV viewer may verify that U.S. pilots submitted to interviews, they can only attest to what was an edited film and sound track. They cannot attest to what may have been said or done in the actual interviews but deleted by expert editing. For example, it was observed that some of the phrases were not in the idiom normally spoken by Americans when responding to the types of questions asked. The technique of substituting answers to questions other than those ostensibly asked is frequently used in film-making for both artistic and humorous effects. To believe one's eyes and ears in the case of a film that was edited by competent technicians of suspect political credentials, is a degree of credulity that is unwarranted in any educated person.

Answers by the pilots to questions about military equipment sound much more important and revealing than they actually are. The admissions about the MIGs, rockets, or AA fire that downed their planes is all ordinary, *ex post facto* information which the enemy already knew. Whatever intelligence interrogation these pilots may have had took place previously and was separate from any questioning shown in the film. The information of seeming military intelligence that was elicited in the film was for propaganda purposes and not intelligence. No assumption on whether these pilots gave intelligence information to the enemy is justified on the basis of this film.

The pilots are in situations for which they have not been adequately trained except for physical survival. Except for some oral instruction on the Code of Conduct, their training and practice have been in electromechanical systems, not social systems. They have been schooled to be operators of highly complex machines and to be leaders of men who have cultural values and ideals similar to their own. They have had little or no training in coping with the stratagems of a skilled dialectician who uses logic based upon assumptions with which they are unfamiliar, and in stressful situations where they are relatively powerless, and leadership rests with someone of a different political orientation. No Air Surgeon would authorize these pilots in their present debilitated physical condition to operate aircraft on which they have been highly trained. This same condition makes them even more incapable to perform mental skills for which they have had neither practical experience nor training.

Lastly, these pilots are not in a "Stalag 17" situation. They are not being detained in any organized prisoner of war camp where they might be able to draw some psychological support from being with other Americans and being permitted occasionally to exercise and communicate with other prisoners. Contrary to the few scenes of several Americans being together while reading, relaxing, and celebrating Christmas together, these pilots and other captive Americans are individually incarcerated, physically dispersed and isolated from each other, and kept incommunicado. Judgments about their behavior, therefore, cannot be based

upon the behavior of other Americans who have been captured in other wars where POWs may have been treated as harshly but differently. In this respect, the actual situation corresponds to the propaganda theme--captured U.S. military personnel are treated as criminals not as prisoners of war.

IMPLICATIONS AND TENTATIVE CONCLUSIONS

The quick analysis that was possible of the film, *Pilots in Pajamas*, yields only a few tentative conclusions but many inferences for possible U.S. policy and actions.

Five conclusions were reached. All conclusions but the first one listed below should be regarded as tentative and subject to verification.

1. The film, as a vehicle of psychological warfare, is admirable. It is a carefully prepared and sophisticated propaganda production. It sets forth a pro-Soviet position without alienating viewers who may be generally sympathetic toward the United States.

2. The film's greatest propaganda impact probably will be upon groups affiliated with peace movements in the United States and Western countries and upon individuals who tend to believe that there is a "credibility gap" in the reporting of news about the war in Vietnam. Its impact probably will be somewhat less upon individuals in Eastern Europe because of their over-exposure and saturation by State-sponsored, political education through public communication media. How effective the film will be with viewers in non-Communist Asian and "neutral" countries, cannot be determined without additional analyses. There is some reason to believe that audiences in Asian countries would find some of the behavior of the Vietnamese "unbelievable."

3. U.S. military personnel in Vietnam, if they view the film, will be relatively unaffected except for anger at the treatment of their comrades and amusement at the portrayal of the North Vietnamese as humane and forgiving. The film probably will have an irritating effect on many present and former officers of the U.S. Armed Forces.

4. The weakest point in the film to Western audiences will be the emphasis placed on the fact that U.S. pilots violated their Code of Conduct by not using their revolvers against civilians to resist capture.

5. The strongest point to Western audiences probably will be the "documentation" that was edited into the film from U.S. news and television sources.

The film, its making and distribution by the German Democratic Republic, has a number of implications for the United States. Some of these implications are set forth below.

1. The film is evidence that "software" as well as "hardware" is being accepted by the Hanoi government from Soviet Bloc nations. The absence of any references to military assistance from Communist China should be noted.

2. None of the identified propaganda themes is entirely new. Their combination in the scenario for this major production, however, strongly suggests a formal coalescing of these themes into a "line" that may be expected to be repeated again and again by front-organizations and hence in the public communication media of both the United States and countries abroad.

3. Any negotiations for a political settlement in Vietnam, including the preliminary talks currently being held in Paris between representatives of the United States and the Hanoi governments, will involve the propaganda themes imbedded in *Pilots in Pajamas*. U.S. representatives should be prepared to cope with these themes.

4. It is possible that the film, in whole or in edited parts, will be offered to U.S. networks and individual television stations in what may appear to be as a straightforward commercial transaction. Similar offers may be expected to be made to TV outlets in Mexico and Cuba. The title of the film may be changed and the entrepreneurship may not be directly identified with East Germany.

5. The portrayal and inferred treatment of captured U.S. military personnel indicate that the Geneva Convention of 1949 is not considered germane by the Hanoi government which subscribed to this Convention in 1957. That there may be even a remote basis for this position, suggests that the United States should examine this Convention for ambiguities and, at the appropriate time, press for clarifying amendments.

6. The Code of Conduct is being used as a psychological weapon against the United States and its military personnel and is not the defensive weapon it was intended to be. Those provisions of this Code that define and limit the behavior of military personnel at times of capture and detention should be reexamined in light of the changing nature of warfare and recent medical and psychological research.

7. The legal justification for the treatment being given captured U.S. military personnel is attributed to actions by the United Nations. For purposes of the record, this attribution should be questioned appropriately by the United States in the United Nations and in other international organizations.

AUDIENCE ANALYSIS

Audience analysis also may be classified as quantitative or qualitative. Much of the output of standard intelligence analysis ¹ can be used in the evaluation of audience attitudes, opinions, emotions, and behavior. For a thorough analysis of the audience of a PSYOP appeal, survey techniques may be highly appropriate. However, in dealing with international political communications, such techniques are frequently infeasible for political reasons.

The first two articles of this section describe the means utilized by Radio Free Europe and Radio Liberty to assess the attitudes and perceptions of their audiences. Quantitative and qualitative techniques are employed.

Both types of analysis require certain capabilities on the part of the analyst. In this connection, the results of a study delineating some of the factors influencing the ability to estimate foreign populations' attitudes are described in an article by Alexander R. Askenasy.

The final selection of this part of Chapter IX is an example of the methodology employed to test hypotheses regarding the audience in communication theories applied to foreign audiences.

NOTES

¹ See Chapter VII of this casebook.

AUDIENCE ANALYSIS AND PUBLIC OPINION RESEARCH— RADIO FREE EUROPE*

BY LORAND B. SZALAY

Effective international communication requires more than accurate translation. People and nations have their own language, interests, concerns, concepts, priorities, and values—their cultural frame of reference. This frame of reference is the critical factor in determining whether a communicator is listened to and accepted. RFE audience analysis attempts to derive information from large samples representing wide cross-sections of the population.

BACKGROUND

Radio Free Europe's audience research has developed as a direct

*Excerpts from "Annex to Audience Analysis and Public Opinion Research—Radio Free Europe," by Lorand B. Szalay, annex to "Radio Free Europe—A Survey and Analysis," by James R. Price, the Library of Congress, Congressional Research Service, March 22, 1972.

response to conditions and situational characteristics which are fairly exceptional in broadcasting. Three of these conditions appear to be especially significant.

a. The broadcasting is directed toward the people of Bulgaria, Czechoslovakia, Hungary, Poland, and Rumania. These distant audiences are not readily accessible because of the strong social and political controls that block most of the common means of feedback: free reporting, public opinion surveys, free political elections. The people of these Central and Eastern European countries live under political systems which maintain a fairly close monopoly over all channels of mass and public communications operated on the basis of Communist ideology.

b. The people of these countries generally feel poorly informed; they express a deep interest in receiving information that is timely and unbiased. Thus, there are large, highly receptive audiences in Eastern Europe, and they are distinguished by certain characteristics which deserve interest.

c. In respect to their frames of reference, beliefs, and opinions, these audiences cannot simply be identified with the ideological blueprints of the governments or official media. Nor can they be treated as if the experiences of the last three decades did not have any influence. Although in many aspirations the people of Eastern Europe are similar to people in the free neighboring countries, they cannot simply be equated. For example, they cannot be compared with Austria, on which public opinion survey data and free election results are readily available.

Thus, Radio Free Europe has as its major audiences people that have specific information needs and whose audience reactions are not directly available to the radio station operating from abroad. This uncommon relationship between the station and its audience presents a situation which is delicate politically, complex and demanding from the angle of the communication task. This situation accounts for certain distinctive characteristics of Radio Free Europe in general and for the role assigned to the audience and public opinion research in particular.

Audience analysis at RFE passed through various stages during the past until recently it reached its present scope and orientation. In its present form the Audience and Public Opinion Research Department (APOR) produces extensive and timely information by interviews. These interviews are conducted on large samples of visitors ($N \geq 1,000$) representing Czech-Slovak, Hungarian, Polish, and Rumanian audiences and also on sizable samples ($N \geq 800$) of Bulgarian audiences. The survey data contain generally three major categories of information: Listenership data, program evaluation, and attitude studies.

Comparable information is generally available to Western broadcasting from a variety of different sources. However, the RFE audience research performs an important pioneering service as the scope of the audience and public opinion research in these five Eastern European countries is modest and the publication of opinion results is selective. In the social and

political field, the validity of the officially released data is frequently questionable.

This explains why the relevance of the RFE research is substantive not only in connection with the immediate use of these data in program planning and evaluation but also in the broader context of introducing and applying social science research to this area. RFE research traces and evaluates social and political trends in the five Communist-controlled Eastern European countries in which objective public opinion research efforts are seriously hampered by political conditions. The resulting information gap on Eastern Europe is accentuated by a similar but still wider information gap—a nearly complete lack of solid social science research data on the Soviet society, on the Soviet citizen—his attitudes, beliefs, opinions, and world outlook.¹

Against this background RFE audience analysis attempts to derive solid, objective information from large audience samples, which represent wide cross-sections of the populations. Based on information and observations personally accumulated in Munich and in Vienna, a few general conclusions may be formulated. To keep the report short, the actual procedures, designs, the technical and professional details, situational problems, and limitations are elaborated in separate appendices.

THE INTERVIEW

In its present form audience analysis conducted by RFE's Audience and Public Opinion Research Division is a most significant undertaking. It represents a large-scale research effort to apply public opinion survey methods in real life situations, which requires a careful adjustment of technical-scientific criteria to given social, political, and psychological conditions. After decades of nearly complete information blackout of valid empirical survey data, at the present level of operation nearly 7,000 Eastern European nationals are interviewed every year. Each national sample (with the exception of Bulgaria) includes over 1,000 cases. The interviews are conducted in various large European cities—Vienna, London, Paris—where Eastern Europeans travel as tourists, visitors, businessmen, or sportsmen.

The fieldwork of interviewing is contracted out by Radio Free Europe to independent national public opinion and market research organizations, which employ interviewers who speak the respective languages. The rules and quotas, as well as the guidelines for the interviewers, are specified by RFE's Audience and Public Opinion Research Department. Radio Free Europe also provides the questionnaire used by the interviewer in the process of the interview. The use of independent local organizations is an especially sound decision on more than one account. First, it makes the outcome of interviews and the research results independent of RFE, which is especially desirable because the results tell a great deal about RFE, its popularity, its impact, and its effectiveness.

Assigning this task to local public opinion research organizations is also

important in that it makes it clear that the research involves open public opinion surveys of the type widely used in all democratic, open societies and therefore has nothing to do with clandestine intelligence work—an accusation frequently voiced by the Communist authorities.

Finally, working independently in different locations and using more than one interviewing organization give ample opportunities for internal control, for testing the internal consistency of the results.

The actual interviewing procedure is described in Appendix 1. This description elaborates on a few technical questions such as the procedure for contacting visitors, their cooperativeness, the frequency with which interviews are refused, and other details which were considered important from the viewpoint of effectiveness of the method and the quality of the results.

REPRESENTATIVENESS OF THE SAMPLES

The quality and information value of public opinion surveys are inseparable from the question of how generalizable are the results and how representative are the samples interviewed. This question of generalizability and representativeness acquires special importance in a situation where the parent population—the audiences at home—cannot be directly surveyed and inferences must be based on subpopulations such as the samples of travelers.

As elaborated in Appendix 2 in more detail, RFE's use of large samples, numerous independent subsamples, and its attempts to reach visitors randomly to reduce the biases of selectivity are all sound measures which help to fight the odds of a complex research task.

The designers of the survey work are unquestionably correct in asserting that developments in Eastern Europe during the last decade have produced certain welcome changes, such as extensive travel to the West and reduced anxiety about expressing personal opinions. The RFE Audience and Public Opinion Research Department is prompt and effective in the use of these changes for better obtaining research of higher quality and generalizable results. Although the optimism and confidence in the representativeness of the samples may not be readily proven merely by the adapted design or research method and some of the statistical assumptions may be questioned, a considerable body of empirical evidence suggests that this confidence in the samples is not unfounded. The research findings show that the samples include not only people from all walks of life but also from a broad and varied spectrum of political opinions (Appendix 2).

SCOPE AND UTILIZATION OF AUDIENCE INFORMATION OBTAINED

The information obtained by the Audience and Public Opinion Research Department covers a wide variety of topics and may be conveniently subdivided into three major problem areas:

1. *Listenership data.* This covers such technical information as listening habits, preferred listening times, wave length, receptivity, and jamming. The data are collected with regard to the technical planning and scheduling of broadcastings.

2. *Program evaluation.* This portion of the survey aims to determine the popularity and use of existing programs. It involves assessing what is liked, what is not liked, why, and what people would like to have more of. These and similar questions produce feedback necessary for timely, audience-oriented programming, which is the aim of every broadcast.

3. *Attitude research and special studies.* These studies deal with diverse socially and politically relevant attitudes, opinions, and images. They constitute fairly extensive survey work focusing on important parameters of public opinions relevant to programming and broadcasting.

The main process of data collection involves the administration of the basic questionnaire which includes questions related to all three problem areas. Each year it is administered to new samples. The questionnaire is also updated yearly: some questions are kept to allow for comparability over time and others are replaced by new ones to reflect more timely concerns.

In addition to these basic questionnaires, some special questionnaires are used to cover unanticipated timely events such as Prague in the spring of 1968 and the Polish uprisings in 1970. Some additional "special studies" are occasionally conducted in order to provide timely audience information: for example, the Eastern European interpretation of some key concepts (socialism, capitalism) using new research techniques such as the Semantic Differential.

The use of audience analysis data within Radio Free Europe is institutionally organized. The various country desks show a general and fairly uniform appreciation of the value of the listenership data. The program evaluation results are received occasionally with mixed feelings. This can be explained by the fact that when evaluation indicates a decline in program popularity, the feedback, while useful and necessary, is not flattering. The attitude data and special studies information is of more recent origin and up to now has been used on a more sporadic basis. I feel this area deserves more special attention (Appendix 3).

Generally, the relationship of the Audience and Public Opinion Research Department and the Country Broadcasting Departments cannot be entirely free from the common problems which naturally arise in those instances when people with different professional frames of reference must work out common solutions. The quantitatively oriented social scientist and the talented country expert charged with heavy responsibilities of daily output of high quality are naturally predisposed to look at the same problem from different angles. In the case of Radio Free Europe, however, there are clear signs of mutual appreciation and recognition of the complementary nature and shared interests of these two roles (Appendix 3).

The scope and results of audience research with its nearly 400 publications are broad and varied, and their discussion would go beyond the scope of the present report. However, some data on the role and image of Radio Free Europe may be of interest at this time of conflicting opinions, when the reactions of Eastern Europeans deserve special attention.

AUDIENCE DATA ON THE ROLE AND IMAGE OF RADIO FREE EUROPE

There are numerous categories of audience data which are informative on the role of Radio Free Europe. Perhaps the most significant are those data which estimate the size of its [listenership]. According to earlier (1967) and more recent findings (1971), about 50% of the populations listen to Radio Free Europe. The figures are somewhat higher for Poles and Rumanians and lower for Hungarians and more recently, for Czechs. In all the Eastern European countries Radio Free Europe was found to be the most listened-to foreign station, preceded only by the local national station. Although these local stations—Radio Budapest for Hungarians, Radio Prague for Czechs—generally show the highest number of listeners, the importance of Radio Free Europe is frequently rated higher than the domestic station in particular contexts, especially on foreign news (Poland, 1971; CSR, 1971).

A trend analysis (#221, #304)* has found a slowly but generally increasing listenership for Czechoslovakia, Hungary, Poland, and Rumania. This trend is occasionally interrupted, as in the case of Czechoslovakia, by strict measures of control and heavy jamming in the post-invasion period (#304), but in the long range they usually prevail. While the figures on listening are high, the additional percentage of those who receive RFE news indirectly by word of mouth is hard to estimate. The censorship of news media and the desire to receive reliable information produce a favorable climate for spreading information by word of mouth. The importance of these private channels in controlled societies has been emphasized by numerous accounts.²

Although Radio Free Europe is right below the domestic station on the level of listening, in respect to such characteristics as reliability, truth value, and timeliness of information, Radio Free Europe is consistently in first place (#292, #292a, #182, #168, #177).

In contrast to the image of domestic broadcasting, which is generally criticized for suppression and distortion of information and described as "biased," "cold," and "obscure," Radio Free Europe is described primarily as "interesting," "skillful," "pleasant," "wide," and "quick" (#283, #284, #287, #288).

This emphasis on reliability and information value is consistent with the main task or function that Eastern European audiences assign to Radio Free Europe. To the question, "What do you consider the most

*See Appendix 5, for listing of RFE publications used.

important tasks of Radio Free Europe?" the most frequently chosen functions were "to inform about events," "to explain. . .," and "to entertain." The ambiguous function of "encouragement," which could simply mean to have faith that the situation will improve, or with more forcefulness might be interpreted to mean encouragement to revolt, figures only as a low choice of 10%. The most frequently given reasons for liking Radio Free Europe by Czech, Hungarian, and Polish listeners were that the programs were "interesting" and "informative" and that it provided information otherwise not available.

* * * * *

APPENDIX 1. THE INTERVIEW

The experience of being questioned by an independent research organization as a part of a public opinion survey is generally an uncommon, novel experience for Eastern Europeans. Questioning about attitudes and opinions related to official, governmental interests, which might have undesirable personal consequences, may be a more commonly shared expectation. Furthermore, Communist authorities are heavily engaged in campaigns to discredit Western public opinion research in general and the polls conducted by Radio Free Europe in particular.

There are numerous indications that during recent years the adverse effects of this preconditioning have considerably decreased, that Eastern Europeans are less hampered by fear, and that they talk more freely. Nonetheless, it would be wrong to entirely dismiss the potential impact of unfamiliarity, anxiety, and various misconceptions of the interview, which could produce biased results.

In respect to the objectivity and information value of the results of RFE audience research interviews, the following steps appeared to be especially critical:

- a. Selection of the interviewee
- b. Contacting the interviewee; his cooperativeness
- c. Interview procedure

To examine the procedure, I questioned about a dozen INTORA (Vienna) interviewers about their work and experiences. I also had the opportunity to observe interviews in progress and to talk with the people interviewed. Based on these various impressions, I have come to the following general conclusions:

a. Selection of the Interviewee

Ideally, the interviewer would interview every traveller he happens to meet on an entirely random basis. These people, by their characteristics as a subsample, would approximate the parent populations (nontravellers in the country). There is naturally a discrepancy between the composition of the samples and the parent populations. In actuality, we know that the samples are not entirely representative, that the more educated strata are over-represented, that peasants are generally underrepresented, and so on.

To help correct his discrepancy, quotas are calculated. The director of INTORA explained that two complementary measures have been developed. One is based on previous experiences with the interviewers, which give an idea about their characteristic preferences, what type of people they are predisposed to contact. Taking these predispositions into consideration, INTORA selects interviewers whose predispositions largely balance each other.

As a second measure INTORA issues guidelines on which category of traveller to focus on—young, less educated, etc. The combination of these two measures was described as generally effective in obtaining sizable, fairly proportionate representation for the expected quotas. As a means of reducing the discrepancy between the composition of the samples interviewed and the parent population, weighting scores are calculated, based on the relationship of the actual proportions of people interviewed and the desirable quota calculated on the basis of the national sample.

A second source of discrepancy may be the result of a more or less conscientious avoidance of the unpleasant experiences of rejection. Especially the more experienced interviewers may be suspected of having developed a certain sense for detecting those who may be cooperative and those who may not. For instance, they may have learned to avoid hardcore party members, secret police, and the like. There are no safe controls against this type of bias. Nonetheless, the breakdown of the samples by occupation and party affiliation suggest that the effects of this selectivity are probably not too serious or that they may be partially cancelled out by conflicting trends (for example, the above average participation of party favorites in foreign travel).

b. Contact and Rejection Rate

Contacting the prospective interviewee is naturally an important and delicate step since Eastern Europeans are not used to polls and have developed considerable suspicions. The adverse effects of these understandable reservations are apparently reduced by the fact that the interviewers are compatriots of the travellers who speak the same language. The interviewers also understand that they must first establish a rapport on the basis of neutral topics (finding places, articles, shopping). Next the interviewer explains his survey and asks for cooperation.

As was stated by both the interviewers and INTORA, the average rate of refusal is about 20%. This rate differs from nation to nation as well as over time. Presently, the rate of refusal is the highest from Czechs and Slovaks (about 35%) while Rumanians were characterized as the most readily communicative (15%). The 20–25% refusal rate is surprisingly low and requires repeated verification.

To maintain control over the work of the interviewers, the Audience and Public Opinion Research Department has set the condition that the interviewers are obliged to call in by phone in 80% of the time. They must state that they have an interview in progress and give the location and a

brief description of the interviewee. These calls are then used for local spot checks.

c. The Interview Procedure

Once he has received an affirmative answer in respect to the interviewee's readiness to cooperate, the interviewer takes the questionnaire and poses one question after another. The interviewer reads from the questionnaire and notes the answers or places the checkmarks in the case of multiple choice items. The interviewee is fully aware that his responses are being registered. Although this procedure could arouse some fears, the fear may be counteracted by certain other factors. Namely, the interviewee recognizes that the nature of this inquiry is schematic and mechanical, and the questions do not convey the idea of searching for personal or confidential information. Furthermore, he has been previously assured that his identity will not be retained and that the evaluation of the information will be group-oriented and statistical.

The questions belong to three major categories: (a) attitudes and opinions on timely social, and political topics, (b) information on listening and program preferences, and (c) data on the respondent's sociodemographic background. Part b, is administered only to respondents who have stated previously that they regularly listen to Radio Free Europe. The administration of the questionnaire requires on the average 40-60 minutes.

The interviewers have stated the interviewees generally have no problem in understanding or answering the questions. Occasionally, they ask for clarification on the use of certain terms such as "socialist party" and express the desire to offer more qualified answers than the forced choice alternatives provide for. There is a general tendency to tell more and elaborate on details beyond the scope of the questionnaire.

The interviewees are not paid for the interview but it is a common practice for the interviewer to offer coffee or beer to the interviewee if the questionnaire is administered in a coffeehouse or restaurant. The interviewers state that the interviewees generally desire to talk and like to have their opinions asked.

The interviewers I met were mostly men; there were only two women in a group of twelve. Both male and female interviewers appeared well qualified and interested in the work. They usually have other full-time occupations and do the interviewing only on part-time basis. They receive about a \$5.00 equivalent in Austrian schillings (135) for each questionnaire.

Since a large portion of the questionnaire deals with RFE performance, the claim that neither the interviewers nor the interviewee know about the source of interest is somewhat doubtful. It is true only in the sense that they are not told this explicitly. The official explanation states that radio stations involved in broadcasting toward their country are being evaluated.

APPENDIX 2. THE SAMPLES

To derive up-to-date information on audience characteristics such as listening habits, program preferences, and attitudes of the people in Czechoslovakia, Poland, Hungary, Rumania, and Bulgaria, travelers (visitors, tourists) arriving in Western European capitals are interviewed.

The institutes listed below are being used to conduct the field work. Not all of them will always work with all five national samples as there may be only a few travelers of a certain nationality in a certain area.

INTORA Opinion Research Institute	Vienna, Austria
A.I.M. Market Research Institute	Copenhagen, Denmark
A.I.M. Market Research Institute	Stockholm, Sweden
William Schlackman Psychological Research	London, England
Sales Research Services	London, England
SOFRES Opinion Research Institute	Paris, France
COFREMCA Opinion Research Institute	Paris, France
Vandoros	Athens, Greece

Since the native populations of these countries cannot be reached by Western surveys, the interviewing of visitors to the West from these otherwise inaccessible populations appears to be the best alternative for obtaining useful, generalizable information. Since the early 1960s travel restrictions have been considerably reduced and now several hundred thousand Eastern Europeans travel to the West every year. While the size of the travelling groups is unquestionably large enough to warrant sampling on a sufficiently broad foundation, the composition of the samples presents a more complex problem.

The ideal objective would be to use samples that precisely match the composition of home audiences in the respective Eastern European countries. However, a more realistic expectation is to approximate the composition of parent populations within acceptable limits, and there are indications that a fairly good approximation is reached. Before elaborating on these data, we should discuss the extent to which we can expect the samples of visitors to be representative of the parent population. Even if they closely approximate each other in the distribution of certain demographic variables (age, sex), this is not necessarily an indication that the visitor sample does not deviate from the parent population on some other parameters—political beliefs, level of politicization, conformity, extroversion. If it does deviate, then this deviation in turn may show significant correlation with attitudes and opinions expressed in the interview. To mention only a single example, let us take mobility. Mobility, the motivation and interest in travel, is not the same for those who travel and those who do not. To what extent mobility, on which travelers and non-travelers differ, actually interferes with the distribution of responses

is in no way clear. If we assume that this mobility correlates with the level of interest in the external world, in international affairs, then it could produce biased results as a factor of selectivity. If this selectivity is assumed to be more political in nature, then its effects on politically oriented questions are likely to be negligible.

Since we cannot clearly identify those factors which actually differentiate those who travel from those who do not, demographic quotas (educational, occupational) provided for sampling may not solve the problem.

Nor is this problem resolved by the method of "independent sampling." The rationale of interviewing independent samples of travelers in various European capitals is undoubtedly sound, and it provides a solid basis for testing the internal consistency of the results. Nonetheless, if there is a selectivity factor which differentiates travelers from non-travelers, the effects of this factor cannot be eliminated by this sampling procedure because in this sense the samples are not independent.

Nonetheless, there are research findings which suggest that the samples have a broad and varied composition which includes not only sizable groups of the main social and educational strata but also sizable percentages of people with diverse political orientations. Table 1 shows the composition of samples on the basis of occupation.

TABLE 1
THE COMPOSITION OF THE 1970 SAMPLE BY OCCUPATION

	Czechoslovakia		Hungary		Poland	
	RFE Sample %	Popula- tion %	RFE Sample %	Popula- tion %	RFE Sample %	Popula- tion %
White Collar Workers	23	29.8	23	27.8	26	27.0
Technocrats	16		12		10	
Professionals	6		6		6	
Artists, Writers	4		4		1	
Students	7		4		12	
Workers	31	59.7	27	46.1	26	42.0
Full-time Housewives	6		9		10	
Shopkeepers	—		4		3	
Others	2		2		2	
Farmers	5	10.5	9	26.1	4	31.0
	N=1499		N=1525		N=1316	

The disparity in categorization complicates direct comparisons. As an RFE publication on the "Occupational Background of the East European Populations" observes:

The statistical yearbooks, published under strictest regime supervision, tend to cover this area in summary fashion and, often, even this summary information is incomplete, or contradictory. Furthermore, employment figures are frequently presented for entire sectors of production (e.g., "transport" or "wood processing

industry") but these figures include everybody from the enterprise managers and chief engineers to unskilled messengers inside the plant and cleaning personnel.

Another problem relates to the semantic ambiguity of certain categories, a confusion probably resulting from both practical and ideological differences. In a Socialist country everybody is a worker by definition. Nonetheless, as a second meaning, worker is frequently used in reference to "manual worker" as in the dichotomy of "workers" and "intelligentsia." In the summary statistics shown above, worker is used apparently in this second sense and the white collar category is largely coterminous with intelligentsia. Where the division line is drawn is impossible to tell.

The demarcation between workers and farmers is perhaps even more ambiguous. Agricultural workers—for example, peasants working on state farms—are frequently categorized as "workers" while peasants doing practically the same work on private or partially collectivized land are identified as farmers.

The "Population" columns of the above table rely on official statistics. The data on CSR came from the statistical yearbook (1970), which contained a table on "the Social Structure of the Czechoslovak Socialist Republic." The Hungarian data are based on a publication of the Bureau of Statistics in a volume entitled "Employment and Income Ratios" (1969 data), which shows the breakdown of the "vocationally active population" (4.46 million).

On Poland RFE has used the information provided by the State Telegraphic Agency (PAP) dated September 29, 1969—as the Statistical Yearbook did not provide this information. Discounting the apparent disparities between the social-occupational categories, the white collar stratum is somewhat overrepresented and the agricultural population underrepresented in the RFE sample.

The comparison between the RFE sample and the parent population is easier in terms of such demographic variables as sex, age, and education, as shown in Table 2. Again, as a general trend, males, middle-aged people, and the more educated strata are somewhat overrepresented in the RFE sample.

TABLE 2
COMPOSITION OF THE 1970 SAMPLE BY SEX, AGE, AND EDUCATION

	Czechoslovakia RFE Sample %	Population %	Hungary RFE Sample %	Population %	Poland RFE Sample %	Population %
<i>Sex</i>

APPENDIX 3. PROGRAM DEVELOPMENT GEARED TO THE AUDIENCE'S FRAME OF REFERENCE

The modern discipline of intercultural communication is based on the realization that effective communication between various people and nations requires more than accurate translation. People and nations not only speak their own language but they have also their own characteristic concerns, priorities, concepts, and values—their cultural frames of reference. This frame of reference is really the critical factor determining whether a communication is listened to, whether it is accepted or rejected, much more so than the language that is the pronunciation of a name or the grammaticalness of a sentence.

As Edward Hall elaborated on this topic at a recent hearing of the Senate Foreign Relations Subcommittee,* effective communication requires more than learning the foreign language; it requires knowledge of the foreign culture. This observation has far-reaching implications for broadcasting to foreign nations. It is obviously not enough to translate programs originally designed for U.S. audiences into the language of a particular foreign audience. Such a translation may be understood word

*Hearings before the Committee on Foreign Relations, United States Senate, Psychological Aspects of Foreign Policy (U.S. Government Printing Office, June, 1969).

by word and sentence by sentence, but this does not mean that it will be grasped in its full meaning or that it will relate to the experiences and interests of the local audiences.

Adjusting programs to the interests of a particular foreign audience constitutes an especially demanding task for which Radio Free Europe, with its national desks, programs, and first class staff recruited from the literary and intellectual elites of the respective countries, has developed outstanding potential.

The institutional policy of Radio Free Europe not only allows for individual country-oriented, independent program development but actually demands it. This unique feature, which is supported by a corresponding organizational structure, differentiates Radio Free Europe from all other known broadcasting stations aiming at foreign audiences. It is probably the main factor responsible for the strong identification Eastern Europeans—Czechs, Hungarians, Poles—develop with the station and is also primarily responsible for its wide popularity.

The audience research has an important role in this performance, even if this role may presently be more potential than actual. In this role the following contributions require special recognition.

First of all, the audience research provides the only empirical evidence which is broadly based and convincing enough to demonstrate that Eastern European audiences do have highly specific audience characteristics—concerns, interests, concepts, images—which differentiate them from other audiences and thus require full recognition and selective communications. For any interested citizen these findings should speak clearly enough to show the necessity of differentiated treatment of selective, audience-adjusted broadcasting.

Secondly, the audience research of Radio Free Europe is an important instrument, which enables the members of the national broadcasting staffs to keep up to date, to preserve the impression of timeliness, and to keep apace with the changes. Whether the staff members are new or old emigrants, they are in danger of getting more and more detached and losing contact with recent changes in the home audiences. Concerns and priorities change, new slogans and concepts develop (e.g., new economic mechanisms), and new social phenomena emerge (hippies). To keep apace with the changes and to update their approach, the broadcasters, script writers, and commentators can safely rely on the findings of audience analysis. To take full advantage of its potential, it is important that audience analysis be treated not as a threatening authority exerting criticism but as an important source of authentic information which can help to adjust to the latest changes and provide a basis for timely decisions not by speculations and arbitrariness but by empirical evidence.

Finally and most importantly, RFE audience analysis has the organizational, material, and personnel resources to provide up-to-date audience information and feedback on approximately 120 million Eastern Europeans—a knowledge presently not available from any other source.

AUDIENCE ANALYSIS AT RADIO LIBERTY*

BY LORAND B. SZALAY

Despite similarities between RL and RFE audiences, there are differences. The Soviet audiences pose special requirements which RL must meet to provide effective audience-adjusted broadcasting. Audience analysis, in such a situation, becomes a most elementary and vital requirement.

* * * * *

SITUATIONAL CHARACTERISTICS, INSTITUTIONAL PHILOSOPHIES

In its background and objectives, Radio Liberty shows some distinct similarities with Radio Free Europe. The similarities are especially important in respect to audience analysis.

First of all, there is no direct physical access to the audiences toward which the station is primarily oriented, and there is little public opinion and feedback information on these main audiences. Moreover, the stations operate in a highly sensitive psychological and political atmosphere. Although little is actually known about the opinions and attitudes¹ of these distant audiences, there are indications that during the last decades

*Excerpts from "Audience Analysis at Radio Liberty," *Congressional Record*—Senate, Vol. 118, No. 33, Washington, D.C., Government Printing Office (March 6, 1972), pp. S 3426-S 3428.

they have developed some characteristics which distinguish them from comparable Western audiences.

Despite the similarities between RL and RFE audiences, there are also some characteristic differences. The differences may have emerged as a function of the longer history of the Soviet Communism and the inbred nature of the Soviet system as compared to the largely imported nature of Eastern European Communist systems. The differences may also have resulted from the greater isolation of the Soviet population compared to the physically, geographically, and psychologically more exposed populations of the Eastern European border states.

For the Soviet audiences there also appears to be a stronger association between nationalism and loyalty to the political system. There are indications that external criticism of the system may be more readily resented on primarily nationalistic grounds. There is a type of national pride in the Soviet world power status, space achievements, and sport successes which is effectively exploited by the political system for denouncing criticism and political opposition as "unpatriotic." The Eastern Europeans, however, do not take pride in Communism as a type of national achievement; rather it is generally viewed as a foreign imposition of Russian colonialism.

It is not only the combination of strong national feelings with ideological elements which complicates the situation; a combination of nationalism and white Russian centralism also produces a hard-to-predict attitudinal mixture, which challenges minority nationalisms that work toward independence and separatism.

All these factors and more contribute to making an especially complex communication task involving audiences with uncommon, occasionally highly ambivalent, feelings and philosophies. Thus, the Soviet audiences pose special requirements which Radio Liberty must meet in order to provide effective, audience-adjusted broadcasting. In such a situation audience analysis becomes a most elementary and vital requirement.

At the same time, as a competent RL representative has expressed, no one in the West seems to have a very clear idea about the actual attitudes and beliefs of the broad Soviet citizenry.² Under these conditions the proper selection and planning of broadcasting, which is large in volume and can rely on little first-hand audience feedback, becomes an immense task.

The situational factors hampering audience analysis are overwhelming. Compared to the Eastern European development, they show only slow and minor improvements. The Soviet attitude of hostility has not mellowed, jamming is in full effect, and the number of travelers (RFE's major information source) has not shown a dramatic increase. Moreover, the campaign of denouncing Radio Liberty and discouraging cooperation with Radio Liberty has recently been further intensified.

Listenership data are naturally very difficult to obtain in a closed society. In view of the Soviet system and the lack of surveys conducted on

samples which would allow broad generalizations, it is impossible to give an empirically founded estimate on the actual proportions of the listenership. Nor is it possible to plot trends in the level of listening over time as Radio Free Europe has been doing for the last decade. Only a few general statements can be made which suggest that Radio Liberty is widely known and listened to.

In a closed society where listening to a foreign station is an officially proscribed activity, statements on listening or nonlistening cannot be accepted without reservation. The impact of the station, however, goes beyond the direct listeners; it also involves those who receive the information by word of mouth. These percentages may run high but are especially hard to estimate. In an open society the proportions of listenership may directly express the popularity of particular stations. In a society of controlled public media, however, where there is an intensive awareness of news censorship, the numerical data on the direct listeners is not sufficient to give a realistic idea of the importance of a station.

Under these conditions Radio Liberty does not feel that the situation is "thawed" to the point that they can provide public opinion research comparable to Radio Free Europe's. At the present time it is considered impossible to conduct open interviews on large visitor samples which could approximate in composition the home audiences. Whether this position is a legitimate one or merely an attitude based on past experiences is a debatable question which will be discussed later.

Nonetheless, Radio Liberty now holds the position that audience analysis, at least for the time being, cannot be conducted on the principles of open public opinion research. It cannot use open, large-scale surveys, first of all, because by doing this Radio Liberty would expose its sources, who as Soviet citizens would be subject to political persecution. Furthermore, Radio Liberty feels that a detailed elaboration of the present procedures is undesirable at least in terms of specifics, which could be exploited and frustrate future efforts of data collection.

Discussed in more general terms, Radio Liberty's audience analysis consists of three types of activities:

- a. Documentation of mail and press reactions.
- b. Panel evaluation of programs.
- c. Reports on interviews with Soviet travelers.

DOCUMENTATION OF MAIL AND PRESS REACTIONS

Especially in the past this category of audience reactions to RL broadcasts has represented a major information source. While the content of the audience mail reveals public sentiments, the flow of this information depends a great deal on the fluctuating level of censorship and suppression of private mail traffic.

The content of this mail is conveyed by RL excerpts. This method is simple and commonsensical but provides little basis for broader generalizations and is not very convincing to the more skeptical. The central

themes of these letters are: complaints about the suppression and distortion of news by the Soviet media, manifestations of desires to be adequately informed about the world, and compliments to Radio Liberty for its interesting and informative broadcasting.

While this content shows little change over time, the flow of these letters has shown a decrease in volume during recent months. Although it might merely be taken as a sign of loss of interest, this simple interpretation would ignore certain facts. Recently the foreign mail has undergone stricter censorship and strong anti-Radio Liberty campaigns have been launched. That the Soviet government has taken an increased interest in Radio Liberty is shown by the . . . yearly breakdown of the volume of media used in attacking Radio Liberty.

PANEL EVALUATION OF RL PROGRAMS

As a partial substitute for first-hand audience feedback, Radio Liberty has developed a panel approach for program evaluation. A fairly sizable panel is formed of recent emigrants, travelers, and Soviet experts. The members of these panels receive samples of the new program items, and they are asked to evaluate them in terms of the effects they might have on Soviet audiences. To facilitate and systematize this evaluation, a variety of specific questions are asked: How interesting is its content? How effective will it be? How is the form of presentation, language, style? Is the program sufficiently supported by facts and data? Should the program be repeatedly used? Does the program appeal to the whole listenership? to the creative intelligentsia? to the scientific-technical intelligentsia? to journalists? to party and ideological leadership? to military, youth, workers, rural populations? The members of the panel evaluate each submitted program element in the above terms. Then the evaluations produced by individual members are summarized and the conclusions are formulated.

Considering the situational constraints, the above panel procedure appears to provide an economical solution. The panel's effectiveness, of course, depends a great deal on the authenticity of its members in their representation of the contemporary Soviet audiences—their concerns, attitudes, language, style, taste, etc.

REPORTS ON INTERVIEWS

To differentiate this method from the RFE's public opinion questions, which are contained in a questionnaire administered in a uniform, schematic procedure called an "interview," Radio Liberty refers to its approach as "conversations." These are also fundamentally interviews, but they differ from RFE's surveys in that they are not organized on the same lines as Western surveys. They try to adapt to each individual informant and tap his personal knowledge and opinions in the framework of one or more conversations. The interviewer is not bound by prepared questions but has a checklist of possible topics. These involve general

listening, foreign radio listening, general accounts of audience reactions, attitudes, opinions, etc. The conversation can be of any length, extend over numerous meetings, and can discuss audience characteristics at any depth. This procedure does not follow the rationale of Western opinion surveys, which attempt to work with representative samples by using a standard, pretested set of uniform questions. Accordingly, RL's evaluation is fundamentally descriptive.

The number of persons interviewed reaches several hundred yearly. Thus, the size of the group is large enough to warrant broader generalizations. The specific composition of these samples, however, represents the more thorny problem.

Radio Liberty's position, as it stands now, is that in order to protect informants, it would be "irresponsible" to place the interview in the public spotlight. As a "Note" by Radio Liberty on this subject states:

The difficulties encountered in conducting survey research work among Soviet citizens are all those obstacles which a totalitarian regime can systematically impose, the most important of which is the denial of free and ready access to interviewees, both within and without the territorial confines of the USSR. Internally, the Soviet Union is a closed society and systematic interviewing of a representative sample of the population is impossible for obvious reasons. This limits Audience Research essentially to interviewing Soviet travelers abroad. Here also free access is denied, however. Travelers abroad are generally briefed to be wary of foreigners or Soviet emigres who attempt to engage them in conversation on substantive issues. Surveillance of Soviet travelers, while not total, is also a common practice. Additionally, fear plays an important role. Radio Liberty and other foreign radios are regularly and systematically attacked by Soviet media in the most inflammatory terms. The virulent hostility of the Soviet regime to foreign radios in general and Radio Liberty in particular is consequently no secret to Soviet citizens and they are often hesitant to discuss listening (which can be interpreted as a political act) with a stranger until good rapport and some degree of confidence can be established, often a time-consuming process. In light of these impediments to normal social research, usual scientific sampling methods are precluded. An adjunct to the above is that the recruitment and training of qualified people to work as field interviewers is no easy task.

As an additional reason for keeping these interviews confidential, Radio Liberty refers to the need to protect the RL interviewer. This attitude of cautious secrecy prevails in the entire procedure from the moment of contact to the use of the results.

In respect to the contact, no claim is made for random choice. To the contrary, those travelers are interviewed who in a careful process of establishing rapport present themselves as cooperative. Areas of conversation or themes about which the interviewee appears hesitant to speak are avoided. The broadcasting divisions receive the report of the conversations in an anonymous form.

The main products that the broadcasting divisions receive are in the form of single listener reports. They describe the interviewee in terms of occupation, nationality, and language. The reports also include such details as place, listening times, language of broadcast, audibility, jamming, and specific programs listened to. In addition to these general, largely technical details, there is a summary of the conversation, which may include statements about public reactions, comments on recent events, and expectations about future developments. In the few reports I have read, there was a recurring complaint about the system's control of news and the general lack of reliable, objective information.

NOTES

¹ Alex Inkeles and Raymond Bauer, *The Soviet Citizen* (Cambridge: Harvard University Press, 1961).

² This opinion is generally supported by the literature. As Inkeles and Bauer point out in their Harvard study on Soviet refugees, "there are many excellent books describing the history of the Soviet Union and the formal structure and functioning of its institutions, but we know almost nothing about the attitudes, values, and experiences of its citizens." *The Soviet Citizen* (Cambridge: Harvard University Press, 1959), p. 3.

IDENTIFICATION WITH NORTH OR SOUTH VIETNAM IN EASTERN EUROPE*

BY RADIO FREE EUROPE

An example of the use of comparative and continual sampling techniques by RFE to assess east European dispositions toward North and South Vietnam.

Interviewing on which this report is based was completed in 1967. Six hundred and seven (607) Polish, 622 Hungarian and 279 Czech and Slovak respondents were polled. Urban residents and those in the higher occupational and educational brackets were overrepresented. The method of COMPARATIVE AND CONTINUAL SAMPLING was employed, and the final analysis was based on those findings which were to a large extent common to the independent samples obtained in seven interviewing areas over a period of 11 months. The interviews were carried out by local opinion research institutes whose interviewers were not identified with Radio Free Europe.

I. WHICH SIDE SHOULD BE SUPPORTED BY YOUR COUNTRY?

Table 1, shows the amount of support North Vietnam and South Vietnam received from the Polish, Hungarian and Czechoslovak samples. The question was formulated so as to neutralize, as much as possible, the fact that the citizens of none of the three countries have, at present, any choice about supporting North Vietnam:

*Excerpts from "Identification With North or South Vietnam in Eastern Europe," Audience and Public Opinion Research Department, Radio Free Europe, April 1968.

Table 1

"Assuming that it had a free hand in the matter, should your country support North Vietnam, South Vietnam or neither?"

	<i>Poles</i> %	<i>Hungarians</i> %	<i>Czechs/Slovaks</i> %
North Vietnam	16	10	5
South Vietnam	18	12	14
Neither	64	74	77
Other answer, no answer	2	4	4
	100%	100%	100%

In spite of strenuous propaganda efforts, the Polish, Hungarian and Czechoslovak governments have not succeeded in evoking a groundswell of sympathy for the North Vietnamese "victims of imperialist aggression." Fully 82% of the Poles, 86% of the Hungarians and 91% of the Czechs/Slovaks polled did not want their country to support North Vietnam.

Support for South Vietnam was slightly stronger. The pro-South Vietnamese minorities in the Polish and Hungarian samples were only marginally larger than the pro-North Vietnamese minorities. However, among the Czechs and Slovaks, South Vietnam was clearly favored over the Communist North: even so, only one in seven respondents from Czechoslovakia wished to see his country become involved on the side of Saigon.

Not to take sides at all was the reaction of two out of three Poles and three out of four Hungarians and Czechs/Slovaks interviewed. To all indications, most Poles, Hungarians and Czechs/Slovaks interviewed are not ready to take sides in the Vietnamese war and desire that their countries should be equally uncommitted in this distant conflict.

II. WHAT KIND OF HELP SHOULD BE GIVEN TO NORTH AND SOUTH VIETNAM?

Humanitarian and material aid were suggested most frequently, while military support was mentioned by only about a quarter of the pro-North Vietnamese minorities. Moral and diplomatic support, which calls for little sacrifice on the giver's part, was suggested mainly by Hungarians:

Table 2

<i>"What kind of help should your country give to North Vietnam?"</i>			
	<i>Poles</i> %	<i>Hungarians</i> %	<i>Czechs/Slovaks</i> %
Medical aid	27	28	50
Food and clothing	19	29	21
Economic, industrial, technical aid	24	18	14
Moral and diplomatic support	11	43	14
Military aid	23	20	29
Other answers	25	17	—
Don't know, no answer	3	5	14
	132%*	160%*	142%*

*Multiple answers

Depite the vast deployment of American aid in South Vietnam, a very large proportion of Czechs and Slovaks, a majority of Poles and nearly half the Hungarians wanted their country to give humanitarian relief and economic aid to South Vietnam. In this respect, East European respondents appear to see both Vietnams in the same light: distant and non-white North and South seem to be associated with disease, poverty and backwardness. In the Hungarian and Polish subsamples, military support was specified by only one respondent in six; the Czechs and Slovaks not only identified more with South Vietnam than with North Vietnam (see Table 1), but they also wanted to help them militarily twice as often as did the Poles and Hungarians.

III. REASONS FOR NOT TAKING SIDES

In Table 1 it was shown that large majorities from Poland, Hungary and Czechoslovakia wanted their country to stay clear of the Vietnam conflict; this desire for non-involvement was based on the following reasons:

Table 3

"Why should your country support neither North Vietnam nor South Vietnam?"			
	Poles	Hungarians	Czechs/Slovaks
We are too poor, too small, have our own worries	38	46	34
They are too far away, none of our business	17	27	15
Nobody should interfere, they should solve their own problems	14	13	34
Would be dangerous, nobody should extend a war	20	3	13
Other answers	15	16	14
No answer	—	3	—
	104%*	108%*	110%*
Number of cases	388	458	215

*Multiple answers

As Table 3 shows, the plurality of Poles and Hungarians—and a large minority of the Czechs and Slovaks—felt that their country lacked the means to influence events in Vietnam. Conceptually related is the view that Vietnam is far away and (hence) of no concern to the respondent's country.

REFERENCE GROUPS, CONGRUITY THEORY AND CROSS/CULTURAL PERSUASION*

By E.S. LORIMOR and S. WATSON DUNN

The findings of this study in the measurement of selected middle-class attitudes in France and Egypt suggest that persuasion messages (such as advertisements) can be transferred across cultures to a greater extent than is generally supposed. It also seems probable that the transferability of messages differs from nation to nation rather than conforming to an exact formula.

* * * * *

One of the many puzzling questions facing international communicators and marketers today is the extent to which they can transfer a successful domestic persuasive or promotional campaign to a different culture. Opinions on the subject range from those which support almost complete transferability [2] to those which maintain that every market is so distinct that marketers will face a host of problems if they attempt to use the same approach abroad as they have in their domestic advertisements [7, 12]. Yet there is little evidence reported to support either argument, nor have the factors which affect international communication ever been clearly identified.

The study that follows provided a test in the field of some hypotheses developed from reference group theory and a consistency model of attitude change.

BACKGROUND OF THE STUDY

Among the many variables influencing the effectiveness of most persuasive communications is the source of the message. This point has been well documented by Hovland, Weiss and many others and need not be discussed here. One of the standards by which the audience appraises the source is the reference group to which that source belongs.

Implicit in the concept of reference group is the notion of an individual deriving values and goals as well as frame of reference from the perspective of the group [4, 17, 19]. Consequently, many kinds of units with great variations in size, composition, and structure may become reference groups [19]. A person's reference group may well contain persons whom he has never seen [18], but it is important that the individuals composing a group bear a psychological relationship to each other [3]. We may therefore think of a given nationality as constituting a group. Such phenomena as jingoism, chauvinism, and wartime solidarity suggest that the citizens of a nation have a psychological relationship to each other. We speak of a nation as sharing a common culture, a concept used by Redfield (cited in 19) to refer to a perspective shared by those in a particular group. On this basis it is proposed that one's nationality group serves as a

*Excerpts from "Reference Groups, Congruity Theory and Cross-Cultural Persuasion," *The Journal of Communication*, XVIII (December 1968), pp. 354-368. Reprinted with the permission of the *Journal of Communication*, copyright holder and the courtesy of the author.

reference group for both self-evaluation and attitude formation, other things being equal. The qualifying phrase recognizes such exceptions as the individual who has learned to loathe himself and his membership group so that it may become a negative reference group (cf. 11) and such facts as that the individual has many reference groups, one of which may have more effect than another in a given situation [17].

One popular approach to the study of attitude change is Congruity Theory [13] where two objects of judgment—*source* and *concept*—and an *assertion* are linked. The assertion (communication) originates with the source and concerns the concept. Both source and concept may be positive, negative, or neutral, and the assertion may be positive (associative) or negative (dissociative). The basic congruity principle holds that changes in evaluation always occur in the direction of increased congruity with the prevailing frame of reference. For example, if a negative source (an habitual Drunk) says something favorable about a positive concept (Fine Wines), the attitude toward fine wines would become less favorable while the drunk would rise in the individual's estimation.

HYPOTHESES

On the basis of reference group and congruity theory, and the findings of the case history research, certain hypotheses were formulated:

1. A persuasive message is more effective when its source is viewed as a member of the recipient's nationality group than when the source is seen as a non-member, other things being equal (nationality of source).

Since the foreign model in one country was the native model in the other, and vice versa, it was predicted that:

2. A persuasive message from a source in a country to which he is native has a reverse effectiveness from one in a country to which he is foreign (between country).

It is a well-known fact that the language of a group reflects its values and interests. Obviously an outsider will not be so aware of these as a member of the group who is thoroughly at home in the language. Therefore, a third predictive hypothesis was:

3. A message composed originally in the language in which it is read is more effective than a message translated idiomatically from another language (translation).

A weakness of Congruity Theory is the failure to allow for the consequence of the intensity of the bond between source and concept (originator and object of the message, respectively). It seems reasonable that the strength of the bond is partially determined by the distance between source and concept.

In the study under discussion, it was assumed that a message directly attributed to a source would be seen as more closely linked to that source than one which merely associated the source with the message without making an explicit attribution. For example, if Carl Sandburg is quoted

about a pen, the message is seen more as *his* than when his face simply appears without comment in a pen advertisement. Closer association of the source with the message should lead to closer association of the source with the object of the message. We would expect that Carl Sandburg would have a stronger association with the pen in the first instance. On the ground that a closer association between source and concept results in a stronger link, it was predicted that:

4. A message which is directly attributed to a *positive* source is more effective than one which is his merely by implication (attribution).

Various studies of communication effects have found that, in general, picture and verbal messages together are more effective than words alone in changing evaluative judgments (e.g., 8). A possible reason is that the pictured source reinforces or creates favorable feeling toward the source by appearing to be a member of the recipient's reference group. On the basis of an extension of congruity theory, combined with reference group theory, it was predicted that:

5. The effect of a persuasive communication is greater when a favorable source is actually portrayed with the message than when no source is portrayed regardless of whether or not the message is verbally attributed to the source (illustration).

To test the hypotheses, designs were formulated with two countries, France and Egypt; three levels of identified sources, one native and two foreign; two levels of attribution, attributed and not attributed; two levels of translation, idiomatic translation and a message composed originally in the language in which it was read; and five products.

SAMPLE

The subjects selected for study were middle- and upper-class, urban French and Egyptians. The two countries differ markedly in their degree of economic development, standard of living, and literacy level, and hence permit a test of the hypotheses under very different conditions. The sample in France was chosen by selecting one section at random from middle- and upper-class sections of Paris. After the blocks were numbered, 20 were selected randomly and 10 interviews done in each for a sample of 200. The interviewers were given no choice in the selection of respondents; however, the sample was stratified for sex and employment. In Egypt, a sample of 200 was selected randomly from a larger sample used in a refrigerator study. The original sample was obtained by listing all households in Cairo and its environs which had a special meter, indicating that they used electricity for purposes other than lighting. This original sample was judged by Egyptian authorities to contain almost all of the middle- and upper-class inhabitants of metropolitan Cairo. The respondents were approximately half male and half female. In both countries, subjects were limited to individuals 18 years of age or older. The income, education, occupation, and possessions of the sample were congruent with a middle- and upper-class population.

TEST MATERIALS

The persuasive messages used in this experiment were five print advertisements which had been run quite successfully in mass-circulated magazines in the United States. All had received high Starch recognition scores and most had produced evidence of high recall and/or sales response. All were full-page advertisements which would be effective in black-and-white, were of conventional advertising format, and depended for their impact on a combination of illustration, headline, and body text.

Headlines and copy were translated by bi-lingual nationals. The second version of each headline and copy was written by professional copywriters from each country who had a copy of the original copy platform (including advertising objective), certain background information on prospective consumers, copies of the illustrations to be used, and instructions to write appropriate heads and copy of a given length for the advertisement.

The original photographs were replicated, using French and Egyptian nationals. Great attention was devoted to making details correct, and each illustration carried as a caption a typically national name plus the nationality. Copy and headlines were attributed through the addition of quotation marks and the selected name plus a few words describing the pictured source. The finished persuasive messages consisted of 20 advertisements about each product for each country. The experimental ads were produced by an electrostatic process which provided a clear black-and-white reproduction.

Care was taken to select five products which were neither culture-bound nor too drastically different from products normally used in the selected countries. None of the products violated obvious taboos in any of the countries, and an attempt was made to avoid using a product which was associated with a particular country. For example, France is known for its perfume, on which grounds a French national might be expected to be a better perfume salesman than, say, a Turk, even to other Turks. Neutral fictitious brand names were assigned to the products in order to avoid ceiling effects and any pre-communication judgment. The judgments as to whether or not the products met the selection criteria were made by consulting communication and advertising experts in the nations to be studied.

Ten subjects in each of twenty conditions were shown one message promoting each brand for a total of 200 in each country. These conditions permitted a test of each of the hypotheses. Various measures of effectiveness were administered individually by trained native interviewers in each country. Special care was taken to avoid interviewer or order bias.

MEASURING INSTRUMENTS

Four measures of advertising effectiveness were used. As a measure of attitude toward the products, seven-step semantic differential scales [14]

were used. There is evidence for both reliability and validity of the evaluative scales used in this way [13], and variations of the method have received increasing use in testing advertising effectiveness (e.g., 10). Care was taken to select panculturally stable scales. Subjects rated each advertised product against 12 scales and against a *would buy-would not buy* continuum. In addition, each subject was asked to describe his corresponding ideal product on the same scales. The semantic differential scales were coded from 1 to 7 with 7 being the most favorable.

After factor analysis, four scales which loaded high and purely on the evaluative factor were selected. For both countries, the scales were good-bad, dirty-clean, effective-ineffective, and agreeable-disagreeable. The scores for these four scales were summed for each individual to give his evaluation factor score; this permitted a range of scores from 4 to 28.

As a second measure of attitude toward the products, evaluation factor scores of the advertised brands, were subtracted from the evaluation factor scores of the corresponding ideal products, theoretically permitting a range of individual scores from -24 to +24. These scores are

hereafter referred to as evaluation-difference scores. The rationale for this measure is that the most effective advertisements would tend to move the individual's product rating closer to his ideal product score than would the less effective messages. Thus, the smaller the score, the more favorable the evaluation.

The willingness-to-buy measure was simply the rating made by the individual on the single *would buy-would not by* scale. This again ranged from 1 to 7, with 7 being the extreme of *would buy*.

For the comprehension measure, the two most important ideas from each advertisement were selected, as rated by six judges. Each was presented in a multiple-choice situation with two other plausible statements about the product, again as suggested by the judges. Thus, there were ten multiple-choice questions with three parts to each. The subject was given zero for an incorrect choice, and one for a correct choice. The answers to the two questions for each product were combined, permitting a possible score of zero, one, or two for each individual for each product.

Table 3
Source-by-Attribution-by Translation Means of Egyptian Evaluation Scores

Model	Attribution Translation	Attributed		Not Attributed	
		Idiomatic	Original	Idiomatic	Original
American		22.30 _{ab}	23.20 _a	23.28 _a	23.84 _a
Arabic		19.52 _b	22.98 _a	24.50 _a	21.84 _{ab}
French		21.98 _{ab}	21.74 _{ab}	21.60 _{ab}	24.60 _a

RESULTS

The data were analyzed using analysis of variance and appropriate subsequent tests [20]. Generally little support was found for the nationality-of-source hypothesis. There were no significant source main effects on the basis of any measure. In the case of French data, there were no interaction effects involving the source.

In the collected data in Egypt, significant interactions of source with other variables occurred in the case of all measures except comprehension. (See Table 2.)

Although there was no easy explanation for the significant differences among means in the case of Egyptian data there seemed to be a tendency for the version featuring Americans in illustrations to be more effective (at least in absolute numbers).

Support for the translation hypothesis was found in the evaluation-difference data in the case of French subjects (Table 1). The mean for idiomatic translation was 3.46 and the mean for original composition 2.12. (The lower the mean, the closer the evaluation is to the "ideal product.") In the case of Egyptian data, there was a translation main effect for the comprehension measure (Table 2) with the original advertisement being more effective than the translated message.

Table 4
Source-by-Translation-by-Product Means of Egyptian Evaluation-Difference Scores

Model	Translation	Product				
		Soft Drink	Toilet Soap	Cigarette	Men's Toiletries	Washing Machine
American	Idiomatic	2.00	3.10	3.70	2.20	2.55
	Original	.95	2.85	1.15	1.85	.85
	Idiomatic	3.85	4.05	1.25	3.35	1.95
Arabic	Original	3.70	1.20	4.05	-.60	2.60
	Idiomatic	5.05	3.55	-1.05	.10	.55
French	Original	2.55	2.90	2.45	1.65	2.00

For the French subjects, a significant interaction of translation with products occurred when comprehension was used as a dependent variable. The original was more effective than translation (in absolute numbers) for four of the five advertisements. There were no other interactions involving the translation variable in the French data.

In the Egyptian data, there were translation interactions for all measures. (See Tables 2 and 6.) There was a tendency for the absolute numbers to suggest more effectiveness for the original composition than for the translated message in the corresponding condition, but the differences were not usually significant.

Hypothesis 4 (attribution) received no support from the French data. For the Egyptian data subjects; there was an attribution main effect only in the evaluation-difference data (Table 2).

Table 5
Translation-by-Product Means for French Comprehension Scores

	Soft Drink	Toilet Soap	Cigarette	Men's Toiletries	Washing Machine
Idiomatic	1.08 _{ac}	.78 _{bcd}	1.00 _{acd}	.67 _{bd}	1.00 _{acd}
Original	1.20 _a	.90 _{acd}	.57 _b	.93 _{acd}	1.12 _a

Note. Means with the same alphabetical subscript are not significantly different from each other at the .05 level by Newman-Keuls test.

Here, the attributed message was less effective than the nonattributed message (means of 2.81 and 1.61 respectively). Attribution interaction effects appeared in all Egyptian data except comprehension (Tables 2, 3, 4). In the evaluation-difference analysis, the attribution condition with the American model and the attribution condition with the Arabic model where each less effective than the corresponding non-attribution condition. However, for the willingness-to-buy and evaluation data, there seemed to be no meaningful pattern involving the two conditions.

For the illustration hypothesis, there were no significant effects in any of the French data nor in the Egyptian data.

The hypothesis regarding reverse effectiveness of native and foreign sources received no definitive support from either the intra-country or between country comparisons. The interaction effects in the between-country analyses again seemed to lack a meaningful pattern. However, the evaluation data appear to indicate that Egyptian subjects were more influenced by all persuasive messages than were the French, regardless of source.

DISCUSSION

The findings suggest that persuasive messages can be transferred across cultures to a greater extent than is generally supposed. With the middle-class audience tested, it seemed to make little difference in effectiveness whether the source was native or foreign, whether the message was attributed or not, or even whether it was illustrated. There may well be a cosmopolitan audience in many countries for whom the nationality of the source is relatively unimportant. Although the data provided some evidence in support of the hypothesis that composition of a message in the language of the expected audience is more effective than translation from a foreign language, tests involving levels of skill are needed to determine the limits of this variable.

A number of possibilities suggest themselves as explanations for the lack of difference among the versions tested. (That it was not due to general lack of response to the messages is apparent from examination of the ratings, most of which are well above neutral.) For example, the predictions from reference group theory would not be applicable if one's nationality group were not really a reference group. However, three different measures suggested that the nationality group did indeed serve as a reference group although not necessarily the most important one in buying.

Another possibility is that reference groups are more likely to influence consumers in choosing among *brands* than classes of products [21]. One study [16] indicates also that national reference groups have more effect in association with some products than with others.

Also, expertise may have influenced the application of reference groups to buying decisions and attitudes toward products. It seems probable that a disliked outsider might, in some cases, be more influential than a liked member of one's reference group in cases where the former was seen as an expert and the latter was not. A foreigner might at times be considered more knowledgeable regarding a foreign product than a native, and hence serve to change the subject's attitude.

Another factor which may have influenced the results is the multiplicity of sources involved in an advertisement—the manufacturer, or agency, and medium in which it appears as well as the pictured or named individual. However, the obviously foreign names of the products featured may have suggested a foreign source, an idea which may have outweighed any effect as a result of the combined effect of various sources. Such an effect could occur in the case of any advertisement, but might have been intensified by the fact that the products in this case were foreign.

Still another possible influence is the level of sophistication of the audience. Reigrotski and Anderson [15], in a study of several European countries, including France, found support for the notion that increasing foreign contact tends to increase favorable opinion about other people and cause one to be more critical of his own people. A study of the lower classes might reveal a different picture from that indicated by this sample.

In agreement with earlier studies [9], the finding that Egyptians were more influenced by persuasive messages than the French subjects supports the idea of national differences in reaction to persuasive messages. The study mentioned actually provided evidence for the independence of the French. This suggests that a knowledge of national characteristics would be of great value to an individual in deciding on message strategy. Further, it seems probable that transferability of messages differs from one nation to another rather than being subject to a hard-and-fast rule.

A possible reason for the general lack of difference between illustration and no-illustration conditions is that most illustrations are designed to attract attention to the message. In cases where the subject is forced to

read, as in this study, the message alone may be equally as effective as the combination.

SUMMARY AND CONCLUSION

Despite the obvious need for further research, this study suggests that advertisements may often be successfully adapted from one culture to another. It further suggests that the models used in successful advertisements need not always belong to the recipient's cultural group. Thus, one of the first research tasks that confronts the aspiring international researcher is to determine the positive and negative national reference groups for the countries that he plans to enter and their relevance to the produce service or idea he is promoting.

This study also suggests that general theories such as reference group and consistency theories, may need refinement and possible modification when applied to cultures other than the one in which they were developed.

ACKNOWLEDGMENT

This study was supported by the Group Psychology Branch, Office of Naval Research, under Contract Nonr 1202 (24), "Study of the Influence of Certain Cultural and Content Variables on the Effectiveness of Persuasive Communications in the International Field."

MEDIA ANALYSIS¹

The basic question for the communications specialist in the process of media analysis is "why?" Why was this channel (medium) of communication used rather than another? Or, why should this channel be used instead of another, and why does one particular medium contribute to the effectiveness of the message more than others? In order to answer the question, "why," it is first necessary to determine what contribution to effect is made by each channel.

The use of quantitative techniques to arrive at conclusions of comparative media effectiveness is demonstrated in the first essay of the section. Survey research methods have also been employed by RFE to measure the effectiveness of radio in communications about Vietnam to East European audiences.² "Effectiveness" in the context of media analysis, however, is really a measure of the range of the medium rather than its inherent advantages in persuasion.

The other essays in the media analysis section are not quantitative in approach. Each evaluates use of a particular channel of communication to various audiences from a qualitative frame of reference.

NOTES

¹ See also "Exploitation of Channels of Communications" in Chapter VIII of this casebook.

² The viability of the technique as it is used by RFE may be assailed by some for using samples that are not "representative" of the audiences as a whole. Clearly, the difficulty of obtaining representativeness is the major impediment in any survey technique. Nevertheless, the methodology itself is particularly valuable in some circumstances. In this connection see the contributions by Lorand B. Szalay in this section and Joseph G. Whelan, "Radio Liberty's Audience Impact and Effectiveness" in the Effects Analysis section of this chapter.

EFFECTIVENESS OF PSYOP MESSAGES:

A FOUNDATION STUDY*

BY ERNEST F. AND EDITH M. BAIRDAIN

The findings of a quantitative research effort to establish the comparative efficacy of various PSYOP media in Vietnam indicate that leaflets and airborne loudspeaker messages were found to be clearly effective. Under conditions prevailing at the time in Vietnam, however, radio was not an effective medium.

Psyop comes in many shapes and sizes—ranging from mini-scale person-to-person up to maxi-scale nation-to-nation. But ultimately, even the most grandly conceived psyop reduces to a communication reaching a target—no communication, no psyop. . . .

REQUIREMENTS FOR EFFECTIVE PSYOP MESSAGES

. . . Leaflets and airborne loudspeaker broadcasts are the media that reach the largest number of enemy troops most often. Supplementary data shows that appeals to rally or surrender are the most frequently used themes in the messages carried by these media. Research under wartime conditions prohibits experimental manipulation and it is necessary to find and work with existing real situations rather than creating them for the researcher's purposes. Therefore, the effectiveness of psyop messages making rally and surrender appeals using leaflets and airborne loudspeakers will be the focus of concern in this section.

SELECTION OF CRITERIA

The first issue in consideration of effectiveness is "what is effectiveness?". A search for answers to this question requires selection of criteria appropriate to the subject being studied (i.e., the phenomenon selected for measurement). In evaluating the effectiveness of rally or surrender appeals, the most demanding criterion is that rally or surrender occurs immediately in response to such an appeal; a less restrictive criterion is that the desired response occurs ultimately rather than immediately. A still less strict criterion is consideration of rallying or surrendering whether or not the action takes place. If any of this family of criteria is met, the message has been effective in some degree.

Being overly strict in specification of criteria also would mean being somewhat unrealistic or impractical in evaluating psyop; there must be some acceptable relationship between effort expended to transmit the messages and the amount of return for the effort. The second issue to be considered in effectiveness, then, is the question of "yield" or productiv-

*Excerpted and adapted with the cooperation of the authors from *Final Technical Report Psychological Operations Studies—Vietnam*, Human Sciences Research, Inc., May 25, 1971. Reprinted with the permission of the Advanced Research Projects Agency, project sponsor.

ity; the basis for selecting criteria for evaluation of this issue appears to be purely a matter of subjective opinion in most cases unless someone can be persuaded to make arbitrary decisions that trade off danger to life against expense in dollars and effort.

For clarity of analysis, interpretation and discussion of the issues of "whether effective" and "how effective" cannot be treated simultaneously.

Unfortunately, separate treatment of the two issues results in tedious, lengthy, and monotonous restatements of the same issues. In what follows the question of "whether effective?" will be treated in detail; the issue of "how effective?" will be treated in more global fashion.

REQUIREMENTS FOR EFFECTIVENESS

In order to focus analysis tightly and sharply on the issue of effectiveness, a sequential set of requirements that must be met for psyop messages to be effective has been postulated and a question which tests whether psyop messages meet each requirement has been formulated. These "requirements," in relation to the section titled "Development of a Science" may be regarded as first attempts at formulating and providing support for "theoretical constructs." The requirements are based on the experience . . . gained from studies in Vietnam during 1966-71 and consultation to psyop-related programs at Fort Bragg, logical analysis of the experiential history of military psyoperations embedded in the psyop manuals, and conclusions from interviews and discussions with more than sixty psyop officers. . . . These requirements for psyop effectiveness and the associated test questions, ordered here in logical sequence are:

Requirement 1. Means of transmission of a psyop message must exist within the span of perception of target audience members.

Question: What media enable communication to enemy personnel?

Requirement 2. The message carried by the proximate media must come to the attention of members of the target audience, voluntarily or involuntarily, directly or by relay.

Question: Are messages actually received by enemy personnel?

Requirement 3. The words and phrasing—the language of the message—must be understandable to the target audience.

Question: Are the words and phrasing of the psyop messages understandable with normal ease?

Requirement 4. The theme or content of the message (with some specific exceptions) must be judged by members of the target audience to be comprehensible.

Question: Is the content of the message—the theme—comprehensible to the enemy?

Requirement 5. The content must be sufficiently believable for the target audience to ascribe some degree of credibility to the message.

Question: Are the messages judged by the enemy to be credible?

Requirement 6. The persuasive power of the message in the context of the situation in which it is received by the target audience must not be disproportionate to the danger and potential consequences involved in taking the action recommended in the message. To be effective the recommended action or an equivalent action must be taken or receive some degree of consideration.

- a. Were the psyop messages the dominant factor or a major contributing factor in evocation of the desired action (or an equivalent action)?*
- b. Were the psyop messages a facilitating factor in the decision to take the recommended action (or an equivalent action)?
- c. Did the psyop messages receive serious consideration (whether or not the action or an equivalent action is ever taken)?
- d. Did the psyop messages receive brief consideration even though it may have been quickly rejected?

SOURCE OF RESEARCH DATA/PROCEDURE

The data treated in this section includes the responses of 100 VC PW's and 200 NVA PW's interviewed in all four military regions in Vietnam in 1970. Specially-designed questionnaires were developed for each type of prisoner.

Also included are the responses of 100 NVA ralliers and 100 VC ralliers who were interviewed at the National Chieu Hoi Center in Saigon and other Chieu Hoi Centers in MR2 and MR3 between July and November 1970. . . . Interviews averaged approximately three and one-half hours for PW's and slightly over two and one-half hours for ralliers. . . .

TEST OF RESEARCH RESULTS AGAINST REQUIREMENTS FOR EFFECTIVENESS

The test question for each requirement for media effectiveness is applied in sequence to the research data obtained on VC and NVA ralliers and PW's.

Requirement 1: What Media Enable Communication to Enemy Personnel?

Even a perfectly conceived psyop could not possibly have any effect upon the members of a target audience unless the media is effective in terms of reaching the target audience.

Table 1 shows the extent to which the physical means of emitting a psyop message were within the span of perception of members of the target audience. The proximity of nine types of media—leaflets, airborne loudspeakers, radio sets, newspapers, magazines, ground loudspeakers, posters, television sets, and psyop novelty items was surveyed for four classes of enemy: NVA Hoi Chanh, VC Hoi Chanh, NVA PW's and VC PW's.

*A requirement that psyop be judged the "sole factor" would be extremely unrealistic and incorrect; a basic tenet of clinical psychology is "multiple causation": paraphrased, the rule says; "Every bit of behavior has many causes."

TABLE 1
ENEMY PROXIMITY TO MEANS FOR TRANSMITTING PSYOP MESSAGES

Media	Ralliers		Prisoners	
	VC (100)	NVA (100)	VC (100)	NVA (200)
Saw Leaflets	99%	96%	87%	89%
Heard Airborne Loudspeakers	100%	88%	81%	70%
Saw Radio Sets	98%	69%	98%	68%
Saw Newspapers	34%	16%	20%	11%
Saw Magazines	13%	06%	10%	05%
Heard Ground Loudspeakers	09%	05%	04%	01%
Read Posters	07%	02%	03%	—
Saw Television Sets	04%	02%	07%	02%
Saw Psyop Novelty Items	01%	02%	—	—

Comment. The results shown in Table 1 demonstrate conclusively that leaflets, airborne loudspeakers, and radio are the mechanical means for transmission of psyop messages which are seen or heard by a large majority of VC and NVA personnel. Accordingly, these three media will be the focus of further attention. Statistics for other media will be shown where available but without comment.

Three media are effective means for attempts to reach enemy personnel with psyop messages (under current practices in Vietnam).

Requirement 2: Are Messages Actually Received by Enemy Personnel?

Physical proximity—i.e., being within sight or hearing—of means of transmission of psyop messages does not necessarily mean that messages reach the enemy. Leaflets can be left untouched, the sound of airborne loudspeakers can be audible but unintelligible, and radios may not be in

TABLE 2
MESSAGES THAT REACH LARGE NUMBERS OF VC AND NVA PERSONNEL

who "Heard Radio"				

operation or may be tuned to non-psyop channels. To have the chance to be effective, it is necessary that the target audience attend, voluntarily or involuntarily, to the psyop message.

Table 2 shows the extent to which messages carried by the three effective media register upon the four categories of enemy being treated.

Comment. The results shown in Table 2 make it clear that a very large majority of ralliers—both VC and NVA—did read leaflets before they rallied.

Although all of the samples of NVA and VC ralliers and prisoners had similar exposure to leaflets, there is a large difference in the number of ralliers that read leaflets and the number of prisoners that did so. The number of VC ralliers who read leaflets (86%) is three times as large as the number of VC PW's who read them (27%); similarly, the number of NVA ralliers who had read leaflets (93%) is two and one-third times the number of NVA PW's who had read them (39%).

The differences in leaflet-reading behavior between ralliers and prisoners were investigated by analysis of narrative responses. Those in the PW samples mention their cadres' insistence that it is strictly forbidden to read leaflets and the existence of strict surveillance and controls as reasons for not picking up and reading leaflets. Other reasons mentioned consistently explain that such an act would be disloyal or unthinkable. In contrast, the ralliers do also mention surveillance but a much larger percentage indicate that it is possible to escape such controls if it is so desired; many have some type of grievance. The contrast in attitudes between the ralliers and PW's suggests the existence of personality, ideological, and motivational differences between the two groups. This notion is furthered by the fact that the pattern of the responses of both ralliers and PW's is much more alike than is the pattern of VC ralliers compared to VC PW's or NVA ralliers, compared to NVA PW's.

A large majority of ralliers and prisoners heard the sound of airborne loudspeakers. For the ralliers, to hear the sound was essentially equivalent to hearing the message clearly although not necessarily on all occasions. Among the prisoners, a somewhat smaller percentage heard and a smaller percentage heard clearly on fewer occasions. The option to ignore a leaflet is easily exercised but the same option does not exist in the case of airborne loudspeaker broadcasts; because there is little or no choice about hearing or not hearing such messages, the findings must be interpreted with caution.

About half of the rallier samples—somewhat more VC than NVA—heard radio broadcasts and slightly less than one-fifth of the PW samples heard radio broadcasts. The questions used as internal checks on the consistency of individual responses disclose that in each sample a large majority of those who do listen to radio broadcasts listen solely or mainly to music, opera, or “news”, all of which apparently have little relevance to psyop appeals. The relationship of “news” to psyop could not be determined within the limits of this study.

In summary, of the three media that reach the enemy in sufficiently large numbers to enable execution of studies, leaflets were clearly effective in getting messages to virtually all enemy personnel who become ralliers but were read by only about one-third of the prisoner samples.

Airborne loudspeakers did not reach enemy personnel with the same completeness of coverage as did leaflets although they do reach a larger percentage than any other media.

Radio broadcasts could reach useful segments of the enemy audience but, because the content of what is heard is ambiguous, radio is not identified here as an effective medium for psyop under current conditions in Vietnam.

Requirement 3: Are the Words and Phrasing of the PSYOP Messages Understandable with Normal Ease?

Once the psyop message has reached its target, as a minimum requirement the words, phrases, and style of composition must be characterized by normal intelligibility for communication to occur. Table 3 shows the pattern of reactions to the language used in leaflet messages.

The issue of "hearing words clearly" is so intricately involved with the issue of "understanding words" in a verbal message that the distinction could not be maintained satisfactorily; in effect, the terms appear to be interchangeable. Therefore, airborne loudspeaker messages were not included in this series of questions because of their known brevity and simplistic construction in order to conserve time and expand coverage of indeterminate issues.

Comment. Table 3 shows clearly that the language element of the message is almost completely effective in that no problems are indicated in understanding the individual words.

Requirement 4: Is the Intent of the Message—The Theme—Comprehensible?

It is quite possible to understand all of the words that make up a message without gaining any understanding of the intended content or theme of a message.

For the psyop message to have the chance to be effective, the target audience must feel that they understand the message. Despite this fact, the psyoperator's actual intention, which may be quite different from the "intent" perceived by the target audience—and which is presumably

TABLE 3
INTELLIGIBILITY OF LANGUAGE USED IN LEAFLET MESSAGES

Media	Ralliers		Prisoners	
	VC (100)	NVA (100)	VC (100)	NVA (200)
<i>Leaflets</i>				
% in Sample Read Leaflets	86%	93%	27%	39%
% in Sample Understand Words	79%	93%	26%	35%
% who "Read Leaflets"	92%	100%	96%	90%
who "Understand Words"				

embedded in the content of the message—does not have to be recognized consciously or understood by the target audience for the message to have a chance to be effective. It can be said with confidence that conscious understanding is not necessary for effectiveness because what is known of dynamic psychology makes it clear that one does not necessarily know whether, when, how, or by what, one's thinking and emotions may be affected. Therefore, it is theoretically possible that artfully contrived messages with hidden meanings could influence the readers' attitudes and emotions in some significant way that the reader does not consciously recognize. However, the nature of current operating practices in the field that govern the composition of psyop messages does not encourage the notion that sophisticated messages with hidden intent and impact are the rule—or that they occur at all by deliberate intent.

Instances where the psyoperator's intent is to cause confusion or perplex others may seem to be an exception to the need for an assumption of understanding on the part of the target audience but it is not actually so. The psyoperator's intent is for the reader to become confused about the issue treated in the message; except in unusual circumstances, it is not intended that the reader be confused about the meaning of the message.

Table 4 shows the extent to which target audiences report they have understood the intent or themes of psyop messages.

Comment. The category "Understand Some" is interpretable in two ways: analysis of narrative elaboration of the respondent's initial answers disclosed that the "Understand Some" response may be interpreted correctly as, "understood some part or all of all messages received" or "understood some part of some of the messages received".

It is obvious by inspection of Table 4 that when messages were read or heard, the recipients felt they understood part or all of some or all of the messages received.

TABLE 4
UNDERSTANDING OF THEME—INTENT OF MESSAGES
THAT REACH ENEMY PERSONNEL

Media	Ralliers		Prisoners	
	VC (100)	NVA (100)	VC (100)	NVA (200)
<i>Leaflet</i>				
% in Sample Understand Words	79%	93%	26%	35%
% in Sample Understand Some/All Content	79%	93%	26%	35%
% of "Understand Words" who "Understand Content"	100%	100%	100%	100%
<i>Airborne Loudspeaker</i>				
% in Sample Heard Words Clearly	89%	86%	63%	57%
% in Sample Understand Some/All Content	87%	84%	56%	52%
% of Heard Clearly" who "Understand Content"	98%	98%	89%	91%

In summary, leaflet messages and airborne loudspeaker broadcasts were effective in the sense that those who read or heard the messages judged that they understood the theme or content of the message.

Requirement 5: Are the Messages Judged by the Enemy to be Credible?

Having reached a target audience—to have an opportunity to be effective, i.e., evoke a desired reaction—the content or theme of the message must be judged to be believable. The credibility of a message does not have to bear any relationship to its “truth” or degree of “untruth” as judged by some set of arbitrary standards. “Believability,” or the willingness to ascribe credibility, exists in the mind of each individual recipient of a message.

Table 5 shows the judgments of believability of messages made by the four types of enemy samples.

Comment. As is the case for the data shown in Table 4, the category “Believed Some” is interpretable in two ways: qualitative elaboration of the respondent’s initial answers disclosed that the “Believed Some” response may be interpreted correctly as “believed some part or all of all messages received” or “believed some part of some of the messages received”.

It can be seen by inspection of Table 5 that more than three-quarters of all the rallier samples ascribe some degree of credibility to some or all of the messages received through either media. When only those who read or heard and understood the messages are considered, about nine out of ten ralliers—whether VC or NVA—ascribed some degree of credibility to the messages. Remembering that the average number of leaflets read by the rallier samples is about twenty, it can be said that “the rallier who reads leaflets came to believe them.” About one-fifth of the prisoner samples found some of the messages credible in some degree. Airborne loudspeaker messages were heard and believed in some degree by a large percentage of the ralliers sampled and by about one-fifth of the PW samples.

TABLE 5
CREDIBILITY ASCRIBED TO MESSAGES THAT REACH ENEMY PERSONNEL

Media	Ralliers		Prisoners	
	VC (100)	NVA (100)	VC (100)	NVA (200)
<i>Leaflet</i>				
% in Sample Understand Content	79%	93%	26%	35%
% in Sample Believed Some/All	79%	83%	14%	25%
% of “Understand Content” who “Believed Message”	100%	89%	54%	71%
<i>Airborne Loudspeaker (ALS)</i>				
% in Sample Understand Content	87%	84%	56%	52%
% in Sample Believed Some/All	86%	76%	22%	28%
% of “Understand Content” who “Believed Message”	99%	90%	39%	54%

In summary, leaflets were effective in the sense that almost all in the VC and NVA samples who did rally, and had read or heard and understood messages, believed some or all of what was said in some or all of the messages. About one-fifth of the PW samples ascribed some degree of credibility to messages read or heard.

Requirement 6a: Were the PSYOP Messages a Dominant Factor or a Major Contributing Factor in Evaluation of the Desired Action (or an Equivalent Action)?

Requirement 6b: Were the PSYOP Messages a Facilitating Factor in the Decision to Take the Recommended Action (or an Equivalent Action)?

Requirement 6c: Did the PSYOP Messages Receive Serious Consideration (whether or Not the Action or an Equivalent Action is Ever Taken)?

Requirement 6d: Did the PSYOP Messages Receive Brief Consideration Even Though it May Have Been Quickly Rejected?

Messages may be believed—may be ascribed any degree of credibility—without being “effective” in the sense that “belief” in the message results in any behavior that the message is intended to evoke. A recognized problem that has hindered attempts to “measure PSYOP effectiveness” in the past has been the pervasive tendency to either omit definition of objectives for messages or to cast objectives in terms of what the sender wants to do instead of specifying what the sender wants the recipient of the message to do. Although the distinction may not seem obvious, it is of extreme importance.

Effectiveness, in the context of this study, can be defined only in terms of the objective(s) that the message is intended to serve. A hierarchy of progressively more demanding objectives can be conjectured to exist for most rally messages whether or not they are defined by the originators; stated in terms of effectiveness, these objectives are:

- Cause no negative/counterproductive reaction
- Cause awareness of the possibility of rallying
- Cause consideration of whether or not to rally
- Cause a desire to rally (whether or not acted upon)
- Cause a rally

Whether or not a message can cause any of these behaviors is dependent upon the persuasive power of the message and the individual's total life history up to the point of reading the message and for some period of time afterward.

The total patterns of responses of the VC and NVA ralliers demonstrated that leaflets, far more than airborne loudspeaker messages, were effective in that they had contributed to the decisions and acts of ralliers. Unfortunately, the length of the interviews—which were designed to serve several different objectives and which were held to a maximum of four hours because of limitations imposed by POW Camp and Chieu Hoi Center regulations and schedules—did not permit intensive inquiry into the reasoning processes and emotional reactions associated with rallying.

The total patterns of responses of the VC and NVA prisoners indicated that a considerable number of prisoners, influenced to some extent by leaflet messages, may have surrendered or engineered their own capture deliberately as a way of surrendering that had less potential for future reprisal by their own side.

Once it was established that PSYOP messages were affecting decisions to rally or surrender, the reasoning processes and emotions that were experienced prior to rallying or to giving some degree of "cooperation" when becoming a prisoner—in other words, the "how" and "why" of deciding to rally or facilitate capture—increased greatly in importance. Despite the significance of this issue, contractual limitations on time and effort made it impossible to conduct a further study of both ralliers and prisoners; accordingly, NVA and VC ralliers were selected for a more intensive examination of motivation to rally.

An additional questionnaire and interviewing procedures were designed specifically for more penetrating investigation of the amount and nature of the influence actually exerted by the leaflet messages upon VC and NVA ralliers. One portion of the comprehensive interviewing procedure used with these samples was designed to identify the extent to which the PSYOP messages affected the enemy soldier's thinking and behavior, specifically in relation to defection. Another portion is designed to identify the ways in which the action of rallying first enters an individual's thoughts, the reasoning processes and emotional linkages involved in coming to accept rallying as a possible action, and the reasons for making and acting on a decision to rally. Narrative elaboration of responses was obtained to provide a check on the validity and reliability of initial brief answers. These responses provide useful descriptive detail and, if necessary, can be subjected to latent structure analysis to resolve inconsistencies.*

Arrangements were made for interviews to be conducted at the National Chieu Hoi Center in Saigon, at the Chieu Hoi Center in Bien Hoa, and at several other province centers by a trained all-Vietnamese team of interviewers under the supervision of a Vietnamese Research Supervisor and an American Research Supervisor. Individuals were selected at random from administrative records and assigned to the appropriate category until samples of 100 VC and 100 NVA ralliers had been obtained with the combat: support ratio matched to that of the earlier groups of ralliers. Interviews required from one and one-quarter to one and one-half hours; each was conducted under adequate conditions for privacy and freedom of response.

Table 6 shows the percentages of the two samples of VC and NVA ralliers who had read leaflets, claimed to remember particular types of

*Latent structure analysis is a method used in the social sciences for scaling replies to questionnaires based on the assumption that contradictory or partially inconsistent replies can be explained in terms of the "latent class" or "latent distance" found in deeper underlying attitudes; the logic of the analysis resembles that of factor analysis (Lazarsfeld, 1954).

TABLE 6
ATTENTION TO PSYOP LEAFLETS

Question	First Sample		Second Sample	
	NVA	VC	NVA	VC
Read leaflets before rallying	93%	86%	89%	87%
Remember particular types of messages	87%	85%	89%	87%
Describe message content	87%	85%	89%	87%

leaflets, and could validate this report to a considerable extent by accurate recollection of themes or wording.

Comment. It is obvious by inspection that the statistics approach being identical. [sic]

Table 7 shows four different attitudes toward rallying that existed prior to the reading of PSYOP messages and the effects associated with having read the leaflets. An average of approximately twenty leaflets had been read before rallying; a large majority of the leaflets concerned rallying.

TABLE 7
EFFECT OF PSYOP MESSAGES ON DECISIONS ABOUT RALLYING

Attitude toward defection before reading leaflets	NVA (100)		VC (100)	
	Leaflets played part in decision to rally	Would not have rallied if had not read leaflets	Leaflets played part in decision to rally	Would not have rallied if had not read leaflets
	(Col. 1)*	(Col. 2)*	(Col. 1)*	(Col. 2)*
<i>"No Prior Consideration"</i>				
Did not consider defection before reading leaflets	37%**	(32%)**	26%	(21%)
<i>"Considering Other Method"</i>				
Considering another means of defection before reading leaflets	06%	(03%)	19%	(03%)
<i>"Undecided Re Method"</i>				
Undecided about how to defect before reading leaflets	18%	(07%)	15%	(03%)
<i>"Already Considering Rally"</i>				
Wanted to rally even before reading leaflets	11%	(05%)	20%	(03%)
<i>All Others</i>				
	28%		20%	
	100%	(47%)	100%	(30%)

*Col. 2 is included in Col. 1.

**For example: Among the 37 ralliers who did not consider defection before reading leaflets, 32% would not have rallied if they had not read the leaflets.

Comment. The results in Table 7 show that 37 individuals in the NVA sample had not considered defection before reading GVN leaflets: among these 37, 32 would not have rallied if they had not read the leaflets. For the VC, the equivalent figures are 26% and 21%.

Of 6 NVA who were already considering some other form of defection prior to reading GVN leaflets, 3 would not have rallied if they had not read the leaflets. For the VC, the equivalent figures are 19% and 3%.

Among the 18 NVA who were undecided about a way in which to defect before reading GVN leaflets, 7 would not have rallied if they had not read leaflets. For the VC, the corresponding figures are 15% and 3%.

For the 11 NVA who already wanted to rally before having read GVN rally leaflets, 5 would not actually have rallied if they had not read leaflets. For the VC, the corresponding figures are 20% and 3%.

In summary, 47% of the NVA and 30% of the VC ralliers would not have rallied if they had not read GVN rally leaflets.

Table 8 shows the four gross groups treated in Table 7 (defined by attitude towards rallying before they read rally leaflets), broken down further into seven sub-groups and rearranged to show their relationship to the graded criteria for effectiveness described in Requirements 6a, 6b, 6c, and 6d.

Comment. The results in Table 8 show that the "No Prior Consideration/Would Not Have Defected" group—32% of the NVA ralliers and 21% of the VC ralliers—had not considered any form of defection prior to receiving PSYOP messages and judged that they would not have rallied if the messages had not been received. This pattern of reaction to the PSYOP message indicates the leaflets to have been a dominant factor in the act of rallying. This group, then, meets the requirements for PSYOP message effectiveness described in 6a.

Fifteen percent of NVA soldiers and 9% of VC soldiers (the total of those in the "Considered Other Method/Would Not Have Defected", "Undecided About Method/Would Not Have Defected", and "Already Considering Rally/Would Not Have Defected" sub-groups) had already been considering either a specific method of defection (not rally) or several alternative methods of defection (one of which might be rallying) or were already considering rallying before they read rally leaflets; these individuals reported that they would not have rallied if they had not read rally leaflets. This pattern of reaction to PSYOP messages indicates the leaflets to have been a major contributing factor in the decision to defect by means of rallying. This group, then, also meets the requirements for effectiveness described in 6a.

Nineteen percent of the NVA and 33% of the VC (the total of those in the "Considering Other Method/Would Have Defected in Some Way", "Undecided About Method/Would Have Defected in Some Way", and "No Prior Thought/Would Have Defected in Some Way" sub-groups) would have defected in some manner but had not decided upon rallying. For the 5 NVA and 5 VC in the "No Prior Thought/Would Have De-

TABLE 8
EFFECTS OF HAVING READ RALLY LEAFLETS: EFFECTIVENESS CRITERIA

Effectiveness Requirement	Before Reading Leaflets	Attitude toward Defection	After Reading Leaflets	NVA (100)	VC (100)
Dominant Factor (6a)	No prior thought of defection	Would not have defected	Rallied	32%	21%
Major Factor (6a)	Considering other method to defect	Would not have defected	Chose to Rally	03%	03%
Major Factor (6a)	Undecided about method to defect	Would not have defected	Chose to Rally	07%	03%
Major Factor (6a)	Already considering rally	Would not have rallied	Did Rally	05%	03%
Facilitating Factor (6b)	Considering other method to defect	Would have defected in some way	Chose to Rally	03%	16%
Facilitating Factor (6b)	Undecided about method to defect	Would have defected in some way	Chose to Rally	11%	12%
Facilitating Factor (6b)	No prior thought of defection	Would have defected in some way	Chose to Rally	05%	05%
6a, 6b	Total: Leaflets Contributed to Decision to Rally -----			66%	63%
6c, 6d	Total: Would Have Rallied Even if Had Not Read Leaflets --			06%	17%
6d	Total: Rally Decision Not Affected by Leaflets -----			15%	09%
--	Total: Did Not Read Leaflets-----			13%	11%
				100%	100%

fectured" sub-group, reading rally leaflets was a facilitating factor in their choice of rallying as a means of defection. For the 11 NVA and 12 VC in the "Undecided About Method/Would Have Defected" sub-group, reading rally leaflets tipped the scales toward rallying. This pattern of reaction to PSYOP messages indicates that the leaflets had a facilitating role in the final decisive act of rallying in that the leaflets caused rallying to be chosen rather than some other form of defection. These three sub-groups, then, meet the requirements for effectiveness described in 6b.

Below the double lines in Table 8 are shown the totals for the seven sub-groups of the NVA and VC samples that have been discussed so far; the totals are 66% and 63% respectively.

Immediately below the totals, the number appears of those in the "Already Considering Rally/Would Have Rallied Without Reading Leaflets" who would have rallied even if they had not read rally leaflets—6 NVA and 17 VC. Analysis of their narrative responses, which provides qualitative elaboration in the form of reasons for most answers, indicates that a majority of both groups had prior information about the Chieu Hoi Program from relatives, friends, or other sources; the sources may or may not have been motivated by PSYOP programs given such names as "Induce VC Kin to Rally". In overall context it appears certain that the leaflets, though not a determining factor, were read with some

TABLE 9
THEMES OF INFLUENTIAL LEAFLET MESSAGES

Leaflet Theme	VC	NVA
	(100)	(100)
Family Sentiment	17%	10%
Death	15%	16%
GVN Welcome	08%	12%
Hardship	06%	---
Chance for New Life	04%	---
Useless Sacrifice in NLF	04%	---
Other	02%	12%
TOTAL	56%	50%

degree of serious attention. This group meets the requirements for effectiveness described in 6c and 6d.

A total of 15 NVA and 9 VC read rally leaflets but do not consider that the leaflets contributed to their rallying. While the simple act of reading a leaflet can be ascribed with equal justification to curiosity or boredom, as well as interest in gaining information, these individuals had read the leaflets thoroughly enough and often enough to remember specific kinds of leaflets and to recall message content. The responses of this sub-group clearly meet the requirements for effectiveness described in Requirement 6d.

In summary, PSYOP leaflet messages are effective in that approximately two-thirds of large samples of NVA and VC ralliers believe that the leaflet messages played a part in their decision to rally.

Effective Themes in Influential Messages.

Although those who read leaflets had read an average of about twenty and could recall a variety of themes, 56% of the VC soldiers and 50% of the NVA soldiers, or 53% of the total sample, said that a specific leaflet message had contributed to their decision to rally. The themes most frequently cited as specifically influential are shown in Table 9.

Nearly one-third had a leaflet with them when they rallied, 19% of the VC and 37% of the NVA. The primary reason given for not rallying sooner was the constant surveillance; the next most frequently cited reason was the fact that they had not yet come to believe what the leaflets said.

The Rally Decision Process

The process of reaching and acting on a decision to rally was probed with a structured series of questions about attitudes that existed when the term "Chieu Hoi" was first heard, at the time of actual rally, and at various times after rally.

Knowledge of the Chieu Hoi Program and arrival at some degree of confidence that the GVN will act in accordance with the policies it proclaims emerge as the primary factors in the constellation of developing

attitudes that eventually lead to rally. Motivation is two-factored: there can be motivation to leave the NLF and there can be motivation to join the GVN; the two motivations are separate and do not necessarily appear together. The two factors work together to move the individual in one direction; while the factor impelling the individual away from the Front ranks is fear and distrust, the factor impelling him to rally is some measure of hope and trust. In 200 responses, 200 different situations may be described at a "total detail" level of analysis. But overall there is a clearly discernible consistent general pattern that starts with initial disbelief, perhaps even intense dislike for the term "Chieu Hoi". This is followed by growing recognition of evidence of the truth of the messages, and a slow transition to acceptance of the belief that the GVN descriptions of the Chieu Hoi Policy are made in good faith. Once arrived at this opinion, if some factors motivate the individual to leave the Front and at the same time others motivate him to move toward the GVN, the decision to rally and the actual rally becomes only a matter of finding or making an opportunity.

Almost all of the ralliers placed their first consideration of the possibility of rallying at a point in time between one and two years before actually rallying. The most frequently cited reason was the fact that they did not yet believe fully in what the leaflets said. Investigation of the time lag between consideration of rallying and actually doing so, in cases where there was a considerable time gap between having made a decision to rally and the actual rally, indicate the primary reason was constant surveillance—the validity and generality of this reason is supported by the results of several more lengthy related studies not reported here.

Thus knowing about the Chieu Hoi Program, knowing how it works, knowing how to rally, knowing what to expect, believing that good treatment will be received, and staying alive long enough for accretion of credibility is essential in inducing rally. Family urging of the prospective rallier is particularly effective for VC, and for NVA where relatives or friends exist; the family can explain the program, can cite the well-being of other ralliers, and assist by escorting him to the rally point or by making prior arrangement for a safe reception when rallying.

In summary, the thinking and feeling processes that lead to a decision to rally operate over a one to two year time period if unusual situations do not occur.

SUMMARY

As one part of a total systems approach to the complex manifold problems involved in attempting to measure the effectiveness of PSYOP as a military function in a field operational setting (Vietnam), the basic ingredient of all PSYOP—messages—was selected for a total-detail-level examination. For this task a total of 700 NVA and VC ralliers and prisoners was interviewed (200 NVA ralliers, 200 VC ralliers, 100 VC prisoners, and 200 NVA prisoners). The issue of effectiveness of PSYOP

messages was fractionated into six aspects or dimensions; proximity of media, clarity of reception, language appropriateness, thematic comprehensibility, credibility, and evocation of behavioral response. Questions applicable to each aspect were formulated and used to query the data resulting from the rallier and prisoner interviews.

Step-by-step analysis of the data in relation to the first five of the six criteria demonstrated the pre-eminence of leaflets and airborne loudspeakers as effective media in the sense that they do reach the enemy, are understood, and have some credibility. An even more searching test of the sixth question or criteria showed that leaflets, to a much greater extent than loudspeaker messages, were effective in that they contributed to the defection of two-thirds of the VC soldiers and two-thirds of the NVA soldiers sampled. Almost one-third of the VC and one-half of the NVA ralliers maintain they would not have defected if they had not read leaflet messages.

The authors advise that the results of this study and their implications be considered with caution. It is clear that the much-maligned leaflet has received unmerited disparagement from enthusiasts for other media but it must be remembered that leaflets represented about 95% of the planned PSYOP effort in Vietnam. It is not possible to say whether the same amount of expense and effort devoted to another media would produce equivalent returns and the problem cannot easily be subjected to cost; yield analysis.

EAST EUROPEAN ATTITUDES TO THE VIETNAM CONFLICT*

BY RADIO FREE EUROPE

The results presented in this preliminary account of the effectiveness of Western international broadcasting efforts in the formation of East European opinions toward the U.S. involvement in Vietnam show RFE's audience covered a broad range of the attitudinal spectrum. The listeners were far from unanimous in approving U.S. policy.

INTRODUCTION: SAMPLE AND METHOD

This is a preliminary report, based on interviews with 583 Hungarians, 569 Poles, and 261 Czechs and Slovaks—1,413 respondents in all. Interviewed in four West European countries, they were in nine cases out of ten on temporary visits to the West and have since returned home; only 10% of the sample comprised defectors, refugees, and emigrants.

* * * * *

Among the 1,413 respondents, there was a predominance of males, urbanites, and the better-educated, with a disproportionate number fit-

*Excerpts from "East European Attitudes to the Vietnam Conflict: A Study in Radio Effectiveness," Radio Free Europe, Audience and Public Opinion Research Department, July 1967.

ting into the higher occupational categories. Overall, the general run of the interviewees consisted of "opinion leaders."

The interviews were done by independent research institutes in various West European countries, the interviewers being in no way identified with Radio Free Europe.

I. Attitudes To The United States Course in Vietnam

Respondents were asked whether they considered the U.S. course in Vietnam to be "right," "wrong," or "right in some respects and wrong in others." In Table 1, half the Hungarian and Polish samples and nearly half the Czechoslovak were critical of American policy in Vietnam.

II. The Most Important Factors in Attitude-Formation Toward The U.S. Course in Vietnam

Once his attitude toward the U.S. course in Vietnam had been ascertained, each respondent was asked to select from a list the influences he thought had contributed to his opinion. The list included the three major mass-communication media (press, radio, television) as well as informal channels ("discussion with friends and relatives"); he could also indicate that, mistrusting contradictory influences, he had used his own resources ("thinking the matter over by yourself"). Lastly, each respondent was encouraged to volunteer unlisted influences (few did volunteer any).

Table 2, shows the five items in the order in which they were submitted to the respondents. Radio, standing fifth in the order of submission, was the most frequently cited influence in two samples and the second most frequently cited one in the third, a result that argues against any link between responses and placement in the list.

Radio was the strongest influence among the Hungarians and the Poles, and the second strongest among the Czechs and Slovaks. The frequency of the "discussions" and "thinking it over" responses in all three samples is typical for the attitude formation process as seen by the respondents involved.

Television in all three samples turned out to be less important not only than radio and newspapers but than the two other options as well. Only in the Polish sample did television emerge as an important attitude-forming factor. As for newspapers, their showing was significant. Radio, it must

Table 1

	"What do you think of the U.S. course in Vietnam?"		
	<i>Hungarians</i>	<i>Poles</i>	<i>Czechoslovaks</i>
	%	%	%
Right	19	31	38
Right in some respects and wrong in others	26	20	17
Wrong	50	49	44
No answer	5	*	1
	100%	100%	100%

*Less than 0.5%

be remembered, refers to both regime-controlled broadcasts and the uncensored ones from abroad; newspapers on the other hand refer, in practical terms, to the communist press alone.

	<i>Hungarians</i>	<i>Poles</i>	<i>Czechs/Slovaks</i>
Listening to the radio	57%	71%	53%
Reading the newspapers	47%	60%	53%

The above figures suggest that radio listeners (including listeners to Western radio) may not be impervious to the tendentious "interpretation" of the U.S. course in Vietnam carried by the Hungarian, Polish, and Czechoslovak press.

III. Reference to RFE, VOA, BBC, And The Domestic Radios As "Important" in Forming Opinions About Vietnam

Those who regarded "listening to the Radio" as an important influence on their Vietnam opinions were asked to specify stations. For the purposes of this preliminary report, minor Western stations were disregarded. [The results are in Table 3.]

Of the three major Western stations, the only one with an impact approaching that of the domestic radios on attitudes to Vietnam was RFE. Among Poles, Radio Warsaw and RFE were specified about equally, another indication of RFE's authority in Poland.

The Hungarian interviewees cited Radio Budapest somewhat more often than the Poles cited Radio Warsaw, and they mentioned RFE somewhat less often than the Poles did. This result is hardly surprising: Table 4 shows that Hungarian respondents hostile to the U.S. course in Vietnam outnumber its supporters even among the regular RFE listeners.

In the Czechoslovak sample, references to radio—both the domestic broadcasts and RFE's—occurred less frequently than in the other two samples. The importance Czechs and Slovaks accorded to "thinking the

Table 2

VOA	6	10	6

matter over by themselves" (see Table 2) suggested a measure of distrust for all communications media.

The differences among the Hungarian, Polish, and Czechoslovak results should not obscure the fact that a quarter of the Czechoslovak, a third of the Hungarian, and two-fifths of the Polish respondents ascribed to RFE a decisive influence on their Vietnam attitudes. Combining the three national samples produces the following results:

Domestic radio	40%
RFE	34%
BBC	11%
VOA	8%

For every respondent whose attitudes to Vietnam were influenced by BBC, nearly four were influenced by the regime station. The comparable ratio for VOA was 1:5. Of the three major Western stations, obviously only RFE is at present capable of effectively challenging the domestic radio on issues like Vietnam.

IV. Attitudes To The U.S. Course In Vietnam By Regular RFE Listeners

Table 4, below, compares the attitudes of regular RFE listeners (defined as people who tune in more than once a week) with those of the others in the three samples. Irregular listening (less than once a week) was reported by under 10% of the interviewees. The "others" therefore consist mainly of non-listeners.

Table 4

Attitudes of Regular RFE Listeners and "Others" to the U.S. Course in Vietnam						
	HUNGARIANS		POLES		CZECHS/SLOVAKS	
	Regular RFE listeners %	Others %	Regular RFE listeners %	Others %	Regular RFE listeners %	Others %
U.S. course is right	26	11	43	20	46	32
partly right, partly wrong	36	17	25	16	18	15
wrong	37	63	30	64	35	52
No answer	1	9	2	—	1	1
	100%	100%	100%	100%	100%	100%

Interestingly, the degree of approval by regular RFE listeners was lowest among the Hungarians, higher among the Poles, and highest (although by a very narrow margin) among the Czechs and Slovaks, while the same ranking, at a considerably lower quantitative level, prevailed among the "others." It is equally significant that the only sample in which regular RFE listeners opposing the U.S. course in Vietnam (37%) outnumbered those favoring it (26%) was the Hungarian, in which the "others" rejected the U.S. course by a six to one ratio.

The Polish results deserve scrutiny. They indicate an especially close rapport between RFE and its Polish regular listeners, as shown by the very sharp split between the attitude patterns of the regular listeners and the others. Polish approval of the U.S. course in Vietnam was twice as frequent—and disapproval half as frequent—among regular RFE listeners as among the "others." In regard to regular RFE listeners, the proposition of unqualified opponents of the U.S. course in Vietnam was smaller for the Poles than for the Hungarians or even the Czechs and Slovaks.

A quantitative expression of the differences between the attitudes of RFE's regular listeners and the others can be given by a *new approval index* of both groups in the three national samples. The index is computed by subtracting negative attitudes ("U.S. course is wrong") from positive attitudes ("U.S. course is right")—disregarding indecisive answers and refusals.

NET APPROVAL INDEX		
	Regular RFE listeners	Others
Poles	+18%	-52%
Czechs/Slovaks	+14%	-24%
Hungarians	-18%	-70%

The degree of attitudinal difference between the regular RFE listeners and the others is, for each of the three countries, expressed by the "distance" between the two figures. That distance is the largest in the case of the Polish sample—"70". The Hungarian sample ("52") follows, and then the Czechoslovak sample ("38"). Looked at in this way, the impact of RFE upon its Polish regular listeners appears extremely impressive. They provided the highest net approval index for the U.S. course in Vietnam in spite of a powerful hostility on this score among the remainder of the Polish sample. By the same token, RFE's impact on its regular listeners in Czechoslovakia seems to be less decisive—with regard to Vietnam—than in either Poland or Hungary, since Czechoslovak public opinion, as reflected by the preliminary findings under discussion, is generally less hostile to the U.S. course in Vietnam. It has already been shown (Section III) that Table 4's evidence of RFE's variant impact among regular listeners in Czechoslovakia, Hungary, and Poland has the support of other data.

V. Evidence Of Direct Effect Of RFE On Attitudes to Vietnam

The 476 Hungarian, Polish, and Czechoslovak interviewees who regarded RFE as an important influence on their attitude toward Vietnam were asked to specify *how* RFE broadcasts affected their opinions. [See Table 5.]

Nearly half of the Hungarians, nearly two-fifths of the Czechoslovaks, and nearly a third of the Poles who listed RFE as an important influence on their attitude to Vietnam (see Table 2) revealed that RFE was *the* decisive influence. It was RFE which "made them think the way they do" or which, less frequently, dissipated an earlier attitude and thus "changed their opinion."

Table 5

"Did listening to RFE. . .	Hungarians %	Poles %	Czechs/Slovaks %
. . . confirm the opinion you already had?"	34	41	52
. . . make you think the way you do?"	44	22	31
. . . change your opinion?"	2	9	5
. . . leave your opinion unchanged?"	26	26	6
No answer	2	2	6
	108%*	100%	100%

*More than 100% because of some multiple answers

Significantly, RFE's attitude-forming role was most pronounced in the case of the Hungarians, who represent a public opinion predominantly hostile to the U.S. course in Vietnam (see Table 1). In this generally critical climate, tendentious regime propaganda about the war itself, emphasizing its "David and Goliath" aspect, exerts a heavier impact. And, more important, "discussions with others" tend to reinforce negative rather than positive attitudes toward the U.S. line in Vietnam. Under such circumstances, positive attitudes to the U.S. course in Vietnam are more strongly in need of RFE's support in Hungary than, for instance, in Czechoslovakia.

GENERALLY, A MASS MEDIUM IS ALREADY CONSIDERED VERY EFFECTIVE WHEN IT SUCCEEDS IN REINFORCING EXISTING ATTITUDES. TABLE 5 CLEARLY SHOWS THAT, AS FAR AS THE VIETNAM ISSUE IS CONCERNED, RFE'S IMPACT WENT BEYOND REINFORCEMENT: IN A LARGE NUMBER OF CASES ATTITUDES WERE ACTUALLY FORMED AND CHANGED!

CONCLUSIONS

Attitudes to the U.S. course in Vietnam may be regarded as a sound test of RFE's impact and effectiveness as a communicator in East Central

Europe. The Vietnam issue is salient enough to provoke opinions (only 5% or less failed to answer the first question) but still stands apart from the respondents' most immediate personal concerns.

Two findings desire particular emphasis:

1) Many interviewees indicated that their attitudes to the U.S. course in Vietnam were formed under the direct influence of RFE. The implication is that any full or partial endorsement of American policy was due not to a general predisposition in favor of "U.S. courses" but to the specific content of RFE communications on the subject of Vietnam.

2) RFE listeners were far from unanimous in approving the U.S. policy in Vietnam.

This is an important finding. It indirectly reasserts that RFE listeners are an integral part of the active public opinion by which they are influenced and which they in turn can influence. Had the results shown the attitudinal patterns of RFE listeners on this issue to be the exact opposite of the remainders of the three samples, there would have been a question of whether or not RFE's Vietnam broadcasts "preach only to the converted." By extension, RFE could have been suspected of talking to the completely disaffected and them alone. Whatever the actual numbers of the disaffected, their role in any gradual and patient transformation of economic, political, and "power" relationships from within can be only limited. The results presented in this preliminary report show that RFE's audience covers a broad range of the attitudinal spectrum. There seems to be no danger that the station's message might fail to reach those people, both inside the "Communist Establishment" and outside it, through whom progressive changes in East Central Europe must come.

USING MOTION PICTURES TO AID INTER-CULTURAL COMMUNICATION*

BY NEIL P. HURLEY, S. J.

The author, who has experimented with screen education, believes there are three types of film. He outlines six rules which explain why motion pictures are capable of creating intercultural bonds among peoples of the world. Twelve films are evaluated in terms of their contribution to intercultural communication.

From their very inception, motion pictures enjoyed a world-wide appeal. Without the barrier of language and all the accompanying cultural and psychological associations, films crossed political boundaries with the ease of the weather. Charlie Chaplin, of all the performers on the silent screen, became known rapidly by such endearing names as Charlot (France), Carlos (Spain), Carlito (Latin America), and Kärlichen (Germany, Austria and Switzerland). Vision became language as the silent

*From *The Journal of Communication*, XVIII (June 1968), pp. 97-108. Reprinted with the permission of the *Journal of Communication*, copyright holder, and the courtesy of the author.

film learned to touch that universal cord latent in mankind. True, there were still cultural factors which influenced popularity in varying degrees. For example, Griffith's "The Birth of a Nation" was a distinct product of American culture just as Eisenstein's "Potemkin" was unmistakably a Soviet statement. Nevertheless, in both instances, the audiences overlooked the conditioning factors of time and space as the magic of the camera depicted mutiny, slavery, rebellion, death, and sacrifice in an historical reconstruction hitherto unknown to mankind. In the pre-talkie era, motion pictures served as channels of inter-cultural communication.

Yes, motion pictures ushered twentieth-century man into the "imaging revolution" where psychology was as important as logic, where social context ranked with the traditional moral evaluation of the individual, where mood rivalled categorical statements, and emotion was as weighty as reason. Perhaps the end of "typographic man," to use Marshall McLuhan's phrase, came between the two great wars when a global audience made up of all classes, races, creeds, ages, and sexes could, for a modest admission fee, see the implications and consequences of human involvement in every conceivable circumstance of life. Women vibrated in empathy with Greta Garbo in her tragic portrayals of Anna Karenina, Queen Christina, and Mata Hari, and were attracted by Douglas Fairbanks and Ramon Novarro. Men learned about *femmes fatales* such as Pola Negri and Marlene Dietrich and identified with heroes such as William S. Hart, Clark Gable, and Leslie Howard. Children learned about the Wild West, gangsterism, war, and the adult world through a Tom Mix, a James Cagney, a Jean Gabin, a Humphrey Bogart, a Frederic March, or a Charles Laughton.

Unfortunately, because motion pictures have been seen largely as a profit-seeking venture; educators, parents, and the cultural guardians of society have been late in recognizing its potential as a formative and informative instrument for creating the bases of community: shared experiences at the affective and cognitive levels. One reason is that the image is so close to us that we take it for granted. Curiously children understand pictures more readily than adults as Antoine de Saint-Exupery indicated in *The Little Prince*. Whenever he drew a boa constrictor which has swallowed an elephant, adults thought it was a hat until he drew the elephant inside the swollen body of the boa constrictor. Something very similar takes place in the cinema. We see the thematic expression but not the non-thematic reality with which the film artists have to work. The hidden elephant in every media experience is the set of rules of the particular communications game. For instance, there are six such rules which explain why motion pictures are capable of creating intercultural bonds among peoples of the world.

1. A physical law—that a transparent plastic material sufficiently flexible to unwind from a reel could produce a number of swiftly moving still images.

2. A physiological law—that an image on the retina of the eye persists long enough to give the illusion of continuity when successive still pictures are passed rapidly before a spectator.

3. A psychological law—that through skillful editing and montage, induced associations from memory, mind, and imagination suggest the inner life of persons photographed in illusory motion.

4. A sociological law—that any group of individuals emerges more cohesive in sentiment and purpose after a common communications experience.

5. An anthropological law—that people have curiosity about other peoples and want to learn *how* they meet the four essential *whats* of life: (a) survival and development; (b) love and hate; (c) authority and disobedience; (d) belief systems—integration in the present social order or protest against it.

6. An ethico-religious principle—based on identification: (a) negatively with villainy; and (b) positively with self-sacrifice and vicarious suffering.

It is interesting that these six rules of cinematic experience seem to be bound up inextricably with certain constants of reality. In summary, we are saying that man has discovered a way of recording both visually and aurally experiences of nature, life, and human activity so that a mirror-image of reality permits man to discover himself and the world about him in greater depth. Let us now show more concretely how film can enable the human process of personal and social existence to be better understood, thus furthering inter-cultural understanding.

The author has experimented with screen education in both Chile and the United States for more than two years, at both the high school and university level in social science and religion courses. Films proved an especially valuable ally in such courses, especially for beginners. The author discovered that there are three types of film:

1. films peculiarly apt for members of a given society;
2. films which reveal important differences between cultures in a way which is fresh and non-polemic;
3. films which are transcendental and incorporate members of all cultures indiscriminately into a state of mind characterized by solidarity and allegiance to the human race.

The twelve films which the author has found particularly illuminating in teaching certain traditional disciplines are:

- | | |
|---|-----------------------------------|
| 1. The Leopard | 7. Children Adrift |
| 2. Zorba the Greek | 8. Mint Tea |
| 3. Hombre | 9. Phoebe |
| 4. The Lilies of the Field | 10. Le Boulevard de Saint Laurent |
| 5. West Side Story | 11. The World of Marshall McLuhan |
| 6. The Loneliness of the Long Distance Runner | 12. The Parable |

The first six films are full length commercial movies, while the last six are short subjects ranging from twenty minutes to an hour in length. The film, *The World of Marshall McLuhan*, was a television program now available from the National Broadcasting Company in color.

1. *The Leopard*, a film directed by Visconti from the novel by Giuseppe di Lampedusa, had an extraordinary impact on Chileans when it was shown in Santiago in 1964, because the presidential election later that year heralded radical changes in the social structure of Chile. A country with great concentration of wealth, especially land, Chile found itself facing the same social upheaval so dramatically described by di Lampedusa in his novel on the passing of the *ancien régime* in Sicily.

The graphic representation of drastic social reform by Garibaldi's "red shirts" on the island of Sicily in 1848 produced historical echoes in those fearing a Communist victory at the polls. The important points which emerged as focal issues for Chilean viewers of *The Leopard* were:

a. Economics—the importance of relating concrete commercial transactions and circumstances of economic power to a cultural framework.

b. Psychology—the difficulty of regressing from a higher standard of living to a lower standard of living and the opportunistic psychology of the *nouveaux riches* who emerge to fill the social vacuum left by the displacement of the feudal nobility.

c. Sociology—the implications of abrupt social change and the passing of one social code where honor and status predominate to one where wealth and influence matter.

d. Religion—the ties between religious conviction and social stability, showing that the environment is a conditioning factor in religious observance.

2. *Zorba the Greek*. A rendition by Jules Dassin of Nicolai Kazantzakis' novel by the same name, this film is an admirable example of the thesis of Marshall McLuhan that "the medium is the message" and that oral cultures produce "cool types" such as Zorba and print cultures "hot types" such as Zorba's English employer. According to McLuhan, a "cool type" is mysterious, uninhibited, with little sense of time, while a "hot type" reveals a clearly defined, time-conscious, orderly, and efficient personality structure.

It is interesting that Latin audiences see in Zorba a resourceful, fun-loving person with dignity and freedom, not a parasitic, amoral, indolent character such as an Anglo/Saxon audience sees. On the other hand, Latins tend to interpret pejoratively the narrator who is Zorba's boss. For them he is a slave of the clock, overly serious, and a captive of an arbitrary and unreal set of convictions about honesty, fidelity, and industriousness.

The film is far from being a great film, one of the chief weaknesses being the lack of psychological preparation the audience receives for the narrator's sudden conversion to the belief system of Zorba. Despite its defects, the film is admirable as a basis for intercultural understanding,

especially in terms of how characterology is intimately related to a specific communications matrix.

3. *Hombre*. A picture directed by Martin Ritt is excellent for giving expression to minority views. In one of Hollywood's rare exceptions to the classic cowboy film, the Mexican and Indian characters are shown in a favorable light with the "white man" portrayed in a villainous light. The long-standing paternalism of both the Anglo and the male is subtly examined in a suspense-ridden movie in which the dialogue moves even swifter than the action.

The heroism which the picture portrays rests on the notion of vicarious suffering. For this reason it has appeal to youth especially in an age of iconoclasm and skepticism. The film is saved from pathos by an excellent portrayal of the Indian hero by Paul Newman. It is never clear why he goes on the stage-coach trip with the others, but plot lapses such as these are forgivable when compensated for by sustained creative achievement elsewhere in the film. As an obvious intercultural bridge, *Hombre* shares with *Zorba* the advantage of immense appeal to peoples in the underdeveloped world where the ethos of thrift, hard work, and wealth have not taken hold. These same audiences invariably like films such as the *Apu* trilogy of Satyajit Ray, De Sica's *Shoeshine* and *Bicycle Thief*, and John Ford's *The Grapes of Wrath* and *How Green was my Valley*. It is interesting that some pictures find greater popularity abroad than at home (*The Blackboard Jungle*, *Rebel Without a Cause*, *David and Lisa*).

4. *Lilies of the Field*—Another excellent example of how film can portray national types. The plot centers on an urban Protestant Negro, self-sufficient but not self-conscious, and a strict German Catholic nun, domineering by instinct. The contrast between the two is well-drawn, especially in the scene when Sidney Poitier, as the Negro, defends his pluralistic belief system to the unyielding Mother Superior. This confrontation is the beginning of mutual respect and even fondness.

Other touches which many audiences miss and which only a second viewing can disclose is the mediating role which Sidney Poitier plays between the Mexican-Americans and the nuns. He is a blend of "hot" and "cool," to use McLuhan's categories. He stands up to the White Southern Protestant and his prejudices; he makes friends with the Mexican cafe owner, caught between the culture he came from and the one in which he finds himself; and he appeals to the Irish-American Catholic priest who serves the region with his mobile church van.

Curiously, Poitier is the stranger, the wanderer, the pilgrim. But this marginal man proves to be all things to all men. He wins the affections of all the different racial, religious and class groups; he is at home with the vortex of social change; he knows that to be is to be different; he needs no privileged cultural cocoon or environmental prop. He is the only character of the film who is living in the present; all the others are tilted toward the past.

5. *West Side Story*. This stunning film blends music, choreography, and color in a patent inter-cultural example. Borrowing from the feud of the Capulets and the Montagues in Shakespeare's *Romeo and Juliet*, the picture transplants the scene from Verona to upper west side Manhattan. The white gang and the Puerto Rican "pandilla" provide the backdrop of racial tension for the poignant love affair between the Puerto Rican girl and the Anglo-Saxon youth.

Latin American audiences react fearfully, as a rule, to this film. For example, Chilean audiences saw the threat of American imperialism as an imminent one. They miss the references in the film which portray the Latin reaction to the shadowy side of life in America as well as the voluntary nature of the Puerto Rican migration to New York. Nevertheless, Latins sympathize with the film, finding in it a vehicle of authentic expression of some of their most basic values and emotional responses.

The film offers perhaps greater rewards to Anglo-Saxon audiences, particularly those people who are inadequately informed concerning Latin America. Some still believe that it is a giant seedbed of caudillos, revolutions and anti-Americanism, characterized mainly by the bossa nova, the rhumba, bootblacking, begging, and banana crops. A film such as *West Side Story*, if discussed in a mixed group of Anglos and Latins, can do much to bring into sharper focus the mutual image each group has of the other and the underlying value-system which supports it.

6. *The Loneliness of the Long Distance Runner*. Directed by Tony Richardson, this film cuts across many boundaries of class, culture, and creed to touch a universal chord in man. The film has a peculiar appeal to adolescents because it sensitively portrays how the "establishment world" of authority and adults is seen subjectively by a youth from Nottingham who has been sentenced to Borstal Reform School for theft. *The Loneliness of the Long Distance Runner* offers the adult world a reflection of themselves in the mirror of youth.

The inter-cultural value of this existential motion picture is that it unites the rebellious and the protesting elements against those who hold the reins of power and sanction. Highly credible, this picture appeals to all cultures where the adolescent revolt has taken root. Since the death of James Dean, the phenomenon of Colin Smith is world-wide: the *blousons noirs* of France, the *Teddy Boys* of Holland, the *Halbstarken* of Germany, and the *Stilyagi* of Russia. In the television scene, we see Colin and his friend turn off the sound and ridicule the adult world with its empty rhetoric and moralizing postures. The communication's "short-circuit" between generations has never been shown more forcefully.

SELECTED SHORT FEATURES

7. *Children Adrift*. This French filmette is ideal for inter-cultural exchanges. The author has found that this tender film about the life of children in a metropolitan banlieu gives a convincing portrayal of the joys and the sorrows of vagrant children. In the Inter-American conference

held at the University of Notre Dame last May, this film welded together the sentiments of both Latin Americans and North Americans. The culture of poverty is as real as the culture of youth and, we might add, for many just as unknown.

Children Adrift is a highly visual film, almost worthy to be called silent. As such, it does not jar any national sensibility or trigger any defensive mechanism. Since the world of slum-dwelling children is, essentially, a nonthreatening experience, a multi-national audience will usually let down the psychological barriers and become united in the deeper community of the family of man.

8. *Mint Tea*—Another French film which appealed to the Notre Dame Inter-American Conference, mainly because it portrayed loneliness within the soul of a homosexual. Centered on persons whom we meet in a Parisian sidewalk cafe, the picture shows the inability of a young, effeminate-looking man to relate to those around him. The close-ups (the sideward glances, the immobile face, the empty gaze) serve to heighten the young man's state of incommunicability.

Unfortunately we know deviant behavior only through statistics, sensational newspaper accounts, and documentaries, but rarely through the eyes of the artist. Not since Fritz Lang's *M* gave us a compassionate account of a child-murderer, have we seen such serious treatment of what society calls abnormal. One of the fine touches of *Mint Tea* is the final scene of an elderly gentleman seated alone with his tea.

9. *Phoebe* is a product of the Film Board of Canada. It is remarkable from several points of view. Its psychological power lies in the ability of the teen-age Phoebe, pregnant and unwed, to communicate with her boyfriend, her parents, and the school authorities. Furthermore, it shows the social context of her home, suggesting why she might have sought affection in the way she did. Artistically, Phoebe is a celluloid cameo with superb angle shots and mood scenes. Its handling of what Henri Bergson called "inner time" is splendid. By drawing out Phoebe's imagined confession to her mother, we are reminded of Eisenstein's classic bridge scene in the *Forty Days That Shook the World*. Another fine artistic touch is the baroque trio on the beach who imbue the film with a Fellini-like quality.

The intercultural contribution of *Phoebe* as cinema is its transcendental theme. Avoiding the moralist's temptation to portray as sordid an immature romance, Phoebe spells out delicately the ramifications of young love consummated. We do not know what Paul will do when Phoebe calls him to tell him about their future child. We have seen her previously imagine the worst (his running away) and the best (his taking her into his arms and promising to get a job). The workings of the adolescent female imagination is brilliantly achieved with rapid shuttle-like scenes between extreme optimism and extreme pessimism.

Again we have a subtle indictment of the adult world, but one so masterfully achieved that national and cultural considerations create no obstacle to appreciation. The author has found that in Chile teen-agers of

the middle and upper class accepted Phoebe's plight as an accurate representation.

10. *Le Boulevard de Saint Laurent*—Another film of the Film Board of Canada. The depressing scenes of the Bowery section of Montreal create a striking visual impact which surmounts the barrier of the difficult French soundtrack.

The film portrays several forms of asocial behavior but in suchwise that we see human beings and not merely agents of socially repugnant conduct. The viewer is more inclined to compassion than condemnation. Starting with a nightclub "strip-tease," we are taken on a camera tour of *Le Boulevard de Saint Laurent*. It is mostly "night people" who fill the screen with only occasional shots of dishevelled women and dirty men sitting on park benches or shuffling along in the daytime.

In showing the film to young college girls from the upper class of Santiago, the author insisted that we were not looking at a certain section of Montreal but that every large city has its equivalent of *Le Boulevard de Saint Laurent*. The students applauded and expressed their sincere thanks, demonstrating that social evil can be portrayed in a way which serves humanistic, supra-national purposes. The reaction of students from different nations is unvariably one which recalls Terence's dictum: "*Nil humanum puto a me alienum.*"

11. *The World of Marshall McLuhan*—A film copy of a one-hour television show based on the book which McLuhan published with Quentin Fiore: *The Medium is the Message*. We earlier made reference to McLuhan's thesis that "the medium is the message" in commenting on *Zorba the Greek*. McLuhan's latest elaboration of this thesis in the form of a pun states that most people live not in the present but in the previous environment. Apart from the avant-garde artists and astute students of social change and cultural flux, the great majority look through a historical rear-view mirror (recall *The Lilies of the Field*). To borrow computer terminology, only a few live in "real time," where knowledge can be used to shape the present.

This film documents McLuhan's observations with brilliant sequences of overlapped images, out-of-sight voices, out-of-focus shots, and feverish intercutting of scenes à la *Eisenstein*. The younger generation find McLuhan refreshing and provocative. The film as a rule, irritates older people. How such films divide audiences is a significant cross-cultural phenomenon. The younger generation, products of the "electronic age," basically sympathize with McLuhan. This has been the author's experience in his teaching experiences in both North and Latin America. *The World of Marshall McLuhan*, captures viewers in diverse cultures, compelling them to co-create the experience. Disconnected, suggestive, a Joycean "stream-of-consciousness" experience, this film can help bring prepared viewers to understand the bias in media and, consequently, the perceptual prejudices which are unconsciously smuggled into every culture.

12. *The Parable*—A film made by the Protestant Council of New York for presentation at the 1964 New York World's Fair. It is a remarkable attempt to use the medium of cinema to convey to 20th century mankind the significance of Christ's life and message. In a sense, both can easily become historical relics, recalling the McLuhan insight that we live life backward and not forward. In order to bring freshness to the gospel story, the makers of *The Parable* resort to a circus background. It is ironic that the spirit of Christ must be clothed in the character of a clown. What he does, however, is ridiculous: exposing himself to the anger of the powerful by helping the underprivileged (the worker, the unemancipated woman, the victim of racial injustice). Finally comes the scene of the clown's voluntary death: an agonizing death scene in the harness of one of the live marionettes, aloft in the high rotunda of the circus tent.

The author led eight film discussions on *The Parable* in Chile with laity and clergy, atheists and Marxists, youth and adults. The diversity of interpretations clearly indicate that the film is a true parable. That is to say, just as in Christ's parables, so too in this film, there are many levels of meaning, some more overt than others. Three points in particular are interesting:

a. Marxists, atheists, and not a few Christians perceive a subtle criticism of organized religion. Thus the tent top in the parallel-crucifixion scene, some claim, looks like a church cupola; the youthful spectators wear cowl-like hoods; the harness-wires are jerked to the sounds of something close to church chimes. The impression is one of prophetic judgment on all institutions as accomplices in the death of the Christ-figure.

b. There is a strong insinuation that the followers of the Christ-figure have not caught His message. They seem to be aloof from the march of history, colorfully portrayed by a succession of decorative floats bearing the names of nations. Just as the picture ends, the man on the donkey seems to veer off onto a side path, no longer part of the parade. Although the evidence is scanty, it is not demonstrably clear that the master of the marionettes undergoes a conversion. Some viewers maintain that he puts on the clown's grease paint to dissimulate the Christ in order to sow discord. These would also hold that the figure on the donkey in the final scene is not the same as at the beginning, but rather the disguised master of the marionettes.

c. It is not certain that there is a resurrection of Christ for we only see a springtime scene of peace and harmony but no physical person resembling the clown. The last scene is reminiscent of the first and cannot be thought to be a clear sign of a physical resurrection.

The intercultural power of this film needs no special argument. The figure of Christ is of transcendental interest and the multiple interpretations carefully folded into the picture, either deliberately or inadvertently, give free play for the imaginations and minds of viewers with divergent backgrounds. The film succeeds in teaching many things ac-

ording to the capacity of those learning. As such it is well-named *The Parable* and revitalizes contemporary mankind's jaded perception of the Christ who taught in parables.

In a world growing smaller and smaller due to satellites, TV, computers, and lasers, it is imperative that attention be given to programming which transcends provincial interests. The author is convinced that underlying the undeniable differences of men and nations, there is a sameness, not a monochromatic sameness, but an inexhaustible wealth of sensibility, spirit, and emotional resonance. We are at an evolutionary juncture where we are seeing civilization in the singular. Our education must recognize that the "image" is the worldwide language which can unite men in the depths of their being across all known barriers of sex, race, class, nation, politics, and religion.

THE FUTURE OF INTERNATIONAL BROADCASTING* **

BY FRANCIS S. RONALDS, JR.

International broadcasting is defined as broadcasts prepared in one country but intended for other countries. The discussion of its trends and implications suggests a growing importance.

The world may become a global village some day, and home receivers may be picking up audio and video signals via satellite from all over the world. But that "some day" will not be soon, certainly not in this decade and probably not in the next.

On the other hand, if we judge by the investments going into transmitters for use in external propaganda efforts via short- and medium-wave radio, and if we accept estimates that the number of short-wave radios will nearly double during the seventies, then there is no doubt that international broadcasting is alive and well, enjoying healthy middle age.

DEFINITIONS

Before examining the above claims, let us define terms. Just what is international broadcasting?

. . . I exclude domestic broadcasting in foreign countries and speak solely of broadcasts prepared in one country but intended for other countries. Such "external" broadcasts may be mounted by governments, either officially as external services or unofficially as clandestine stations, by "public/private corporations," by religious groups, and by commercial

*Special thanks for help in preparing this paper go to Mrs. Barbara Schiele, VOA's inexhaustible fount of facts and figures on the subject.

**Excerpts from "The Future of International Broadcasting," *The Annals of the American Academy of Political and Social Science*, Vol. 398 (November 1971), pp. 71-80. Reprinted with the permission of the American Academy of Political and Social Science and the courtesy of the author.

operations. Most of the major international broadcasters, including Moscow, Radio Peking, Radio Cairo, the Voice of America (VOA), and the Deutsche Welle (the external radio of the West German government) belong to the first category. At the moment of writing, there are seventeen Communist and fourteen non-Communist clandestine radio stations. The British Broadcasting Corporation and certain Commonwealth stations patterned after it, including the Canadian Broadcasting Corporation and the Australian Broadcasting Corporation, are granted appropriations by Parliament but are not directly controlled by the government currently in power. Radio Free Europe and Radio Liberty . . . [may] be converted into similar "public/private" corporations. . . . Radio Peace and Progress, although housed in the same building as Radio Moscow, purports to be supported by Soviet public organizations. . . .

Major religious broadcasters. . . may carry news but . . . concentrate on bringing the word of God to people who might otherwise be deprived of it.

* * * * *

One service of Radio Cairo beams out recitations from the Koran for 98 hours a week. Of the commercial broadcasters carrying international services, the largest are Radio Luxembourg and Europe Number One—the latter located in the Saar. Their audiences are estimated in the tens of millions. The Commercial Service of the Ceylonese Broadcasting Corporation, although not described as an external service, would not be so lucrative if it were not for its millions of listeners in India.

I am aware of only one television station with an "external" service: Tallin TV is beamed across the Baltic in Swedish and Finnish. There are, however, important "spillover" audiences for a few TV and many national radio stations. Of political significance is the considerable if unmeasurable viewership for Austrian TV across the borders in Hungary and Czechoslovakia; there is a lot of cross-watching between East and West Germany, particularly in the Berlin area; and Estonians can pick up and understand Finnish TV programs.

Listening to a foreign country's domestic radio broadcasts is traditional in Europe, where some powerful medium- and long-wave signals virtually blanket the continent. Accra is heard throughout Anglophone West Africa, Radio Conakry in the French-speaking countries, and Nairobi is popular throughout East Africa. Refugees from China report listening to Cantonese programs from Hong Kong. The U.S. Armed Forces Radio-Television System, broadcasting only in English for troops stationed abroad, is believed to have a very large audience, particularly in Germany, Japan, and Southeast Asia. However, even though spillover listening to such programs may have international political consequences, they cannot rightly be labeled "international broadcasts." With the United Arab Republic, on the other hand, it is difficult to distinguish domestic from external broadcasts. Radio Cairo's three 500-kilowatt medium-wave transmitters can be heard throughout the Near East and North Africa, as

well as in the UAR itself. Its Arabic programing is generally aimed at Arabs everywhere.

In the case of certain international broadcasters, direct listening is supplemented by relays and by "placement." A great many Commonwealth nations continue to relay BBC newscasts and other programs on domestic facilities. Hundreds of stations south of the Rio Grande regularly relay portions of VOA programs in Spanish and Portuguese; two-thirds of Latin America's 3,600 medium-wave stations carried VOA coverage of the flight of Apollo 11. Communist stations do not fare so well. Somewhat to the surprise of experts, Havana so far has not seen fit to relay Radio Moscow, which receives such brotherly support only from Ulan Bator. Little Albania, one of the largest international broadcasters, has only recently begun to relay selected programs of Radio Peking. Largely as a by-product of direct broadcasts, BBC and VOA also ship out vast quantities of taped programs for replay by government and commercial stations all over the world. The Office de Co-operation Radiophonique (OCORA), now absorbed into the foreign service of the French Radio, supplies much of the programing carried over many French-speaking nations in Africa, the Caribbean, and elsewhere. Relay and placement is also common within the East European Communist bloc.

Since this whole range of activity is too broad for coverage in one short article, I will discuss only the politically significant broadcasts of official government and "public/private" stations.

SATELLITES

What about the future? Will satellites make it possible for Moscow, the Voice of America, and other broadcasters to dispense with short-wave and to beam TV as well as radio programs directly into the homes of people practically everywhere?

The United Nations Working Group on Direct Broadcast Satellites says no—not for a long time to come. In a report of February 26, 1969, it concluded:

While it is considered that satellite technology has reached the stage at which it is possible to contemplate the future development of satellites capable of direct broadcasting to the public at large, direct broadcasting of television signals into existing, *unaugmented* home receivers on an operational basis is not foreseen for the period 1970–1985.

In a July, 1970, report to the White House, a panel of U.S. government experts under the chairmanship of W. E. Plummer of the Office of Telecommunications Management came to the conclusion that direct radio broadcasts by satellite, while technologically feasible, are economically out of sight:

Such a satellite could provide a single voice channel to an area the size of Brazil, for up to twenty-four hours a day, with poor to good quality reception by typical FM receivers employing simple outdoor antennas. However, the estimated annual cost would be between \$40 and \$50 million. By comparison, the VOA is presently

reaching the entire Western Hemisphere with a consistently good signal many hours a day for approximately \$1.5 million a year using terrestrial high frequency transmitters for as many as three different programs simultaneously.

The total annual budget of the VOA comes to slightly over \$40 million a year—the price of that one satellite circuit.

The cost of satellite circuits will drop, but other obstacles will remain. Many countries fear a possible loss of control over their own mass media and wish to write into international law a provision preventing broadcasting via satellite into any area where the local government does not desire to have it. Copyright restrictions likewise present nightmarish complications. And last but by no means least, the broadcast spectrum is so crowded in the high and ultra-high frequency ranges that the world Administrative Radio Conference of the International Telecommunications Union held in Geneva in June/July of this year determined that a portion of the spectrum in the newly developed superhigh frequency range would be set aside for use in direct broadcasting by satellite, and for the first time allocated frequencies for direct broadcasting via satellites to home receivers. This means that when and if direct broadcasting by satellite becomes technologically, economically, legally, and politically feasible, new TV sets must be devised capable of receiving signals at frequencies up to 12 *gigahertz*, or 12 billion cycles per second.

So-called educational satellites, capable of relaying a signal into relatively low-cost “community” receiving stations, are a different matter. The United States is due to loft one such “Edsat” in 1974 over the Indian Ocean for use by India. Brazil hopes to get one a year or two later, and the Andean nations are talking about sharing one. However, due to the fears of “cultural imperialism” and the need to tailor educational programs to specific national conditions, as well as to the fact that Edsats will be controlled by the governments of the countries using them, these second-generation satellites are not expected to provide any significant outlets for international broadcasters.

Existing point-to-point satellite stations—expensive installations which send, receive, and amplify extremely faint signals from space—have so far been used sparingly by international broadcasters. The only organization of any kind to purchase dedicated 24-hour voice circuits for extended periods is the Voice of America, which has used them on an experimental basis to feed its relay stations in the Far East. The satellite circuits proved to be more reliable than short wave, but more expensive. As prices fall, satellite circuits may be ordered for regular feeding of far-off relay stations. In the meantime, they will be used occasionally as back-up for high frequency circuits during periods of poor propagation.

GROWTH OF INTERNATIONAL BROADCASTING

With TV out of the picture, the term “international broadcasting” will remain synonymous with international radio for a long time to come. But is international radio becoming more, or less, important? Are the signals

fading away or getting more numerous and more powerful? Are more countries getting in on the act, or are they opting out? Is the number of languages that are broadcast going up, or down? the total time on the air increasing, or falling?

In 1966 there were 52 broadcasting transmitters of 200 kilowatt or greater strength. By 1969 there were 131, 180 in 1970, and in 1971, 185. In Europe, East Asia, the Near East, and Africa alone, there were 47 such transmitters in 1968; now there are 93.

Construction of short-wave superpower transmitters (200 kilowatts and above) moves ahead at a furious pace, increasing by 255 percent over the past five years. Leading the pack is the Deutsche Welle, which is building twelve 500-kilowatt transmitters inside Germany. All twelve are scheduled to go into operation before the Munich Olympics in 1972, and there are plans for new relay stations in Rwanda, Malta, and the Caribbean.

International broadcasts are not limited to short wave, as many people seem to think. Although extra-continental broadcasters reach Africa and the Americas only via short wave, medium wave is very important in Europe and Asia. In the Far East alone, the VOA has three megawatt (one-million watt) medium-wave transmitters—each with a strength twenty times as great as the most powerful United States domestic station. It has others in Europe, the Near East and, for Cuba, in Florida. The BBC pours 600 kilowatts into Europe and has a 1½ megawatt medium-wave transmitter outside the Persian Gulf. The USSR uses medium wave for Europe and the Near East, whereas China covers much of South and East Asia with several powerful medium-wave stations, one believed to have a power of two megawatts. Many of these boom louder than domestic stations in the intended target areas. And the trend is still up. In the period 1968 to 1971, the number of superpower medium-wave transmitters used in international broadcasting jumped by 97 percent and large numbers are reported under construction.¹

Many smaller nations have come into the field. Saudi Arabia, for example, recently inaugurated a megawatt medium-wave station and Congo-Kinshasa [Zaire] has a 600-kilowatt medium-wave transmitter that reaches as far as Abidjan. The greater power does not, however, necessarily mean that the signals will be heard better than before. Spectra for both the short and medium wave-lengths are now so crowded that co-frequency interference limits the effective coverage area. You have to shout louder to be heard at all.

According to the last totting up by the Foreign Broadcast Information Service (the U.S. government radio monitoring organization), in May of 1969 international broadcasts had reached the incredible total of sixteen thousand hours weekly, and were still on the way up. The USSR is way ahead with 1,921 hours. However, if Radio Free Europe, Radio Liberty, and RIAS (Radio In the American Sector of Berlin) are added to the VOA, the U.S. total rises to 2,155. Outside Eastern Europe the United

States is again far behind Communist countries, which carry a whopping 6,478 hours weekly.

The number of professionals employed in the business of international broadcasting is considerable. Of the Western stations, the BBC External Services have the largest staff: thirty-six hundred people. A Royal Commission headed by Valentine Duncan in 1968/69 proposed drastic cuts in British government overseas operations but praised the BBC and even recommended a technological build-up. VOA has a staff of twenty-two hundred, more than half of them technical personnel. Staff sizes of Communist stations are not known, but in view of the number of languages broadcast out of Russia—eighty-two, compared with thirty-eighty for the BBC and thirty-five for the VOA—the USSR's External Services must be huge.

Over the past four years, the number of Communist clandestine stations has increased from fourteen to seventeen, the total broadcasting volume rising by 42 percent, from 450 to 639 hours weekly. The additional effort is aimed mainly at Southeast Asia, presumably in the hope of filling a vacuum left by the expected U.S. pullback from the area.

The expense of this vast effort has been estimated at a billion dollars yearly in construction and operation costs, exclusive of the several hundred million dollars doled out every year for jamming by the USSR, China, Bulgaria, and Czechoslovakia.²

THE IMPACT OF TELEVISION

So, more money and men are going into international broadcasting, and there is evidence that this will continue. But are more people listening? What has been or will be the effect of the development of domestic mass media, particularly television?

Wherever TV has taken hold, it has had a powerful effect on radio listening, and on virtually every other leisure-time activity, as well. The most comprehensive international study of the subject has been carried out under Dr. Alexander Szalai of UNITAR, the United Nations Institute for Training and Research.³ It covers, on a twenty-four-hour basis, the leisure-time activities of comparable control groups in Belgium, Bulgaria, Czechoslovakia, France, East Germany, West German, Hungary, Peru, Poland, the United States, the Soviet Union, and Yugoslavia. John P. Robinson of the University of Michigan was one of the sociologists involved. In the Summer, 1969, issue of the *Public Opinion Quarterly*, he discusses TV-watching in these twelve countries. He points to evidence that in all countries, apparently independently of the total amount of leisure time available and of the different types and quantity of programming offered, the average amount of time spent by the population in viewing television rises at approximately the same rate and in direct proportion to the increase in the number of sets in operation.

At the saturation point, as in the United States—and apparently in Britain and Japan, although they were not among the participating

countries—people sit in front of the “boob tube” for about two hours daily, which in the United States amounts to about 40 percent of their leisure time.⁴ They generally watch, not because they have favorite programs, but because they have nothing better to do. There is little televising in the morning or during the daytime, even in those relatively few countries that have extensive daytime programming.

As for radio listening, in the twelve countries surveyed, this has become almost entirely a “secondary” occupation; people listen while driving their cars, doing the housework, eating, shaving, and so forth. In the countries covered, time spent listening to the radio in 1966 varied from thirty-six minutes a day in West Germany through one hour in the United States and up to an hour and forty-eight minutes in Czechoslovakia.

It is obvious that, at the very least, nighttime radio listening is bound to be affected—has probably already been seriously affected—by the growth of TV in the urban areas of East and West Europe and in Latin America, as well as in Japan, the United States, and Canada. People don't very often watch television and listen to the radio simultaneously. This does not necessarily mean, however, that the total number of people listening to radio is decreasing, or that the aggregate amount of time spent listening to radio is falling off. Nor does it mean, necessarily, that there is less listening to international radio, even in the urban areas affected.

WHO LISTENS TO INTERNATIONAL RADIO?

There were about 370 million radios in the world outside of the United States in 1970; of these, approximately one-third can tune short-wave. There were an additional 275 million sets in the United States, of which only two million could tune short-wave. By 1980, the world's population will have increased by 1.3 billion, while the number of radios—and the number of shortwave sets—is expected to double.⁵ Per-capita radio listening in the United States and West Europe will probably remain steady.⁶ As the transistor revolution continues, hundreds of millions of people who have seldom had access to the radio in the past will begin listening regularly—in the rural areas of Latin America, even in the outback of Siberia and Soviet Central Asia.⁷

As far as Asia and Africa are concerned, with the major exception of Japan, radio will remain communications king during the seventies and beyond. In China, “radio has become a crucial Maoist tool of mobilization.”⁸ The late Gamal Abdul Nasser, as he was launching the remarkable expansion of Radio Cairo, wrote:

It is true that most of our people are still illiterate. But politically that counts far less than it did 20 years ago. . . . Radio has changed everything. . . . Today, people in the most remote villages hear of what is happening everywhere and form their opinion. Leaders cannot govern as they once did. We live in a new world.⁹

Noting United Nations predictions that Asia and Africa have a long time to go before they have enough newspapers and cinemas, Wilbur Schramm writes that "the picture points to the importance of radio in the decade ahead."¹⁰

In considering the future audience of listeners specifically to international radio, it is important to keep a number of factors in mind. Already mentioned is the fact that many international broadcasters cover vast areas with strong medium-wave signals, as well as by short wave. Also important—and this often comes as a surprise to Americans—is the widespread use of short wave outside the United States. Many countries, particularly very large ones like the USSR, China, India, the Congo, and Brazil, make extensive use of short wave for domestic broadcasting, since it constitutes the cheapest means of covering widespread areas. Broadcasting in Indonesia, a land of thousands of islands stretched over three thousand miles of water, is almost exclusively via short-wave. Most would be inclined to think that the cost of 729 hours of English-language programs broadcast via short-wave to North America every week is money down the drain, but even here it is claimed that some one million Americans listen with some regularity and that they are, in fact, influenced by what they hear.¹¹

WHY DO THEY LISTEN?

Signal strength and frequency aside, people listen to foreign radio to get something they don't get from their domestic media. This may be certain types of entertainment, such as Western jazz and pop music. They may listen out of sympathy for political views barred at home, or simply "to get the other fellow's point of view." Major Western broadcasters are convinced, however, that the primary motive is the desire—often the need—for timely, accurate, objective information, which the domestic media of most of their target countries fail to provide. After the 1968 imposition of censorship in Brazil, for example, Agence France Presse reported that the BBC and VOA had become the sole reliable sources of news on events in Brazil itself. "It is not rare in Brasilia," said the AFP dispatch of December 20, 1968, "to see officials desert receptions and return home to listen to the British and American radio." Although scientific surveys are scarce, evidence is sufficient that people in Communist countries will go to the trouble of listening to jammed broadcasts that are only fifteen minutes long in order to get information denied to them by their own media.¹² Other means of international communication can be controlled by government authorities but radio broadcasting, as the BBC's External Services Director, Oliver Whitley, has said, "cannot be confiscated, or refused a visa, or burnt in the public square."¹³

For Communist broadcasters, providing the current line to the party faithful may take precedence over building up a listening audience among those who thirst for objective information.¹⁴ At any rate, available surveys almost always show Moscow, Peking, and other communist stations

trailing far behind Western stations. Of regular listeners to foreign radio in Hungary in 1967, Gallup has reported 64 percent listened to Radio Free Europe, 31 percent to the BBC, 30 percent to VOA, and 16 percent to Radio Moscow. In Poland in 1969, it was 36 percent for VOA, 32 percent for RFE, 31 percent for BBC, and just 1 percent for Radio Moscow. Among college graduates surveyed in East Africa in 1968, the Voice of Kenya had 70 percent, BBC 61 percent, Radio Uganda 45 percent, VOA 36 percent, Radio Tanzania 33 percent, Radio Brazzaville 19 percent, Voice of the Gospel 17 percent, Radio Moscow 7 percent, Deutsche Welle 7 percent, and Radio Peking 2 percent. A general population survey carried out by the German government in Argentina in 1968 shows the BBC on top among foreign broadcasters with 3.4 percent, VOA 3 percent, Moscow 1.1 percent, Deutsche Welle 1 percent, Spain 1 percent, France .6 percent and Havana, Peking, and CBC all .5 percent. Only in India does Moscow do relatively well. According to a 1969 survey of regular listeners to foreign broadcasts, Radio Ceylon had 83 percent, BBC 66 percent, VOA 58 percent, and Radio Moscow 55 percent.

Within government bureaucracies, the debate will doubtless continue as to what audiences their radio operations should try to reach. Some will advance the "elite" theory—called the "target group concept" within the U.S. Information Agency, and described informally by BBC programmers as "the pernicious doctrine of the influential few." Most professionals in the business of international radio will agree that they want most of all to reach the "opinion leaders." But they understand this term in the sense used by sociologists, beginning with Paul Lazarsfeld in the 1940's: that is, not as limited to representatives of the elite and of the media, but as made up of individuals in all walks of life who influence their peers. It is further argued that persons sufficiently motivated to listen to foreign broadcasts are likely to belong to such groups, which include potential leaders not otherwise identifiable. It is this large body of people—estimated at from 10 to 20 percent of the adult population of most countries—that forms "public opinion," a force that has been growing at a quickening pace over the past two centuries. Diplomats, writes Lloyd Free,

do not include in their calculations the degree to which the public all over the world has, in fact, got into the act; nor the extent to which propaganda, popular persuasion, and information and cultural programs have become major instruments of the new diplomacy.¹⁵

HOW INFLUENTIAL IS INTERNATIONAL RADIO?

We have seen that a tremendous effort is going into international broadcasting, and that the audiences are large. But what effect does all this have?

Obviously, there is no pat answer. Don Smith notwithstanding (see footnote 11), it is hard to believe that short-wave broadcasts have had any appreciable effect on the thinking of Americans. But in much of the rest of

the world, international broadcasts may be as influential as local radio, occasionally even more so. In Africa, radio has been "an essential instrument of national development,"¹⁶ and BBC, VOA, and ORTF have all seen it to be in their interest to help propagate this development. Radio is also seen as the "most powerful" and "crucial" weapon in the "war for men's minds" on the dark continent.¹⁷

In Nigeria, Brazil, and India, for example, Everett Rogers found the broadcast media particularly important in the diffusion of innovations. Of the world's largest country, Ithiel de Sola Pool has said:

Most of the things of a positive character that are happening in the Soviet Union today are explainable only in terms of the influence of the West, for which the most important single channel is radio. There is now enough communication to keep us part of a single civilization, to keep us influencing each other, to assure that any Western idea circulates in the Soviet Union, too. The pessimistic expectation that totalitarianism could develop an accepted heinous civilization of its own by 1984 or any other year has been defeated primarily by the forces of communication, and above all by international radio.¹⁸

CONCLUSION

The public for international radio will continue to be a broad one, including a wide spectrum of the intellectually curious. Its influence will vary, depending upon signal penetration, competition of local media, area listening habits, the presence or absence of crisis situations, and other factors. Morning listening will become relatively more important where televiewing has become widespread. The purpose of international broadcasts may shift slightly in the direction of plugging the industries or products of the sponsor country, as has happened in recent years with the BBC and the Deutsche Welle. . . . [The] Director General of the BBC, describes the role of the External Services as "the cultivation of trade and good will."¹⁹ Yet the prime aims will undoubtedly remain political; to win friends, explain policies, break down the other fellow's monopoly on information, and, particularly for "clandestine" operations, support rebel movements and subvert the governments of target countries.

The race to build bigger transmitters and mount more programing becomes increasingly expensive. Yet in the last analysis, the major international broadcasters cannot afford to fall behind. They fear to leave the field open to others, whose interests are less than identical at best and sharply inimical at worst. For the future of international radio it is safe to predict: more of the same.

NOTES

¹ For Europe, North Africa, and Asia. Figures compiled by FBIS and VOA.

² VOA is jammed in Havana, but rather ineffectually. Suspicious interference with Western broadcasts has also been reported in Cairo and Alexandria. The USSR jams Peking's broadcasts in Russian, but China leaves Moscow's Mandarin programs unmolested. China also leaves BBC alone, concentrating on the VOA and the Republic of China's 274 hours a week out of Taiwan in eight different Chinese dialects. In 1963, Khrushchev lifted Soviet jamming of VOA and BBC—not Radio Liberty—but it was resumed within hours of the

invasion of Czechoslovakia on August 20, 1968. Jamming of Western broadcasts in Czech and Slovak was also resumed at that time.

³ Alexander Szalai, "Multinational Comparative Social Research," *American Behavioral Scientist*, 10 (December, 1966). Two volumes of the results of this study are due for publication later in 1971.

⁴ Some U.S. surveys have put the time spent in televiewing as high as three hours daily or even more, but Dr. Robinson has told me that he considers these figures inflated. Various studies by the R-TV Culture Research Institute of NHK, the Japanese national broadcasting system, put the Japanese average at about three hours daily.

⁵ Edgar T. Martin and George Jacobs, "Shortwave Broadcasting in the 1970's," in J.M. Frost, ed., *How to Listen to the World* (Pontllanfraith, Wales; Pendragon Press, 1971), pp. 4-8.

⁶ The *European Broadcasting Union Review* of July, 1970 reports "a general stabilization of the over-all audience with a slight increase in certain countries" and "an upward trend in the early morning."

⁷ According to Radio Liberty, the number of sets in the Soviet Union, exclusive of wired speakers, stood at just 50 million in 1970, or about one to every five persons. Twenty-eight million sets tune to short wave. However, there was a great concentration of sets in European Russia.

PROPAGANDA THROUGH THE PRINTED MEDIA IN THE DEVELOPING COUNTRIES*

BY Y. V. LAKSHMANA RAO

Developing countries fear the introduction of alien and undesirable influences in the form of printed media from the outside world. Unlike the developed countries, developing societies are almost exclusively consumers of international communications, not producers; audience, not communicator. The "flow of communications" is essentially unidirectional in such cases.

* * * * *

THE PRINT MEDIA

Insofar as the printed media in the developing countries are concerned, there are certain specific factors which one can discuss as leading to an international intercourse which is neither planned nor propagated deliberately. It is difficult, in the absence of any systematic study, to point out how much of this international intercourse is "propaganda" and how much is non-persuasive content affecting thought and behavior. To the extent that in many of these countries a relatively free press does exist and that outright censorship does not exist, there is scope for a considerable amount of international flow of information. But there are other factors within the structure of the printed media themselves which lead to a situation where a great deal of non-indigenous material comes in. These factors are worthy of consideration.

The post-colonial era left a number of newspapers in the hands of foreign investors and of expatriate editors and editorial staff who gained their experience during the colonial period. We are not now dealing with those newspapers which printed surreptitiously and perhaps provoked people into rebellion or some other manifestation of an anti-colonial nature leading thereby to independence. We are talking only about those newspapers which were economically viable and which have continued to publish after the countries gained independence. The editorial staffs of these papers have continued, generally speaking, as the "Westerners" did. They have continued to belong to an elite group which is invariably far removed from the mass of the people; they have continued, by and large, to talk a certain "language"—which is usually the language of *The Times* of London or the *Daily News* or the *Daily Express*. These have been the newspapers which the average journalist in the developing countries still tries to emulate, whether or not he has the benefit of the audience of, say, *The New York Times*. This has led to a certain professional conformity which is international. It has also limited their appeal, viewed in the context of communities where broad-based governments

*Excerpts from "Propaganda Through the Printed Media in the Developing Countries," *The Annals of the American Academy of Political and Social Science*, Vol. 398 (November 1971), pp. 93-103. Reprinted with the permission of the American Academy of Political and Social Science and the courtesy of the author.

and political structures are now generally the rule. This has left the newspapers catering only to a small minority, however important that minority may be in the decision-making process.

Another factor leading to such conformity is both economic and professional in nature: the presence of the big international news agencies, and in many ways their stranglehold on the newspapers of the developing countries. It is professional because of the quality and the convenience which these agencies provide; it is economic because most of the newspapers cannot afford to have correspondents in the major news centers of the world. An additional reason is that many of the developing countries cannot afford to have national news agencies of any reasonable size; and even where these exist, such agencies in turn have to subscribe to one or more of the international agencies for their inflow of world news.

The pressure toward "objectivity" and accuracy to satisfy a mixed clientele—including governments, commerce, and industry, as well as news media of varying political beliefs—has already led to conformity among the newspapers in the industrially advanced countries, where it is increasingly common to have only one newspaper in each town. Although not quite to the same extent, a similar situation seems to be developing in other parts of the world. In the absence of human and material resources to support competing newspapers, news agencies, or feature services, the content of newspapers is becoming increasingly standardized.

SPECIALIZED AUDIENCES

In the case of magazines, however, the situation is perhaps slightly better, but only slightly. While these publishers do aim at more specialized audiences—youth, women, the educated elite, the business community, and so on—even they are finding it more convenient and cheaper either to subscribe to syndicated material from abroad or to buy regional rights to publication of new books in serialized form.

Even where book publishing is concerned, it is becoming increasingly common for publishing firms to establish similar relationships with publishers abroad. One need only to go into a book shop or a stationery shop in a developing country to find this uniformity of taste (innate or developed) extending to such things as posters and phonograph records.

Among the widely circulated magazines, *Time*, *Newsweek*, *Life* and the *Reader's Digest* come immediately to mind as those which have special editions for specific regions, with local advertising and well-organized distribution systems. Newspapers like the international edition of the *Herald Tribune*, the *Sunday New York Times*, or the weekly English edition of *Le Monde*, reach the far corners of the earth within a day or two of publication. And books, whether they be *The Death of a President*, *The Ugly American*, or *Candy*, are to be found on the bookshelves of the rest of the world at almost the same time as they reach the homes of Americans.

It is obvious, therefore, that, for good or bad, international intercourse made possible through the ever-expanding channels of communication has indeed led to a certain amount of commonness and uniformity through the printed media, even as it has led to the same result through the non-print media.

One must note, however, that insofar as the developing countries are concerned, this commonness and uniformity, internationally speaking, have so far been generally confined to small minorities—minorities which are well educated and relatively high up in the socio-economic scale. It is only a matter of time before these tastes, these values and beliefs, percolate downward and begin to affect the majorities. This will happen as intra-national communication networks begin to function as effectively as the international channels perform today. The tragedy in many of the developing countries is that it is easier, in both a practical and a psychological sense, for a person in a capital city to communicate with London or Paris or New York or Moscow than with someone in a smaller town or rural community in his own country.

The recognition of this phenomenon in the developing countries has been fairly recent. Fears are being expressed openly by the leaders in these countries that the process has already gone so far that it cannot be reversed. The question now is: should efforts be made in fact to reverse it, or is it the inevitable result of development and modernization? After all, these are, in most cases, the same leaders who only a few years ago not only recognized the need for international intercourse but also insisted upon it. The price, if indeed it is a price, had to be paid. If pressures are growing for a reversal of the process, these pressures are being exerted, by and large, by the senior citizens, to whom such change has perhaps been too rapid for adjustment and too intense for emotional comfort. Where such a feeling of going too far has been felt by the leaders themselves, it is very political in nature, and only social and cultural to a lesser degree. Foreign investment, welcomed in other fields, has been seen as a threat—a political threat—when it impinges upon the media. There has been a growing concern about expatriates owning and/or operating the media, for fear that public sentiment may be swayed in favor of political ideologies repugnant to the basic tenets of the present leaders.

One of the more cogent arguments of the leaders of developing countries today is that political stability is perhaps more important than political philosophy—and especially the freedoms that go with it—and that a country cannot afford the luxury of a clash of ideas or a clash of interests while it is dealing with the more fundamental problems of food and shelter.

As far as the printed media are concerned, the pressure is toward more conformity—not conformity with international standards or international symbols but with national aspirations, with national needs and national priorities, and therefore with national governments. The printed media

therefore are standing today amid a great deal of talk about international intercourse, and are on the brink of disaster, for the very reason that in their shortsighted quest for internationalism—admittedly propounded by their own national leadership at an earlier stage—they are paying the price for neglecting their own national roles.

It has been said repeatedly in the literature of communication that a country's media networks and media content are but a reflection of the country's own structure, its own values, beliefs, and aspirations, and its own stage of development. To the extent that the printed media are in the throes of intellectual ferment, they do reflect the mood of their countries. The media as producers have been found wanting; the media as importers have been shortsighted. By importing material to satisfy their own immediate needs and by not making efforts meanwhile to develop their own production capacities, they are in danger of neither producing nor being allowed to import further.

The implication of such a state of affairs, viewed from an international point of view, propagandistic or otherwise, is frightening. This discussion has dealt with the problem deliberately and almost exclusively from the point of view of the developing countries because the more developed countries have had such intercourse for a long time and have built their own safeguards and their own forms of attack. The United States and the Soviet Union, for example, have worked out a fairly convenient way of exchanging publications, such as *America Illustrated* and *Soviet Life*. The number of copies, the content, and the like, are all fairly well standardized. No overtly propagandistic material is permitted, but each knows what type of content may subtly influence the readers.

The developing countries are new at this game. But they are beginning to learn the rules and it would be a great shame if, because of their own lack of experience and lack of foresight, they were to stop playing the game altogether. Propaganda used in its broadest and healthiest connotation can add greatly to a society's education and experience. The political aspects of it can perhaps be controlled if all parties concerned can achieve some kind of understanding in a spirit of give and take. But to lose sight of the social and cultural advantages accruing from international exchange of information, and so to reject them, is tantamount to throwing out the baby with the bath water.

In his oft-quoted discussion on *Political Propaganda*, Barlett said as long ago as 1940 that

today propaganda is in the air and on it. There is no escaping from its insistent voice. Even were it only half as effective as it is often claimed to be its power would be enormous. . . . It is at work to fashion the education of the child, the ambitions of youth, the activities of the prime of life, and it pursues the aged to the grave.¹

It is this fear of propaganda, right or wrong, that the leadership in the developing countries shares.

EVALUATING FILMS FOR DEVELOPMENT*

BY TULSI BHATIA SARAL

A qualitative evaluation of film effectiveness in communicating development principles.

In order to be able to criticize or evaluate . . . films [in the international development process] we must first be clear in our minds about the goals and purposes we want these films to serve in the process of development.

We must, for example, determine decisively whether we want the films to inform people about what is happening in their villages, or whether we want the films to be consciously used as instruments of change to facilitate acceptance of new ideas. Do we want the films to serve as tools for imparting new skills and techniques, or do we want them simply to provide recreation in the otherwise dull and monotonous life of the village? Are our films to serve the villagers, the elected village leaders, the paid government workers employed for development work at the village and block levels, or the rare elite, usually far-removed from the realities of village-life but unfortunately actively involved in the decision-making processes affecting the very future of the village-community? These, and a host of similar questions need to be posed, thoroughly studied, and satisfactorily answered before any systematic and serious attempt to formulate evaluation procedures for developmental films can be made.

THE EXPECTATIONS

Odd as it may appear, the exact role of films in development has never been clearly specified. All of us engaged in development work all over the world, in our sacred enthusiasm, assume that the communication process is basic to development, diffusion of innovations and modernization, and that if we are to succeed in sparking the expansion of the productivity of underdeveloped nations, we must somehow become more effective communicators. We also assume that of the mass media readily available or commissionable in developing countries, film is the most effective (it has moving pictures, combined sight and sound, has a novel appeal, etc.) and has the potential to cut across the language and cultural barriers.

Without ever caring to test any of these seemingly sound yet vague and rather general assumptions, production units all over the world have been spending vast sums of money turning out movies on development and related topics, and development agencies—governmental, non-governmental, national, international—have been helping finance their large-scale production and distribution in the remotest parts of the world, wishfully thinking that once the people come out of their shells and

*Excerpts from "Evaluating Films for Development," *International Development Review*, VIII, No. 4 (December 1966), pp. 39–41. Reprinted with the permission of The Society for International Development, copyright holder.

expose themselves to these wonderful vehicles of opinion, attitude and behavior-change, they will feel inspired to change their outlook if not their living habits, and the task of development will be that much easier.

THE FAILURES

To our great disappointment, however, the miracle does not happen. After successive screening of hundreds of brilliantly produced works of art, which invariably draw large audiences whenever and wherever screened, the message of development does not seem to be getting across—people, somehow, do not seem to be changing their attitudes and behavior in the desired direction. What is more frustrating is that we do not know where our failure lies because we never knew what we wanted our films to achieve to begin with.

Is it because most of the available films, originally produced for a specified audience, are shown indiscriminately to any available audience? (This seems doubtful, because most of the films, unfortunately, are not produced with a specific audience in view.) Is it because the content of the films is too technical, too complex, too obviously propaganda-oriented that the audience turns off its receptivity at the very outset? (An Indian villager, for example, does think of efforts at propagating developmental activities as propaganda but nevertheless exposes himself to such media. Obviously, the villager expects from these media some entertainment value. In the case of a movie, it is a moving picture and he can see people and things in motion—very often people with whom he can identify and things which he can recognize.) Or is it that our basic assumption that movies cut across language and cultural barriers is invalid—maybe they don't; maybe every geographic region and every cultural region employs and understands a completely different visual language—a completely different film-language, if you please. It may be that certain meanings or messages in a particular region communicate an entirely different and irrelevant meaning or message in a different region or culture!

We know, by now, that the simple skeletal diagram of communication, SENDER—MESSAGE RECEIVER, is not a valid representation of how communication works. (If it were, the task of rural development would be vastly easier than it is!) There are, in addition, the questions of audience-predisposition, self-selection, and selective perception. We have been forced to realize that mass communications as such are not really powerful enough to bring about significant changes in deep-rooted attitudes or widespread adoption of new practices. Functioning simultaneously (sometimes reinforcing and sometimes retarding or counteracting) are a host of other important factors such as the audience's image of the source of communication, the group-orientation of the audience-members and the degree to which they value the group-membership, social aspects of the content of communication, and so on. As of now, we have no way of formulating any systematic description of what effects are effected how,

or of determining the role and weight of one or more of the many potential factors in such a process.

An important facet of the role of communication is its relation to the growth of popular aspiration toward betterment. Unless the desire for change and for appreciably higher living standards takes root in the peasant communities, new techniques from outside will not be accepted or exploited fully. Unfortunately, however, development in most countries is a government responsibility, and many of the developmental agencies—particularly the international organizations—largely base their development efforts on the governmental assessment of plans, priorities and people's aspirations. Often, such assessments are either far removed from the real aspirations of the people, or are unrealistically overenthusiastic. No wonder films made to fit such a framework fail to trigger the motivation of people to change.

SOME COMMUNICATION CLICHES

It is fashionable today to say that any communications program, to be successful, must carry information that is "local" in character, is acceptable and understandable to the village people and is relevant to the problems that villagers themselves sense as problems serious enough to warrant action toward their solution. It is more easily said than implemented that communication must consider local traditions, habits and beliefs that should not (or cannot?) be shaken. The real problem arises when an attempt is made to translate such seemingly simple and straightforward propositions into action, because we have no objective criterion by which to determine the "localism" of a particular piece of information or problem, nor do we know where to draw a line between the traditional beliefs that must be given up and those which may be blended with, or can perhaps co-exist with, the modern belief systems.

NEED FOR THOUGHTFUL ACTION

The need is to define more precisely the prevalent terms and describe more explicitly the relationships we assume to exist between various facets of communication and development. This relationship between communication and development in all its aspects is a field of study with relatively recent origins; and so far, conscientious and well organized use of media, based on behavioral patterns and on sociological and psychological factors relating to individuals and groups, has not been made in the field of development. The film section of this *Review* can make a vital contribution by pinpointing blind spots in this field and by specifying directions for immediate research attention. A beginning can perhaps be made by compiling a bibliography of available evaluation reports of mass communications in general, and films in particular, in the process of development, in order to facilitate the pooling of knowledge and speedy exchange of experience. A systematic effort may perhaps then be made to propose some exploratory studies, to probe, to test, and to stimulate

more rigorous research on relationships between variables that come into play in communications and development.

EFFECTS ANALYSIS

The effects of persuasive communications are particularly difficult to ascertain because in practice it is usually impossible to isolate the cause of observable results. To discover 100 enemy troops defected within a certain time after a direct appeal to do so does not prove the appeal had anything to do with the defection, and certainly not that the appeal was the defection's primary cause.

Clearly, then, the major need in effects analysis—and to a somewhat lesser extent in the SCAME categories—is the isolation of appropriate methodologies to measure effect or at least assist in its determination. The first essay, by Lieutenant Colonel R. P. Morris gives some idea of the diversity of approaches currently used by Army personnel to measure effect and effectiveness. His article is based upon survey research as well as an extensive literature search.

The second and third papers illustrate methodologies used or recommended by various researchers for the evaluation of effectiveness. Similarly, Joseph G. Whelan's essay demonstrates the techniques used to determine effect by a source involved in political communications with an audience to whom the communicator does not have unimpeded research access.

Donald D. Smith's essay on the effects of Moscow's short-wave transmissions to North America is interesting in terms of both methodology and findings. The article illustrates that audience predispositions may bring about the *success* of international communications even when other conditions presumed necessary for effectiveness are lacking.

PSYCHOLOGICAL OPERATIONS IN VIETNAM: INDICATORS OF EFFECTIVENESS AT THE U.S. ARMY DIVISION LEVEL*

BY R. P. MORRIS

A review is made of the numerous indicators of effectiveness used by the U.S. Army in the Vietnam era.

This study reviews the types of PSYOP indicators employed by Army divisions in South Vietnam and suggested by Army personnel at the U.S. Command and General Staff College.

CASE STUDIES

*Excerpted and adapted from "Psychological Operations in Vietnam: Indicators of Effectiveness at the Division Level," student thesis, U.S. Army Command and General Staff College, Fort Leavenworth, Kansas, 1969, pp. 34-93. Reprinted with the permission of the author.

I. 1st Infantry Division

In the 1st Infantry Division a total of seventeen PSYOP feedback indicators of effectiveness were identified. These indicators ranged from quantifiable direct indicators, such as the number of *Hoi Chanh* (returnees to Government of Vietnam control from VC/NVA ranks) per month in the division area of operations, to subjective indirect indicators, such as conversations with the division Vietnamese Army Liaison Officer and attached Vietnamese Army interpreters.

The indicator given the greatest significance during 1968 was the Chieu Hoi (Vietnamese Government Open Arms Program) rate.¹ The rate was figured on the number of ralliers per month in the division area of operations. This indicator was considered to be significant because the main thrust of the division PSYOP effort was directed toward causing members of the enemy forces to defect from their own units and to rally to the side of the free world forces. A related indicator utilized by the 1st Infantry Division was interrogation information obtained from among ralliers in the division area. Another indicator was the "mass rally rate," or the frequency in which multiple ralliers from the same enemy organization defected to the allied side together.

Two other statistical PSYOP indicators used by the division that are related to the Chieu Hoi Program are: (1) the rate of ralliers per month who turn themselves over to U.S. units rather than to Vietnamese officials,² and (2) the number of ralliers who volunteer to serve with the division in the "Kit Carson Scout Program."³ The Kit Carson Scout data is considered significant from a PSYOP viewpoint because the participation in the program reflects not only defection from the Viet Cong/North Vietnamese Army ranks, but reflects complete reversal of loyalties to the point where the rallier takes up arms against his former comrades in an active and hazardous manner.

According to PSYOP doctrine, one of the functions of tactical PSYOP is to reduce interference by civilians with tactical operations. The extent to which PSYOP accomplishes this function is judged by the next indicator used by the division, which is "direct observation." The extent to which people in the target audience follow instructions (often simple administrative instructions) broadcast from an overhead PSYOP helicopter can usually be observed directly from the helicopter by the PSYOP crew aboard. A variation of the direct observation indicator by U.S. troops on the ground is used to check the technical effectiveness or the operational capability of the electronic broadcast equipment aboard PSYOP helicopters. On certain operations where U.S. troops are known to be on the ground in the close vicinity of the ethnic target audience, a control message is often broadcast in English so that the U.S. troops can provide rapid feedback as to the technical effectiveness of the electronic equipment.

Another important effectiveness indicator used by the division is feedback information from prisoners of war.

The division participates in a combination intelligence and PSYOP

program known as the Volunteer Informant Program. In return for voluntary services, the people may be compensated with money, rice, or other commodities. The resultant effectiveness of these efforts is indicated by the number of informant tips received, the number of weapons turned in, and the frequency of other positive services rendered to the friendly forces by the people in the target audience.

Captured enemy documents are used as indicators of PSYOP effectiveness because they sometimes contain specific information concerning enemy reaction to PSYOP broadcasts and leaflet drops.

Two additional indicators of effectiveness that originate outside the division, but relate to the division PSYOP effort, are: (1) the monthly reports of province senior advisors, and (2) periodic civilian attitude reports from the province advisory staff.⁴

The number of Medical Civic Action Project (MEDCAP) patients treated per month is considered to be a direct PSYOP indicator. A variation of this indicator is the number of dental civic action project (DENTCAP) patients treated per month; however, the figures are usually consolidated into a single MEDCAP figure that includes both the medical and the dental patients.

Another direct PSYOP indicator is the attendance rate at division-sponsored movies provided for the benefit of local audiences. These movies are publicized by PSYOP media and the attendance at the movies is considered to be "responsive action" on the part of the target audience; hence, this data qualifies as a direct PSYOP indicator under the criteria set forth in the official field manual on PSYOP doctrine.

Another PSYOP effectiveness indicator is the monthly "Hamlet Evaluation System" report which shows the percentages of hamlets that are considered to be pacified in degrees ranging from unsecured to secured.

The final PSYOP indicator revealed by the data on the 1st Infantry Division is an indirect indicator. This indicator concerns specific VC/NVA PSYOP actions directed against the division PSYOP efforts.

In summary, the 1st Division case study has produced a total of seventeen different PSYOP indicators of effectiveness that are or have been used by the division in evaluating the results of its PSYOP effort.

II. 1st Cavalry Division (Airmobile)

The data examined concerning the 1st Cavalry Division yielded eight major PSYOP indicators of effectiveness. Of these eight indicators, six were the same or were variations of indicators that were also identified in the 1st Infantry Division case study.

Of the two new indicators developed, the first one was "voluntary surrender broadcasts" or "quick reaction messages" broadcast by ralliers to their VC or NVA units.

The other new indicator developed from the 1st Cavalry Division study consisted of incidents in which the enemy fired upon PSYOP helicopters broadcasting messages.

III. 4th Infantry Division

Fifteen indicators of PSYOP effectiveness were identified in the 4th Infantry Division. Seven of the fifteen indicators were not mentioned in the studies of the 1st Infantry and 1st Cavalry Divisions.

Of the seven new indicators, one was "results per dollar cost," and the other was "results per manpower unit." An internal staff study found the average monthly cost of the 4th Infantry Division PSYOP program to be \$19,420 and 11.5 or 12 manpower spaces. To complete the ratios, results were quantified in terms of *Hoi Chanh*s who had rallied in a given time period and the number of items of intelligence value reported to the division during a given time period.

Weather conditions were also cited in the 4th Infantry Division as a subjective indicator. The damp, soggy conditions brought about during the wet monsoon season work against PSYOP effectiveness by limiting loudspeaker ranges and by reducing the legibility of paper leaflets lying on the ground in the jungle. On the other hand, the rainy monsoon season works for PSYOP effectiveness by creating less desirable living conditions for the VC/NVA forces and thus possibly making the target audiences more susceptible to allied PSYOP efforts.⁵

Another subjective indicator of PSYOP effectiveness that was cited in the 4th Division was "status of enemy medical care."

Similar to the reports received concerning the status of enemy medical care, was another closely related subjective indicator. This indicator consisted of interrogations which directly reported upon the state of morale within the enemy ranks.⁶

The 4th Infantry Division disseminated a two-to-four page news leaflet by air drop to suspected enemy areas. The leaflet was named *Binh Minh*, a Vietnamese phrase which means "First Light." The PSYOP indicator in this situation was the number of *Binh Minh* clippings found on the bodies of enemy troops.

Another different indicator that was developed through the 4th Division study was "JUSPAO analyses of VC propaganda." ⁷ This indicator is subjective and is based upon a series of periodic field memorandums published by the Joint United States Public Affairs Office in Saigon. This indirect indicator of PSYOP effectiveness is unique in that it is based on material developed at the national level from which information can be extracted that pertains to the local division area of operations.

IV. 101st Airborne Division (Airmobile)

The study of the 101st Airborne Division revealed seven PSYOP indicators of effectiveness, of which three had not been mentioned previously in this research project.

Probably the most unusual example of PSYOP effectiveness in the 101st Division was the incident in which PSYOP was used successfully to aid in the repatriation of forty Vietnamese Government troops who were being held captive by the Viet Cong in a prison compound. In the confusion following a raid on the prison compound, the prisoners scattered into

the surrounding jungle areas. It was only after the airborne PSYOP loudspeaker reassured the repatriated prisoners as to their safety that they were successfully brought back under friendly control.

The three indicators which had not been mentioned previously in this study were: (1) the repatriated prisoners' response to PSYOP, (2) the verbal surveys conducted by the armed propaganda teams, and (3) the monitoring of the tactical operations of target groups.

V. Americal Division

In the Americal Division a total of nine PSYOP indicators of effectiveness are utilized. These indicators were identified in a letter from the Division Assistant Chief of Staff, G5, Lieutenant Colonel Norman L. Robinson, dated January 5, 1969. The nine indicators used by the Americal Division are common to the other divisions previously discussed.

VI. 9th Infantry Division

No letter response was received by this investigator from the 9th Infantry Division; however, some data was available from other sources, and six PSYOP indicators were identified. These indicators generally follow the pattern of those mentioned most frequently in the studies of the other U.S. Army divisions in Vietnam.

VII. 25th Infantry Division

The data available on the 25th Infantry Division revealed seven PSYOP indicators of effectiveness. All seven of these indicators have also been identified in the *modus operandi* of other divisions in Vietnam.

COMMAND AND GENERAL STAFF COLLEGE (CGSC) SURVEY

The approach to the problem in this research study was the consideration of two major batches of data—division case studies and a survey of Command and General Staff College (CGSC) students. There were eight PSYOP indicators of effectiveness mentioned by multiple respondents. The indicators most frequently cited by the respondents and the percentages of same are shown in Figure 1.

Of the eight indicators mentioned by multiple respondents, all but two indicators had been developed in the case studies of the divisions. The two new indicators were the following: (1) number of desertions in enemy ranks reported per period of time, and (2) the number of prisoners captured per period of time.

There were fourteen other PSYOP indicators mentioned by respondents only a single time. These additional indicators covered a relatively wide range and included six indicators that had not been mentioned previously in the study. The six new indicators were: (1) attitudes and behavior of Vietnamese civilian laborers employed on U.S. base camps, (2) frequency of enemy rocket/mortar attacks against division base camps, (3) number of "high impact" Vietnamese patients treated successfully by division surgeons (medical conditions remedied in a dramatic manner with resultant favorable psychological impact, such as correction of cleft palates, removal of cataracts, quick cures of advanced pneumonia with massive doses of antibiotics, correction of crossed-eye conditions,

Figure 1. PSYOP Feedback Indicators Identified by Multiple Respondents.

and treatment of remedial blindness), (4) number of Vietnamese patients voluntarily participating in the in-patient hospital care program at the division headquarters base camp, (5) frequency of enemy incidents directed against U.S. division medical personnel operating among the Vietnamese local populace in enemy-dominated or contested areas, and (6) data obtained through in-depth conversations by specially trained U.S. division personnel.

ANALYSIS OF THE DATA

This report [has been] concerned with the examination of data available from the division case studies and the CGSC survey. From these two groupings of data [36] feedback indicators of PSYOP were identified.

I. Central Patterns

It was found that the indicators that were identified and developed in this study could be arranged into six general categories. These categories were: (1) Chieu Hoi statistics, (2) intelligence from interrogations, (3) intelligence from captured documents and intercepted messages, (4) observations, (5) enemy counter actions, and (6) miscellaneous. Of these general categories, there was sufficient data to justify further division of three of the general categories into specific subdivisions.

The "interrogations" group was further divided into interrogations of: (1) prisoners of war, (2) detainees, (3) members of the local populace on a voluntary basis—Volunteer Informant Program, (4) *Hoi Chanhs*, and (5) intelligence agents.

The "observations" group was subdivided into observations by: (1) U.S. PSYOP teams—in the air or on the ground, (2) U.S. troops on tactical operations, (3) province advisory team personnel, and (4) Vietnamese officials at the province and district level within the tactical division area of operations.

The "enemy counter actions" group was subdivided into: (1) enemy broadcasts—both by radio and by local ground mounted loudspeaker systems, (2) leaflets distributed in and around U.S. division areas, (3) enemy roadblocks and tactical operations in the U.S. division areas, and (4) enemy restrictions placed upon their own troops against reading or listening to U.S. propaganda messages and literature.

All of these indicators are shown, by major groupings, in Figure 2, in which the various indicators from the division case studies and the CGSC survey have been synthesized into a single figure. From an examination of this figure, it can be seen that these groupings do reflect the central tendencies. The "Chieu Hoi statistics" and the "interrogations" categories were the most frequently identified indicators, followed closely by the "enemy counter actions (leaflets)" and "miscellaneous" categories.

It was also noted that there was a definite mutual pattern of support between the general indicators developed within the division case studies and by the CGSC survey. This pattern of support existed within all six of the major categories of PSYOP indicators.

II. Evaluation of Indicators

It was found that "Chieu Hoi statistics" were universally used by the U.S. Army divisions in Vietnam as an indicator of PSYOP effectiveness. This indicator lends itself to this purpose particularly well because the data involved can be readily presented in a quantitative form on a briefing chart or in a report to higher headquarters or to other interested agencies. A weakness of this indicator is that misleading statistics can be easily developed unless a careful, accurate, and honest reporting system is used. In situations where more than one U.S. division is operating within a given Vietnamese province, it is possible that each division could report the same province Chieu Hoi center returnees solely within its own totals for a particular month, rather than pro-rating the numbers or using some other system that would approximate the truth. Another weakness of the Chieu Hoi statistic is that in the enthusiasm for meeting quotas or exceeding the results of a previous reporting period, the staff officers concerned may simply accept each feeder report without question and simply add the new numbers to the old. This type of accounting can lead to duplication of data and inaccurate reporting of the totals, for a given *Hoi Chanh* might be reported by a subordinate unit as one rallier on a particular day to that unit; later this same rallier might be reported again as a new acquisition by the local province Chieu Hoi center. Therefore, it can be seen that a careful and valid accounting system is necessary if the Chieu Hoi data is to be meaningful, and great care must be taken to identify specific *Hoi Chanh* by name and by other specific identification means in order to preclude fallacious or ambiguous reporting.

The "interrogations" PSYOP feedback indicators provide quantitative and subjective information for the PSYOP analyst. The division case studies and the CGSC survey reflected wide use in Vietnam of interrogations, particularly interrogations of people under the "Volunteer Informant Program" and interrogations of *Hoi Chanh* personnel. The numbers of individuals interrogated successfully can be quantified. The amount of munitions, the number of weapons turned in, the number of mine and booby trap locations, and the number of intelligence tips of value received can be quantified and used as a numerical yardstick of effectiveness in a relative manner. But, as was pointed out by Colonel Bambery, former G5 of the 1st Cavalry Division, in his letter to this investigator, there is an inherent "desire to please" that characterizes people within the oriental races, and this desire to say what the questioner would like to hear is a factor that must be taken into account when making subjective evaluations of PSYOP feedback information obtained through interrogations.⁸

With respect to participants in the Volunteer Informant Program and individuals acting as regular intelligence agents, there is the element of "payment for services rendered" involved in the interrogations. The informants (the informants who are being paid for their information) have a product to sell and it would be natural to assume that such informers would be eager to please their benefactors in the hope of making even

more money. When the primary motivational factor becomes money, then it seems that the indicators of PSYOP effectiveness thus produced must not be accepted purely at face value. These indicators must be evaluated in a careful manner or there is the possibility that information provided may be somewhat less than accurate, less than objective, and less than completely reliable. Even if the intent of the informer is sincere, the information may be of doubtful veracity because of the qualities of the various sources along the reporting line.

Another disadvantage of interrogations as a source of indicators is that in many cases the information must be obtained through the use of either Vietnamese or U.S. interpreters. Therefore, the quality of the information obtained through interrogations must be tempered and assessed in terms of the qualifications and reliability of the person who interprets and translates the thoughts from one language to another. Colonel Wolfred K. White, in his article in *Military Review*, "Interpreter—or Filter?" has examined this problem and has cited the pitfalls inherent in the use of interpreters in the less developed countries of the world. Colonel White has explained the situation in the following terms:

Nothing can replace the person-to-person exchange of ideas in a language common to both individuals. At best, the interpreter is a substitute for no communication at all.

The interpreter's lot is not a happy one. His task is demanding, his responsibilities are great, and too frequently his reward is scant. The interpreter's abilities are determined by a number of factors including:

Detailed knowledge of the formal aspects of the languages in which he is working.

Command of the idiomatic expressions in each language.

Technical vocabularies applicable to the interpretive situation.

Ability to convey accurately the tone, spirit, and nuance of each speaker.

Native intelligence.

It is infrequent that the military advisor is fortunate enough to acquire an interpreter possessing all of these qualities in adequate measure. In most instances, he is forced to settle for less—much less.

.....
One of the most frequently expressed complaints of the advisor concerning his interpreter is the real or imagined reluctance on the part of the interpreter to convey criticism, bad tidings, or censure.⁹

Although Colonel White's remarks are directed specifically at situations involving advisor-counterpart relationships, it seems that the thesis he presents would apply equally to interrogations of prisoners, detainees, volunteer informants, or any conversation or communication between U.S. personnel in tactical units and members of the indigenous cultures.

The obvious alternative to the problem of unreliable interpreters might be to dispense with native interpreters entirely and to conduct interrogations using only highly qualified U.S. personnel who are fluent to the highest degree in the local dialects. But, people with the requisite language skills are in short supply within our armed forces, in spite of efforts to train personnel in the service schools. Colonel White has summarized this paradox as follows:

INDICATORS		DIVISIONS					CGSC
		1st Inf	1st Cav	4th Inf	101st Abn	Amer- ical	CGSC

Figure 2. Central Patterns—Division Case Studies and CGSC Survey.

... At a time in our history when we have the greatest requirement for citizens capable of speaking a wide variety of foreign languages, we are discovering the difficulty of developing rapidly these required skills.

Undoubtedly, the lack of U.S. advisors adequately trained in the language of the host country has frequently caused misunderstanding, impeded progress, and complicated the task of aiding emerging nations.¹⁰

Captured documents and intercepted messages are another indicator of PSYOP effectiveness that has been used by U.S. tactical divisions in Vietnam. This indicator has also been cited in the CGSC survey. The number of documents and messages processed that allude to PSYOP effectiveness can be quantified; however, it seems that the same disadvantages that have been mentioned concerning the evaluation of information through interpreters can be equally applied to the evaluation of

captured documents and messages. Whether the translator is a native of Vietnam or whether he is a U.S. native, there is the pitfall of "filtering" or of unintentional misrepresentation of the facts or data contained in the documents or messages processed. If a division has a highly developed intelligence capability, then it would seem that the problems encountered with interrogations and translations would be greatly ameliorated and the two indicators, "interrogations" and "captured documents and intercepted messages," would become significantly more valid.

The "enemy counter actions" indicator seems to have gained general acceptance in Vietnam. Enemy leaflets were mentioned most frequently as the medium of action. Since the leaflets directed against the U.S. troops are written or printed in the English language, the interpreter/translator problem is of no consequence. However, the value of this indicator would probably depend upon the availability of adequately trained personnel within the division resources who could properly evaluate the meaning and exact underlying significance of the messages and broadcasts, *vis-a-vis* judging the effectiveness of the corresponding U.S. PSYOP activity that may have had a direct or indirect bearing upon the enemy side producing a particular counter action.

The "observations" indicator of PSYOP effectiveness was the one mentioned less frequently than any of the other indicators. This situation may be due to the fact that PSYOP personnel and other U.S. and GVN personnel are so close to many activities that have PSYOP significance that the observations of the effects are missed in spite of the close proximity. Another way of expressing this thought is by reference to the saying that often one "can't see the forest for the trees."

Direct observation is a technique that avoids the pitfalls inherent in the use of interpreters, translators, and third-party persons involved in intelligence networks. It is believed that this indicator has merit in that results should be forthcoming with relatively little on-the-job training or experience. An enlisted specialist aboard a PSYOP helicopter should be able, it would seem, to observe directly whether or not the populace of a local village is moving to a designated assembly point as may have been directed in a previously broadcast message from the PSYOP helicopter loudspeaker system. It appears that U.S. troops, officers and enlisted personnel on the ground, should certainly provide feedback information concerning the quality of English language "test" messages broadcast to check whether the electronic communications equipment is functioning in an audible and intelligible manner or not. Certainly, it would seem, the local U.S. advisor teams at the province and district level, who are in daily contact with the local people, could provide observations concerning behavior of the local populace. The corresponding GVN officials could provide information concerning behavior and attitudes through channels and directly to U.S. division PSYOP or G2 personnel. It may be that because the PSYOP function is relatively new to many U.S. division staff officers that the possibilities of direct observation as an indicator of PSYOP effectiveness have not yet been fully explored.

The "miscellaneous" category of PSYOP effectiveness indicators seems to have merit because the indicators reflect the imagination and development of many different individuals and organizations. The apparent disadvantage of the indicators in this category is that most of them are not generally known to the operators in the field. The fact is that these miscellaneous indicators have been identified by individuals and organizations that have been professionally associated with U.S. divisions in Vietnam. Collectively these indicators reflect a relatively large amount of thought and experience.

As with any other indicators or yardsticks used by any sort of analyst, unless the indicators are employed with care and a certain degree of subjective judgment, their usefulness to a commander at the tactical level of operations can be lost. Judiciously utilized, these indicators have served as useful tools in the management of PSYOP and tactical resources in the Vietnam environment.

MEASURING THE EFFECTIVENESS OF AN OVERSEAS INFORMATION CAMPAIGN: A CASE HISTORY*

BY LEO BOGART

A survey demonstrates the proposition that a short-term information campaign is more likely to provide people with a rationale for reinforcing their existing beliefs and attitudes than for changing them.

* * * * *

The attempt to measure communications effects in the field has been most frequently made in the subject areas of politics and marketing, where the stakes are high and where substantial research budgets can be met. In their studies of the 1940 and 1948 election campaigns Paul Lazarsfeld, Bernard Berelson, and their associates, relate changes in voting intention to mass media effects (among other things).¹ Large

corporations have sometimes made similar studies of the effectiveness of advertising or marketing campaigns, but these remain unpublished.

Two notable community studies have utilized the familiar scheme of interviewing cross-sections of a population before and after large-scale public information efforts. In Cincinnati in 1949, Shirley Star and Helen Hughes found that the effects of an information campaign on behalf of the United Nations were untraceable in the light of the problems which the organization itself faced during the same period.² A study of a venereal disease information program in Columbus, Ohio, made by the Bureau of Applied Social Research, also showed disappointing results. Those who were most apt to expose themselves to VD were least apt to expose themselves to the media which carried information on the subject.³

The present study is presented as a case history in the same area of research. It was planned not with theoretical objectives in mind but with the immediate objective of evaluating a test campaign.

BACKGROUND OF THE STUDY

The communications campaign in this case was conducted in Greece in the later part of 1952 as part of the U.S. information program in that country. The U.S. Information Agency has used a wide variety of communications techniques; the test campaign represented an experimental use of paid newspaper advertising as a means of conveying ideas to a wide overseas public. A series of 14 advertisements was prepared for insertion in Greek newspapers and a booklet, "The March of Freedom," was offered free to the readers of the ads. The appearance of the advertisements, both in their size and styling, was such as to make them stand out in the newspaper.

The research was organized and timed as an integral part of the campaign itself.⁴ The objectives were to determine (1) whether or not these materials succeeded in attracting the attention of a wide popular audience; (2) what kinds of people they reached; (3) what the readers thought of them; (4) what kinds of information the ads and the booklet managed to convey to their readers; and (5) what political attitudes they modified, if any.

The newspaper advertisements aimed to create or reinforce the conviction that the U.S. and Greece are joined together in the cause of freedom and that their common ideals are those embodied in the Universal Declaration of Human Rights. The advertisements used large photographs and brief texts to illustrate and discuss the rights enjoyed by citizens in a democracy.

These freedoms were visualized in terms of the "rights of children" which might be expected to gain warm acceptance virtually everywhere. The underlying point of view is expressed in the following quotation from one of the ads:

We believe it is important to the U.S.A. that this child and every child in every land shall have these basic human freedoms.

We believe this because we deeply love the freedoms we are building in our own life . . . and we know that our own freedoms are not fully safe until freedom is safe for anyone, born anywhere.

This does not mean, of course, that we want Greece and other countries to try to be like the U.S.A. Each free people will always have its own way to build its own use of freedom.

But the goals we seek are common.

Emphasis in the ads was not on the present *threat* to freedom; only the last ad in the series referred directly to the Soviet Union and the "cold war." They were, rather, focussed on the positive aspects of human liberty.

One ad mentioned the Declaration in its headline, and another focussed on the booklet offer. All the rest referred to individual rights, covered in nine of the Declaration's Thirty Articles. All the ads except one featured large photographic illustrations of children.

"The March of Freedom" was a 32-page booklet illustrated with two-color drawings which showed significant stages in the development of human rights from Hammurabi's Code to the United Nations. It contained no direct references to Communism. Its objective was rather to show the historical continuity of the democratic tradition.

Between November 16, 1952, and January 3, 1953, the 14 advertisements were run on a twice-a-week alternating schedule in all four Salonica newspapers.⁵ (These papers claim a combined total daily circulation of about 50,000.) Every ad appeared once in each paper, but no ad ever appeared in more than one paper on the same day. Approximately 17,000 copies of "The March of Freedom" booklet were distributed by the U.S.I.S. Library in Salonica directly and by mail.

METHOD OF STUDY

The study was designed to permit comparison of the attitudes of a cross-section of adults in Salonica, who were interviewed shortly before and again immediately after the advertisements ran in the press. To overcome any possible "panel effect," the second wave of interviews (after the ad campaign) was conducted not only with the *same* people who had been in the original sample, but also with *another* parallel cross-section of the population, a sample whose members had not been interviewed previously.

Changes in opinion between the first and second survey periods might have occurred quite independently of the advertising campaign, through the impact of world events or of political developments in Greece.⁶ For example, attitudes toward the United States might have become more favorable between the first and second wave of the study because of a general improvement in opinion throughout the country rather than as a result of the ad campaign. Or opinion might have remained about the same in Salonica, while it became less favorable elsewhere in Greece (that is, the ads might produce their effect not by *improving* attitudes but by preventing a decline which was evident elsewhere).

To take these possibilities into account, a simultaneous before-after survey had to be run in *another* Greek city in which no advertising or

information campaign was conducted. In the control city selected, Patras, two identical random samples (consisting of separate individuals) were interviewed in two waves corresponding with the two waves of the Salonica survey.⁷ The survey was completed by the addition of a special sample of persons in Salonica who had sent or called for "The March of Freedom" booklet at the U.S.I.S. Library. The first wave of interviews took place between September and October, 1952. The second wave took place immediately after the ad campaign ended, during the week of January 4-11, 1953. A total of 2,238 interviews was conducted.

* * * * *

THE CLIMATE OF OPINION

To understand what the ad and booklet campaign accomplished we must first look at the *existing* pattern of public opinion and information which the campaign sought to influence. We must also note the points on which opinions in the test city and in the control city (Patras) were similar and different.

Economic problems were most on people's minds at the time of the survey. . . . With such a focus of attention, other subjects received relatively few mentions. Virtually no one discussed the threat of Communism. . . . It appears therefore that the U.S. information campaign, centering as it did on *political* rights and freedoms, faced a challenge in the form of a widespread public preoccupation with the immediate day-to-day problems of making a livelihood.

In answer to the question, "Does the attitude position of a little country such as Greece influence the future shaping of international events?," the great majority of those answering said that Greece's attitude mattered a great deal. Most of the answers stressed Greece's strategic geographic position, and its potential importance as a military base.⁸

* * * * *

In both cities, Communism's growth was attributed much more often to a national movement caused by economic conditions than to Russian stimulation. In Salonica this was the prevailing opinion by a larger margin (39 percent, as against 12 percent) than in Patras (42 percent against 28 percent) perhaps showing greater Communist influence in the larger city.

Although many Greeks thought Communism arose independently of Russian imperialism, this by no means placed them in the Communist camp. The survey findings showed the United States to be the most popular and respected nation in Greek eyes, while the Soviet Union was widely criticized and disliked.⁹

* * * * *

The preponderant hostility toward the Soviet Union took the form of a general belief that Soviet power was on the wane. To the query, "Ten years from now do you think Russia will have increased or decreased its following among other nations?," virtually all of those replying said that Russia would decrease her following, and almost everyone said this was a good thing. Conversely, the overwhelming majority said the United

States would increase its following in the next ten years and that this was good.

Over-all feelings toward the U.S.A. were described as being *very* favorable by most of the respondents (more so in Salonica than in Patras). . . . The generally favorable outlook toward America was reflected in an overwhelmingly affirmative response to the question, "Do you think the U.S. is doing all it can to help Greece?" and in a strong belief that the U.S. wants to help Greece remain free and independent rather than to dominate it.

Although the ultimate purpose of the U.S.I.S. campaign was to influence opinion, its immediate objective was to increase knowledge of democratic rights and freedoms. How much awareness existed to begin with?

When respondents in both cities were asked to name the rights and freedoms which citizens enjoy in a free country, their response was similar, with freedom of opinion and expression far in the forefront, and references to working men's rights strong in Patras. An average of 1.4 rights was mentioned in Patras, and 1.1 rights in Salonica; 18 percent and 27 percent were unable to name any rights at all.

The Universal Declaration of Human Rights which was emphasized in the ads and booklet was unknown to all but a tiny minority. In the interviews made before the campaign began, 8 percent (P) and 26 percent (S) claimed to have heard of it, but only 2 percent (P) and 6 percent (S) were able to explain what it was. The democracies rather than the Communist countries were named as the ones who signed it. In other words, the campaign was designed to inform its audience on a subject with which they were not too familiar. There was considerable room for expanding knowledge of democratic freedoms in general, and of the Declaration of Human Rights, in particular.

THE INFORMATION CAMPAIGN AND ITS AUDIENCE

The campaign was based on the assumption that newspaper advertising is an effective means of reaching the public in Greece, as it has proven to be in the United States, though Greek newspapers do not have the mass circulation of the American press. In Salonica, for instance, the four daily papers, with a total city circulation of 21,000 must serve the needs of 300,000 residents (about 190,000 adults over 18) in the city, and additional thousands in the surrounding region.

However, . . . it may be estimated that in Salonica each copy of the newspaper reaches approximately five adult readers represented by pass-along readership, reading in coffee houses, and the practice of paying the news vendor a small sum for the privilege of looking at the paper. About one in five in the sample proved to be illiterate.

How many people were reached by the ads and the booklet? How did they react to what they read? Were people who had not been directly exposed to the campaign aware of it in any way? These questions were answered by the second wave cross-section of Salonica residents who were interviewed after the campaign. Their answers closely parallel

those given by members of the panel who were interviewed on both waves.¹⁰

The ads were seen by a large proportion of the reading public. . . . All but a handful of those who said they had seen the ads associated them with the United States. Four out of five of those who said they had seen the ads could answer a question on the main point.

Readership of the ads was estimated in two ways: (1) by asking the respondent directly how many ads he had seen, and (2) by actually taking him through the ads one by one, in each case asking whether he had previously seen it or read it.

* * * * *

There were notable differences in the degree to which various groups in the population came into contact with the campaign. Since literacy was higher among men . . . than among women, . . . men read more newspapers every day. . . . More of them, therefore, claimed to have seen at least one ad. . . . More men were also aware of the booklet (48 percent against 26 percent).

The expected differences may be found when we compare exposure for different socio-economic groups, as in Table 1.

Of those who were known to have called or written for the booklet, 84 percent were men, and 30 percent were under the age of 20. They were considerably better educated than the average; at least 34 percent of them (probably more) were students.

Of those who claimed to have seen the ads, 21 percent were unable to recall the main idea, 24 percent described the ads as being about human rights, and 17 percent mentioned freedom of the individual. An almost equally large number of responses were expressed not in terms of human rights in general, but of *children's* rights. One fourth said the ads were about the freedoms and rights of children. An additional five percent said the ads were supposed to teach people to give their children rights and privileges; six percent said that the ads were supposed to teach young children about freedom. Only one percent referred to "The March of Freedom" booklet.

Thus for a good many of those who saw the ads, *attention* was drawn from the *ultimate* point (U.S.—Greek unity in support of universal human rights) to the *immediate* appeal. The ads visualized human rights in terms of the rights of children in order to capture reader interest and to arouse a favorable sentiment for the *underlying* message. Apparently this is what happened, since the ads were (by American standards) extremely successful—not only in reaching an enormous part of their potential audience, but in impressing their central theme upon the memory of the people who saw them. Of all those who saw or heard of the ads, 80 percent commented favorably on them, while only 5 percent had critical reactions. Comments on production and format outnumbered those on the content of the ads, four to three. The ads were liked precisely because their readers accepted them at face value: they were

TABLE 1
*Exposure to the Campaign, by Socio-Economic Status**

	Salonica Booklet Sample	Salonica Cross-Section, Wave II		
	Got Booklet	Saw Booklet	Saw or Read Ads	Not Exposed
Well-to-do	12%	14%	8%	5%
Middle Class	66	68	56	29
Poor	22	18	36	66
Total	100%	100%	100%	100%
N(100%) =	(254)	(62)	(493)	(235)

*Percentages not weighted by sex.

not thought of as propaganda serving a selfish interest. Everyone who had seen or heard of the ads was asked what their purpose was. They answered with references to the ads' literal meaning rather than with any sophisticated inferences about their underlying political objectives; 22 percent said the purpose was to enable people to learn their rights and freedoms. . . .

Another eleven percent said the purpose was to educate and inform people on the subject of freedom . . . , and eight percent said it was to show the life of the free world. . . . Significantly, 22 percent of those answering said the purpose of the ads was to help youth. . . . While this is a favorable judgment, it suggested that the pictures of children, while they attracted interest, distracted some readers from the ads' main message and purpose.

Of those who knew of the ads, 88 percent thought it was a good thing for the U.S. to publish them.

* * * * *

Although, when asked directly, readers did not indicate that the *purpose* of the ads was to gain support for the United States, one in three thought the ads were good because they worked to this end!

* * * * *

The purpose of the ads was, of course, not merely to create a favorable impression, but to influence the thinking of the Greek people. A majority of those who saw the ads had the impression that they were influenced (whether or not they actually were). Fifty-four percent replied affirmatively to the question, "Would you say the ads contributed in any way to your knowledge or attitudes?" Thirty six percent said that they hadn't—a substantial minority which probably includes not only the critical and the apathetic, but a great many people who felt already as much convinced as they could possibly be.

Since attitudes were so predominantly favorable to begin with, the major potential for change was on the part of a small minority of critics. If

all those who said the ads affected their attitudes and knowledge had really been influenced, the campaign might be considered spectacularly successful.

A principal objective of the ads was to stimulate interest in "The March of Freedom" booklet. Of the public as a whole, 28 percent said they had noticed the statement about the booklet in the *ads*, and 9 percent had heard about the booklet in some other way; 63 percent had not heard about it. Eight percent of the public claimed to have read the booklet (21 percent of those who knew of it). Of these, a third had gone to get it at the U.S.I.S. Library, and 37 percent had sent for it. The remainder had read a copy obtained by another family member or by a friend.

Of all those who read the booklet, more than two out of five said it described the *historical* growth of freedom or liberty. Another two out of five said it was about human rights or freedom in general. As in the case of the ads, comments concentrated on production and format rather than on content. Like the ads, the booklet seems to have been accepted at face value, and not thought of as propaganda. Half said its purpose was to teach people about the idea and meaning of freedom. One in every five or six said its aim was to show the development and evolution of freedom in a historical sense. About as many believed it had a general educational mission. Only a small number said its purpose was to win friends for the United States.

Among those who had read the booklet, opinion was virtually unanimous that it was a good thing for the U.S. to publish. This was explained most often by the argument that it informed and educated people about their rights and freedoms. A sizable proportion explained that it was a good thing because it was beneficial to the United States. Thus in the case of the booklet as in the case of the ads, the information campaign won approval for doing the very job of propaganda which its audience did not *think* it was designed to do.

OPINION CHANGES IN THE TEST AND CONTROL CITIES

Thus far we have described the climate of opinion in Salonica and Patras before the U.S. information campaign began, and the audience which the campaign reached in Salonica, the test city. To determine what effect the campaign had on public opinion, we must make a series of comparisons between those who were and were not reached, before and after the campaign took place. The design of the study makes it possible to look for effects in three distinct ways: (1) by comparing results before and after, for the test and control cities; (2) by comparing results, before and after, for exposed and unexposed groups within the test city; and (3) by internal analysis of changes within the test city panel.

Let us first consider whether changes in opinion or knowledge took place in Salonica as a direct result of the campaign, but not in Patras. There was no significant shift of opinion in either city in the proportions who:

1. Felt very favorably toward the U.S.
2. Thought that the U.S. was interested in dominating Greece.¹¹
3. Thought that Russia was the country most guilty of meddling in Greek affairs.
4. Thought the U.S. was doing all it could to help Greece.
5. Though that Communism was mainly caused by economic conditions.

On a number of points, opinions changed between the first and second waves of the study, but they generally changed the same way in *both* Salonica and Patras, apparently as the result of attitude trends throughout Greece.

* * * * *

In a number of respects, however, the campaign appeared to have had an effect in the test city. The number who claimed to have heard of the Declaration of Human Rights was greater on Wave II than on Wave I, in both cities.¹² In Patras, there was a small increase in the percentage who could demonstrate that they knew what the Declaration was. However, in Salonica the proportion familiar with the Declaration jumped from six percent of the public before the campaign to 27 percent afterwards.¹³

* * * * *

Knowledge of the countries that had signed the Declaration and knowledge of the rights and freedoms which citizens enjoy in a democracy increased in Salonica but not in Patras between Wave I and Wave II. There was a major drop in the percentage who could not answer the question, and *more* individual rights and freedoms were named. . . .

* * * * *

There was an increase in Salonica of those who mentioned the right to free choice of employment, the right to own property, and freedom of religion; while fewer persons mentioned these rights on the second wave in Patras. . . . Freedom of opinion and expression was mentioned more often on Wave II in both cities, but the increase was significantly greater in Salonica.

On one other major point there was a clear-cut change of attitude in Salonica only. Although there was no change in the proportion who said the U.S. was sincerely interested in keeping Greece free and independent, the proportion able to support this point of view with *reasons* increased enormously in Salonica. It remained the same in Patras.

* * * * *

EXPOSURE AND ATTITUDES

Thus far we have seen that *opinions* underwent only slight changes in

Salonica, the test city, compared with Patras; while knowledge of the subjects stressed in the ads underwent major increases. Were these changes due to the direct influence of the campaign, or did they occur independently? We can answer this question best by seeing how those who were *most* exposed compare in knowledge and attitudes with those who had *no* contact with either the ads or the booklet.

To do this, a comparison has been made of the special booklet sample (the people who actually *went* or *sent* for the *booklet*) with those members of the Salonica cross-section who *saw* the *booklet*, those who *saw* or *read* at least one *advertisement*, and those who were completely unexposed.¹⁴ The evidence indicates that not only knowledge, but some important attitudes, were different among these different exposure groups.

Those who were least exposed were least able to answer the question as to whether Greece can influence international events. . . . Considering only those who express opinions, it is apparent that, the greater the exposure, the greater the feeling that Greece's opinion matters in world affairs. This is a political sentiment (that is, an expression of patriotism and of conviction that thinking about current events is important). It may also be a reflection of the respondent's personal pride and dignity, of the feeling that his views matter. It is probably a good index of political interest and activity. . . .

* * * * *

While there was no direct indication of anti-American feeling, and very little neutrality, one indication of real opinion about the United States is the distinction between "very favorable" and merely "favorable" views.¹⁵ By this criterion, the people who read the booklet were most strongly pro-American, . . . and those who saw the ads more pro-American, . . . than the non-exposed. . . .

* * * * *

Of those who read the booklet, 87 percent said they were familiar with the Declaration of Human Rights, while 45 percent of those who saw the ads, and only nine percent of the unexposed, made this claim. The greater the exposure, the more familiarity was shown with the rights enjoyed by citizens of a democracy. . . .

* * * * *

Knowledge of democratic rights was greatest among the well-to-do, and least at the bottom of the socio-economic ladder.

* * * * *

Did the campaign tend to select for its audience people who were already predisposed to be favorable toward its objectives? By comparing the responses given before and afterwards by the same individuals in the Salonica panel, we can see to what extent people who started out with a particular opinion (on Wave I) became exposed to the campaign, and compare them with those who initially held other opinions.

There was . . . remarkable similarity in the degree of exposure found among people who were initially very favorable, regardless of their social characteristics. About half the people who were predisposed to be friendly to the U.S. read the ads or the booklet—and this was true regardless of what kind of people they were.

Of those who claimed to have heard of the Declaration of Human Rights on the first wave of interviews, only a minority were actually able to explain what it was. These few became a very highly exposed group. Whatever their personal characteristics, 18 of the 23 cases (79 percent) read the ads or the booklet.

THE EFFECTS OF EXPOSURE ON ATTITUDES IN THE SALONICA PANEL

We have seen (1) that attitudes and knowledge, as well as exposure, differed among different kinds of people, and (2) that though exposure was widespread, it was greatest among those who were the most friendly at the start. With these findings understood we can consider whether exposure *changed* information of attitudes. Table 2 shows the shifts which took place in the percent feeling "very favorable" toward the United States.

There are several points to be noted:

1. The less the exposure, the less favorable was the original attitude on Wave I.
2. Regardless of exposure, between a third and a half of the respondents shifted in their response on this important question. Among those who had read the ads or the booklet a smaller percentage (35 percent) shifted opinion than among those who were less exposed (47 percent).
3. In spite of the fairly large fluctuation of opinion within the panel, shifts in one direction cancelled out shifts in the other direction—

TABLE 2
Per Cent Very Favorable to U.S.
(By Exposure to the Campaign, Salonica Panel)

	Read Booklet	Read Ads	Saw Ads	Unexposed
Very Favorable				
Both waves	46%	50%	32%	24%
Before campaign only	17	17	23	29
After campaign only	17	18	26	13
Neither time	20	15	19	34
Total	100%	100%	100%	100%
N(100%) =	(24)	(116)	(90)	(55)
Net Change	0	+1	+3	-16

except in the case of those who were completely unexposed. This group was less favorable (by 16 percentage points) *after* the campaign, suggesting that exposure to the campaign offset a generally unfavorable trend.

Although this difference is not statistically significant, there appears to have been a very marked pattern in the shift of opinion. Regardless of exposure, the groups which on Wave I were most apt to give no answer to this question (women, older persons, and the low-income group) became more favorable on Wave II, or at least showed no change. Their move from "no answer" to "very favorable" may have been due to the effect of being interviewed twice, rather than to any real modification of attitudes attributable to the campaign.

By contrast with the considerable shift of opinion on this general attitude question, there was relatively little change of judgment as to whether or not the U.S. was helping Greece all it could, with about three-fourths of the respondents holding to the affirmative both times. There was also no real shift of opinion—either among the heavily exposed or the lightly exposed—as to whether Greece influenced international events a great deal.

Although the campaign did not modify opinions significantly, it appears to have been most successful increasing knowledge on the subject with which it dealt: the Declaration of Human Rights. On the first wave, eight percent of the total panel had heard of the Declaration and could describe it. By the second wave this proportion had increased to 32 percent of the total. This increase is entirely attributable to the campaign, as Table 3 demonstrates.

* * * * *

There was also increased familiarity with the individual democratic rights and freedoms. . . .

In the mention of individual rights and freedoms, there was considerable shifting between the two waves. The effect of the campaign was shown most dramatically on the subject of free speech or expression, stressed in the ads. Although in every exposure group there were more mentions on the second wave than on the first, the net increase was greatest among the most heavily exposed (50 percent for those who read the booklet and 33 percent for those who read the ads, compared with 20 percent for the unexposed).

* * * * *

The campaign was extremely successful in conveying information about human rights to the people who were exposed to it, in every sector of the population. At the same time our findings indicate that it did not *directly* affect fundamental attitudes. When we examine the shifts in public opin-

ion which took place between Wave I and Wave II, it is evident that those who read the ads and the booklet did not move in a favorable direction to any greater degree than the less exposed respondents. We found no evidence that this was true within any of the sub-groups of the population, when information was analyzed separately by sex, age and social status.

CONCLUSION

Any campaign which sets out to convey ideas may tend to select in its audience a large concentration of persons who are favorable to its objectives, and who expose themselves in order to reinforce their prior opinions. The Greek ad campaign appears to have gotten its *greatest* exposure among people who were somewhat more friendly to the United States to begin with and more articulate in their views. But these people were an important target, precisely because they were drawn from the more articulate and presumably more politically active sectors of the public.

The ads and the booklet won the approval of their readers; they were considered "a good thing" for the U.S. to publish; their execution and subject matter were liked and even admired. It seems likely that this approval was in part a reflection of the initial attitude of approval for America and things American, as well as an expression of the readers' specific reaction to the ads themselves.

What seems more significant is that readers accepted the ads and the booklet at face value. They were interpreted as a genuine attempt to inform people about rights and freedoms, rather than as an attempt to preach at them or to change their views. The fact that the ads and the booklet were not directly perceived as "propaganda" is as important as the fact that the motives behind them were seen as worthwhile or disinterested. Those who said their thinking had been influenced by the booklet or the ads explained this by references to the subjects on which they had become better informed, rather than by references to changes in conviction or point of view.

TABLE 3

*Per Cent Who Know of Declaration of Human Rights
(By Exposure to the Campaign, -Salonica Panel)*

	Read Booklet	Read Ads	Saw Ads	Unexposed
Both waves	8%	10%	3%	—
Before campaign only	—	4	2	—
After campaign only	79	43	19	5
Neither time	13	43	76	95
Total	100%	100%	100%	100%
N(100%) =	(24)	(116)	(90)	(55)
Net Change	+79	+39	+17	+5

The comparative findings indicate that the campaign increased public knowledge of the subject on which it was focussed, the Declaration of Human Rights, and that it increased familiarity with the individual rights and freedoms enjoyed by citizens in a democracy.

This increase in knowledge took place in Salonica but not in the control city, Patras. The gain was greatest among those who were most highly exposed, and it took place among those exposed within every element of the population.

Increased familiarity with the individual rights and freedoms came about through a large number of small increases in the mentions of individual rights (including a number which were *not* stressed in the ads as well as those which were). Had the ads concentrated on a smaller number of rights, with each one being covered in several different ways and several different times, recollection might have been even higher than it was. However, the purpose of the campaign was not to stimulate recall of the individual rights as such, but to build recognition that they exist as an important bond between Greece and the United States. In this respect the campaign was successful, since it heightened awareness and knowledge of the subject.

Experimental studies have repeatedly shown that it is easier to convey information than to change attitudes, even where there is a large amount of room for improvement in attitude change. In the present case, because opinions were so favorable at the outset, there was slight opportunity for favorable change. Of the minority who, at the outset, were not very favorable in their attitude, a certain proportion were probably "hard-core" Communists, and an additional number were politically apathetic and largely beyond reach of the mass media. This left a comparatively small residue of individuals with a neutral, suspicious or critical view of the United States who might be considered primary targets for a campaign to change attitudes, but who tended to be people who were harder than average to reach through conventional channels.

Careful exploration has yielded no evidence to prove that any change due to the campaign took place in fundamental attitudes. It is important to note that a *simpler* study design might have suggested that major changes took place on a number of points. We have seen that in some cases opinions became more favorable in Salonica (but they also became more favorable in Patras). On the second wave in Salonica, the exposed were more favorable than the non-exposed (but the same individuals were also more favorable to begin with). The use of several methods of control in the design of the study made it possible to rule out such spurious indications of effect.

Only one facet of opinion appears to have been influenced as the direct result of the campaign: it seems to have made people better able to give

reasons in support of their existing conviction that the United States wants Greece to remain free and independent. Most particularly it seems to have made more people believe that America's general attitude (and not any selfish interest) favored such a desire—that America was in effect a country devoted to human rights and freedoms, including the rights of small nations. This interesting development demonstrates how the campaign's effects in conveying information may begin to be translated into attitudes. What happened was not so much an attitude change (attitude was favorable from the beginning on this point). Rather the campaign seems to have confirmed already favorable opinion by giving it a supporting argument.

Changes in public opinion come about slowly, and international propaganda always functions within the context of world events. This survey adds to the already considerable weight of evidence which shows that (apart from political acts) attempt to influence opinion must be carried on consistently and over a period of time before any major shifts are detectable. If, in the long run, what the Greek people *think* of the United States, or of democracy, is a product of what they *know*, then the Salonica test campaign contributed toward the larger purpose of the U.S. information program.

⁴ The writer assumed responsibility for this project after the completion of the field work. The original research design was prepared by Herta Herzog and Donald B. Armstrong, Jr. The field work was under the direction of William Reynolds. Ben Gedalecia headed the Office of Research and Evaluation of the U.S. Information Agency at the time the study was made. The interpretations and statements made in this article are solely those of the writer and in no way reflect either the official position of the Information Agency or that of the writer's own organization.

⁵ *Macedonia, Fos, Ellinikos Vorras, Nea Alithia*.

⁶ During this period, elections were held both in Greece and in the United States, truce negotiations were bogged down in the Korean War, and the Soviet bloc continued to spar with the West in the U.N. General Assembly.

⁷ Both cities surveyed are major ports—though Salonica is a larger and more prosperous one than Patras. In Macedonia, only 50 or 60 miles from the Bulgarian and Yugoslav borders, Salonica became a part of modern Greece only in 1913. It is the country's second largest city, with 300,000 inhabitants (and another 150,000 in the surrounding area). More cosmopolitan, and because of its size, position and history, more internationally minded than Patras, Salonica was closer to the centers of Communist rebellion during the Greek civil war. Patras, with a population of 67,000, is a provincial city in the Northwestern Peloponnese.

⁸. More complete answers were received for this part of the question on the second wave of interviews, so that they could be coded in more detail. On this second wave, 47 percent (P) and 45 percent (S) specifically mentioned Greece's importance as a military base.

⁹. While responses on this point may have been affected by the prevailing political atmosphere, the pro-Communists would be more apt to give *no* answer than to give a false one. Even if the percentage not answering these questions is considered to be (in part, at least) hostile to the United States, the over-all picture is still extremely favorable.

¹⁰. To simplify the presentation, the statistics for the panel are not reported here. On some points the percentages are somewhat different for the two samples. In part this is due to sampling variations. In part it stems from a "panel effect" often noted in studies of this kind, which comes about because respondents have been asked the same or similar questions previously and are sensitized to the subject matter and the interview situation. The data for the panel group are examined in detail later.

¹¹. As opposed to those who said that the U.S wants Greece to remain free and independent.

¹². The rise in Patras may be due to independent mentions of the Declaration in the Athens and Patras papers, or simply to a difference in interviewing technique between the two waves of the study. Knowledge of the Declaration, rather than the claim to knowledge, is the major consideration here.

¹³. Although the jump from two percent to ten percent in Patras is also statistically significant, it simply reflects the increase in the number who claim to have heard of the Declaration, whereas in Salonica there was a great rise in the proportion as well as the number who knew what it was.

¹⁴. The actual, rather than the sex-weighted totals are used here, since the booklet sample is so predominantly male.

¹⁵. Anti-American respondents who feared to express their views openly might be expected to give the weaker of the two responses.

RADIO LIBERTY'S AUDIENCE IMPACT AND EFFECTIVENESS*

BY JOSEPH G. WHELAN

This discussion of Radio Liberty's attempts to obtain some feedback from its audience indicates the political and societal limitations on audience analysis in closed societies.

* * * * *

I. POSITIVE MEANS FOR EVALUATING RADIO LIBERTY'S EFFECTIVENESS

A. Interviews with Soviet Citizens

1. Some Sources for Judging Audience Response

Despite known disadvantages, which by the nature of things cannot be easily corrected, Radio Liberty (RL) attempts, nonetheless, to establish some positive basis for judging audience impact, however imprecise it may seem compared with the reasonably accurate techniques in American public opinion research. It does this by collecting evidence on audience reaction, (1) in interviews with Soviet visitors to the West, legal Soviet expatriates, Soviet defectors, and with some Soviet listeners actually living in the Soviet Union itself; and (2) from letters received from Soviet listeners through the indirect method of a mail drop in the

*Excerpts from Chapter VI, "Radio Liberty—A Study of Its Origins, Structure, Policy, Programming and Effectiveness," The Library of Congress, Congressional Research Service, Washington, D.C., February 29, 1972.

West. The substitute audience panel and the special program auditions panel provide another input, though limited, into assessing possible audience response.

Through these efforts [the Audience Research Division of Radio Liberty] (ARD) attempts to fill the gap between the speaker and the audience, to determine an accurate image of the listener and the listener's image of RL (both essentials for success in communications), and to build the foundations for a continuing dialogue with the audience. The Director of ARD files a quarterly report containing an analysis of and references to listener mail, reactions to RL emanating from the media of the Soviet Union and other Communist countries, conversations with Soviet listeners at home and abroad, and related background material on attitudes and conditions in the Soviet Union.

2. Difficulties in Interviewing

Interviews, or "conversations" as RL prefers to term them, presumably since they lack the formal structure and statistically-workable ingredients of professional poll-taking known in the United States, are regarded as a prime indicator of audience response. During FY 1971 interviews were conducted with hundreds of Soviet citizens, of whom well over one-half were foreign radio listeners. But, interviews are very difficult to conduct. Polling by Soviet Government agencies has only begun in recent years in the Soviet Union, and the people do not regard them as scholarly efforts but rather as instruments of the KGB. The problem is especially acute in the Soviet Union where the climate of suspicion impedes a genuine exchange of views, especially with a foreigner. Even interviews conducted with Soviet visitors in the West are carried out with difficulty. It is estimated that only one out of eight contacts will yield a fruitful interview.²

The results of interviews are sent to RL headquarters in Munich by field correspondents where they are compiled in a final Target Area Listeners Report that is prepared by ARD and distributed throughout the organization. These reports describe the interviewee, his occupation, nationality, age, and language facility. They include such details as place, listening times, language of broadcast, audibility, jamming effectiveness, and specific programs of interest. In addition, the conversation is summarized, and this may include statements about public reactions, comments on recent events and expectations about future developments.

3. Analysis and Use of Interview Data

RL approaches analysis of audience research data conservatively. ARD does not claim to have enough data at its disposal from interviews to speak about a "sample"—that is, as interpreted in a statistical sense.³ It does not go beyond the claim of having only "bits and pieces of samples that could be indicative of some certain groups." Yet, Mr. [Howland] Sargeant [President of the RL Committee] has written that such interviews have been collected and properly coded, transferred to cards and

can be processed by machines to show "an increasingly accurate picture of the listeners, and of potential listeners." ⁴

Accordingly, ARD is able to give RL programmers some perception of their audience's image and scattered evidence of impact and effectiveness. In recent years this perception and measure of effectiveness have no doubt become more reliable because the percentage of ARD interviews has been progressively increasing from 17 percent in 1969, to 23 percent in 1970 and up to 41 percent during the first quarter of 1971.⁵ The ages of RL's listeners were estimated in mid-1971 to be 35 percent in their 20s; 31 percent in their 30s; and 16 percent in their 40s.⁶ The preferred listening time was cited at 2001-2400 for 57 percent of listeners, with the next highest percentage preference at 16 percent from midnight to 0400.⁷ The distribution of audience occupation in 1970 was concentrated heavily among the intellectuals, including university students: 72 percent of the listeners were said to be from the intellectual professions.⁸

Clearly, audience research data of this nature confirms RL's judgment on audience structure, policy content, and program design. This is especially true of ARD studies on audience reaction to samizdat [the private publication and circulation of one's own works in the Soviet Union], presently the main staple of RL's programming. Again, RL's judgment was reaffirmed. During the first quarter of 1971, 87 percent of the interviewees mentioned samizdat favorably, 3 percent with mixed or neutral reaction, 10 percent hostile reaction. During the fourth quarter of 1970, 100 percent of the interviewees mentioned samizdat in a friendly manner; for the third quarter of 1970, there was 90 percent with 10 percent mixed or neutral. The total overall percentage for this mini-month time-frame from July 1, 1970 to March 31, 1971 was 85 percent friendly, 4 percent mixed or neutral, and 11 percent hostile. Moreover, RL's focus on the intelligentsia was reaffirmed. The majority of listeners mentioning samizdat (70 percent) belonged to various segments of the intelligentsia.⁹

Undoubtedly the most comprehensive assessment of empirical evidence of RL's effectiveness drawn from interviews is contained in ARD's quarterly reports. The report for the second quarter of 1971 generalized on the data collected in an effort to determine listener profile, effects of jamming, specific program interests, programming suggestions, RL's impact and image in the eyes of its listeners, attitudes on specific problems such as samizdat and Jewish emigration, criticism of RL, and responses from the nationality areas.

On the basis of empirical evidence the listener profile for the second quarter of 1971 looks like this: RL respondents came from all walks of life, although the number of those holding positions in the technological, scientific, and cultural fields outweighed those in other professions. Many listeners were under 40 and an "overwhelming majority" supported RL and its aims. Listening took place mainly in large industrial cities such as Moscow, Leningrad, and Kiev and their surroundings, though a sizeable number in Siberia, Uzbekistan and Kazakhstan in Central Asia, to

Georgia and Armenia in the South. [sic] Most listeners whose nationality was ascertainable were Russians, followed by Ukrainians, Belorussians, Karelians, Georgians, Kazakhs, Latvians, Estonians, Lithuanians, Tatars, Bashkirs, and others from Eastern Europe.¹⁰

Other categories within the report either directly or indirectly provide some indication of RL's effectiveness, but perhaps none so much as "Radio Liberty's Impact and Image in the Eyes of Its Listeners." Under this category numerous comments were made about reasons for listening to RL and what its impact was judged to be.

For a scientist, RL had become a "most important source of information and a link between our more free-thinking intelligentsia and the Soviet working people." A musician considered that "normalization" of Soviet life could only come through the creation of a public opinion which would exert pressures for change. Since there was no freedom of information at home, the initiative had to come from abroad—and RL, he said, was the only possible source. "Thanks to Radio Liberty's broadcasts," said a Moscow engineer, "I have learned to think and develop a 'free relationship' with the outside world." This theme was reiterated by a Soviet musician who said that "free voices from abroad, especially the voice of Radio Liberty, are the only forces which can wake people up and open their eyes."

Listeners were aware of regime attacks on RL and expressed concern for the radio's future. According to a Moscow engineer, rumors were being circulated to the effect that the station would soon cease broadcasting.

RL was of special interest to a Leningrad scientist since, in his words, "It is what a Russian radio station would have been like if we had had freedom of speech in our country." A traveler from Sverdlovsk considered RL to be "a free and international" station, not government operated like the BBC or VOA, and this enabled it to devote so much time to Soviet problems. He appreciated this. A Kiev intellectual who previously thought RL was an "American propaganda station" had changed his opinion when he became more familiar with its broadcasts. He now felt that, although financially supported by the United States, it was working for the good of Russia. Whenever an official announcement was made in Soviet media, said one engineer, it was very common to hear people remark: "That's what 'ours' said. But we still have to know what 'they' will say." "They" was RL.¹¹

Scattered evidence of impact and effectiveness like this and other evidence included in the quarterly report cannot constitute a "sample" according to the statistical requirements of public opinion research. RL is the first to acknowledge this limitation. Yet, it would seem to be a commonsense judgment that comments by opinion leaders such as scientists, engineers and others within the intelligentsia could be reflective of important preferences and predilections of others within the Soviet intelligentsia and perhaps even in broader segments of Soviet society.

B. Letters from Soviet Listeners

1. *Techniques for Eliciting Listener Response*

Interviews as a means of evaluating audience response are supplemented by letters from Soviet listeners. Such letters are regarded as documentary evidence upon which judgements can be made on Soviet listening behavior and on Soviet attitudes toward RL programming.

There are two ways in which letters are received from the Soviet Union. One is by establishing give-away accommodation addresses in the West. Under this system the listener is asked to write a particular box number in a designated West European city, and he will receive in return certain give-away material, such as books and records. A popular give-away book of particular interest to radio enthusiasts is the *World Radio TV Handbook*. This is merely a standard radio handbook available in any major reference library in the West.

The other system of eliciting listener correspondence is to urge the listener to communicate with the RL speaker at an address given in the West. In both cases, the mail is forwarded to RL where it is categorized according to favorable and unfavorable letters, location of sender, etc. Such letters-to-the-editor type of correspondence and give-away offers to listeners are common practice in a free society such as that in the United States.

2. *Statistics on Listener Mail*

According to RL, audience feedback through mail has increased considerably in the past decade.¹² Except for a momentary decline in early 1971, apparently, the general trend continues upward. Actual numbers of letters received are not available for publication; percentages are. This may not be entirely satisfactory, but it does serve the purpose of giving some indication of listener response through mail, and at the same time denying important information to the Soviet censor.

Increasingly, more listener mail has originated from the Soviet Union than from the countries of the Soviet bloc. In 1968, 31 percent came from the USSR; 69 percent from the bloc. In 1969, 56 percent from the Soviet Union; 44 percent from the bloc. In 1970, 62 percent from the Soviet Union; 38 percent from the bloc. And for the first three months of 1971, 87 percent from the Soviet Union; 13 percent from the bloc.¹³

In the second quarter of 1971, listener mail decreased in number. Aside from the seasonal factor (the second and third quarters of the year usually have less mail than the fall and winter quarters), the decrease in listener mail in the second quarter was ascribed to RL's discontinuance of give-away offers and to the hostile and systematic campaign which Soviet media have been waging against RL during the past three quarters. In fact, only one letter was a response to a former give-away offer, while most of the other mail items contained comments, both friendly and critical, to problems and questions raised in RL's programming. It was

during the first quarter of 1971 that 105 attacks against RL in Soviet and orbit media were recorded, a figure surpassed only during the previous quarter when 156 attacks were recorded.¹⁴

Audience mail does serve the useful purpose of giving RL some perception of its listenership. In the first quarter of 1971, 96 percent of the mail was regarded as substantive in content; 4 percent without substantive content. In the second quarter, the percentages were 95 and 5 percent respectively.¹⁵

Russian is the language in which most of the broadcasts were heard. In the first quarter of 1971, the percentages were 85 percent Russian, 13 percent Ukrainian, and 2 percent Georgian. In the second quarter, the percentages were 74 percent Russian, 16 percent Ukrainian, 5 percent each for Belorussian and Bashkir.¹⁶

As for geographical distribution of audience mail, in the first quarter of 1971, 56 percent came from the RSFSR, 30 percent from the Ukrainian SSR, 4 percent from the Georgian SSR, and 2 percent each from the Latvian, Estonian, and Moldavian SSRs. Those addresses that could not be ascertained were placed at 4 percent for the entire USSR. For the second quarter the percentages were 50 percent, RSFSR, 31 percent Ukrainian, 6 percent Belorussian, 6 percent each for the Latvian and Lithuanian SSRs. From the other Communist countries in Eastern Europe the percentages were as follows: 30 percent Rumania, 30 percent Poland, 20 percent Czechoslovakia, and 10 percent each from East Germany and Bulgaria.¹⁷ In 1967, RL reported that "an extremely high proportion" of its mail comes from Moscow.¹⁸

RL also categorizes its mail according to "repeat writers" and "first-time writers." In the first quarter of 1971, the letters from repeat writers were 6 percent from the Soviet Union and 71 percent from the bloc countries. Letters from first-time writers were 94 percent from the USSR and 29 percent from the bloc countries. In the second quarter of 1971, the percentages were 6 percent repeat writers from the USSR, 67 percent from bloc countries; and 94 percent first-time letters from the USSR, and 33 percent from the bloc countries.¹⁹

Moreover, RL records the sex of its correspondents. In the first quarter of 1971, 81 percent of the correspondence was from males, 19 percent from females. In the second quarter, 68 percent was from males, and 16 percent from females, with 15 percent unascertainable.²⁰

3. Content of Letters

RL also categorizes the content of its mail according to "friendly" letters and "hostile/critical" letters. The report for the second quarter of 1971 stated that the proportion of hostile to friendly letters was not as high as in the previous quarter, but was "still substantial." "Some of the hostile letters," the report said, "indicated that their authors were acquainted with the official reactions to Radio Liberty's activities."²¹

In general, friendly listeners praise RL's operations and criticize their own Soviet media. Judgments are made within the context of compari-

sons between Soviet "democracy" and genuine democracy in the West. RL is also praised for providing information to the Soviet listener in the tradition of a free press. One listener from the Ukraine commented favorably on RL for its "regular and accurate information." In turn, he criticized the Soviet leaders who "maintain a cowardly silence and wish to hide a pig in a poke from their very own people. . ." The writer continued:

In so doing, of course, to our shame and regret we have to learn the truth not from the voice of the public, but from abroad. And all this only serves to undermine more and more their authority in the eyes of their own people . . . Let me express over and over to you my acknowledgment that you have been able to open my eyes and broaden my horizon.

Taking issue with RL's question on the 24th Congress of the CPSU, the writer continues:

I only regret that I am a Russian and still live in this wretched Russia and have to write in shameful block letters like an illiterate at a time of freedom of the press and speech. And I am not sure whether my letter will reach you and whether I will find out about it in your broadcasts. If you receive it, may I ask you strongly to put over its message in several programs; for, because of the strong jamming, I may not hear my own voice. . . .²²

Another writer from Stravropol Kray, The Russian Soviet Federated Socialist Republic (RSFSR), a woman listener, made the sweeping judgment that "everybody [in the USSR] listens to Radio Liberty." In the buses, she said, people exchange comments about its broadcasts. She praised RL's *Women's Show* series devoted to the Soviet working woman but added this critical comment: "Your in the West have no idea what . . . [the life of a Soviet Woman is like], but you are not to blame for that."²³

RL also receives and records in its files letters that are hostile and critical. A worker at the Zaporozhstal factory, claiming to speak for his comrades, denied both the persecution of Jews and the restrictions on freedom for Soviet writers. Seemingly well informed about the activities and works of a number of Soviet dissidents, he compared the virtues and achievements of the Soviet constitution with the "freedom" in America where "in broad daylight" a President is murdered.²⁴

A letter in a similar vein from a listener in Moscow Oblast dismissed the "slanders" whose "cast-iron throats will be silenced," and concluded: "The day will come when there will be no more West Germany, U.S. or any other capitalist country."²⁵

Another letter from a group of Tatars and Bashkirs charged that RL presented their life "in a distorted way;" that they "have got enough of everything;" and expressed compassion for the lot of former Soviet citizens living in the West in these words: "We are sorry for you, brothers."²⁶

RL categorizes responses from listeners according to "friendly" and "hostile/critical" reactions and attempts to measure the response in percentages. During the first quarter of 1971, the category "friendly" response recorded 43% for letters and 85% for interviews; the category "hostile/critical" recorded 57% for letters and 15% for interviews. For the second quarter, the percentages for the "friendly" category were 74% for letters, and 88% for interviews; and for the "hostile/critical" category, 26% for letters and 12% for interviews. The total percentages for both

quarters and for both letters and interviews were 81% for "friendly" and 19% for "hostile/critical."²⁷

4. Significance of Listener Mail

Listener mail provides RL with another important input of data, despite acknowledged imperfections, to flesh out its perception of the Soviet audience and to measure its effectiveness in broadcasting. It provides further documentary evidence, though minimal, of audience reaction. What is important to bear in mind in measuring the value of listener mail was pointed out by George Perry, namely, that "people write when they are really motivated, either pro or con"—meaning that listener mail reflects a significant reaction to programming and thus takes on a special value of its own in determining audience reaction.

On the other hand, the value of this reaction may be somewhat diminished by the fact that, apparently, RL strongly encourages listener response by mail; in fact, the practice may be overdone. As one senior RL staffer said in a post-broadcast audition on the matter of soliciting listener mail: "Perhaps we are unwittingly giving it more emphasis than is advisable."²⁸

Nevertheless, this does not devalue listener mail per se as an important input factor in measuring audience impact; for, listener mail, whether pro or con, is an affirmation of RL's purposes, namely to provoke the Soviet people to think critically and independently and to contemplate alternative solutions to problems on the basis of more complete information. Dr. Sosin inferred as much in a statement evaluating the evidence on RL's listenership. The evidence that RL is heard in the Soviet Union, he said, comes from hundreds of interviews with Soviet tourists, members of delegations in the West, conversations with Soviet citizens held by Western tourists, guides and students, and "perhaps most important," he said, "from letters which slip through the net of Soviet censorship and reach Radio Liberty's mail drops in the free world." "The great majority of this audience mail is favorable," he continued, "and encourages Radio Liberty in the conviction that its basic premise is sound, namely, that in all walks of Soviet life people are thirsty for information and ideas denied them by the official media; that in the current era of ferment after de-Stalinization they seek a deeper understanding of their own society."²⁹

C. Other Bases for Evaluating Effectiveness

1. References to RL in Soviet Literature

For internal organizational purposes RL relies wholly on interviews and listener mail as positive means for evaluating its effectiveness. Still, the frame of reference for audience reaction could be broadened to include comments in Soviet literature (not regime attacks) on RL and other foreign broadcasters, and also to include general evaluations on RL's activities made by Western authorities, private scholars or officials in government.

With regard to the first point, that is, references in Soviet literature, there has been a steady growth of evidence to demonstrate the value of

RL in the eyes of many Soviet listeners. Frequent references have been made to Western broadcasts in Soviet literature, particularly in samizdat, and appeals have been voiced urging that such broadcasts be continued.³⁰ Yuri Galanskov, author of the samizdat, "Organizational Problems of the Movement for Full and Universal Disarmament," made this reference in an appeal on behalf of imprisoned dissenters:

The Western press, and especially Western radios in the Russian language, give wide currency to facts of arbitrary judicial actions and administrative perversion, pinpoint their social nature, and force the state organs and officialdom to take urgent measures. This overcomes the natural inertia and conservatism of the bureaucracy . . . In functioning like this, Western press and radio perform the task of an organized opposition which is presently lacking in Russia, and thus stimulate our national development . . .³¹

A recent example of this sort of evaluation by indirection was the revelation in *The New York Times* in August 1971 of the existence of a publication in the Soviet Union called, "Political Diary." It was described as an exceptional example of political samizdat. Typical of the disquiet evident in this publication was a letter dated February 1966 and sent by an educator to Premier Kosygin. Of particular importance for this study is the writer's reference to Western radio broadcasts. The letter, printed in the Diary, said that people had "a great many questions to which they are not getting direct answers, either in the press or on the radio, or in the speeches of our party and Government leaders. It is not surprising that many of our people are beginning to find their answers in foreign radio broadcasts."³²

Another form of evaluation by indirection is the frequency with which the upper echelons of the Soviet ruling elite draw upon foreign broadcasters like RL as sources of information. This statement cannot be documented with the precision of the above reference to the "Political Diary;" but it is known that the Soviet leadership draws heavily upon daily monitored news from abroad. As Dr. Pool observed: "For the Soviet elite there is, of course, as there always has been, substantial coverage of foreign news sources in the classified monitoring reports."³³ Even middle and upper class Russians have shortwave radios available, and, accordingly, as Dr. Pool noted, "BBC, Voice of America, and Radio Liberty broadcasts are normal information sources for high status Soviet professionals or bureaucrats."³⁴ By implication, therefore, the Soviet leadership itself places a high positive value on foreign broadcasters such as RL.

What effect such access to outside information sources has on the ruling elite cannot be determined. In a comment on the immediate prospects of samizdat developing into "any sort of important political force," Peter Reddaway made an observation that has relevance to this larger question. "I happen to think," he said, "that samizdat at its present stage and in the present state of the Soviet society has little or no direct impact on policy-making by the leader. I do not see it as part of a political struggle. On the other hand, I see it as potentially of the greatest significance . . ."³⁵

2. Views of Former Soviet Citizens and Western Authorities

Other sources of evidence upon which to judge RL's general audience impact are the assessments of former Soviet citizens now living in Israel and the West who had been listeners while in the USSR, and also assessments by Western authorities who through their various academic and official connections have established credentials for passing judgment. All comments found tended to support the radio. This does not necessarily mean, however, that there has been no adverse criticism. The following are examples of favorable commentary.

Dr. Boris Tsukerman, Soviet physicist and human rights activist who left the Soviet Union in January 1971 and is now a citizen of Israel, declared that "Radio Liberty has its own audience in the USSR. This conclusion is the result of my conversations with many people."³⁶

Mrs. Natalia Belnikov, wife of the deceased Soviet writer Arkady Belnikov, lecturer at Yale University, and former staff member of the Sociological Department of the Moscow Radio and Television Committee, described their listening habits and those of their friends while in the Soviet Union. What seems most significant about her comments is the high value that is placed on the work of foreign radio broadcasters and also the widespread influence these broadcasts have within the Soviet intelligentsia. Mrs Belniko said:

I well remember the efforts made by my friends to hear, despite difficulty, the unfettered word filtering through jamming. My invalid husband would spend hours sitting tensely before the radio, operating the volume and tuning controls with both hands. We saved our money, and even went without necessities, in order to buy the most sensitive receiver; all of us had homemade schedules of broadcasts by the BBC, VOA, and Liberty. People brought (illegally, of course) special adapters for Soviet-made receivers in order to increase the range of frequencies. We would report to each other immediately on what we had heard, and set up a timetable to take turns listening. I happen to know that recently this timetable has been operating throughout the night time when the jammers are ineffective. The technique of listening has been perfected. Broadcasts are being recorded on tape recorders. The broadcasts that are most prized by listeners get transcribed on the typewriter and become part of *samizdat* . . . ³⁷

Western specialists on Soviet affairs have also made assessments on the effectiveness of RL as a broadcaster. Peter Reddaway, Soviet specialist at the London School of Economics, stated that from his "intensive study in recent years" on the democratic tendencies and movements in the Soviet Union he has accumulated "massive evidence of the importance which these tendencies and movements attach to Radio Liberty."³⁸ Another scholar, Jean Train, Professor of Russian at the Ecole Polytechnique, declared that according to many of his informants, RL "is listened to avidly by most of the intellectuals and leaders in the Soviet Union" with whom he has been in contact for many years. So important are RL's programs to these intellectuals that a number of groups have been formed, he said, "for the express purpose of listening to them and discussing them afterwards."³⁹

Governmental authorities on both sides of the Atlantic have commented favorably on RL's effectiveness. Before the Senate Foreign Relations Committee, Mr. Martin J. Hillenbrand, Assistant Secretary of

State for European Affairs, acknowledged that estimates of the number of RL's listeners are "of necessity less precise" than those of RFE, still, "there is extensive corroborative evidence which shows that . . . it has a large and tenacious audience." Mr. Hillenbrand went on to say that further evidence of audience impact comes from foreigners living and working in the area "who confirm that these peoples depend on the radios and that a significant proportion of the broadcasts penetrate the jamming." "One of my colleagues, fluent in Russian, who recently spent a two-year tour in the Soviet Union," Mr. Hillenbrand continued, "has said that in all his wide travels in that country he seldom met an individual who did not admit to listening to Radio Liberty." ⁴⁰

A similarly favorable appraisal came from Asher Lee, a British specialist on Soviet affairs and BBC Director of External Audience Research from 1948 to 1970. "In their research work conducted by us at BBC," Mr. Lee said, "we received many indications that this unique service provided by Radio Liberty was widely heard and appreciated by a significant audience in the USSR who, to a great extent, rely on Radio Liberty for information and an analysis of events in their land and abroad." Many Soviet listeners regard RL as their own station, he said, adding that RL broadcasters are regarded by Soviet listeners not "as foreigners transmitting from abroad, but as friends who enlighten." ⁴¹

Taken together, many of these statements, and others that are included in RL's formal presentation to Congress and appended to the Senate Foreign Relations Committee hearings, have the ring of a self-serving commercial so frequently seen on American television; but this is a matter of tone and style, and does not devalue the substance, for many of the scholars making these assessments are leading and respected specialists in Soviet affairs in the Western world; thus their judgments have validity; they carry the weight of authority. Negative appraisals by scholars could not be found in published literature.

II. REGIME ATTACKS AND JAMMING AS MEANS OF EVALUATION

A. Regime Attacks on RL

1. *Soviet Tradition of Attacking RL*

Documentary and empirical evidence are positive means which RL uses to determine impact and effectiveness. RL uses other means, essentially negative, that provide another measurement, however imprecise, namely, the number of regime attacks and the persistency of Soviet jamming.

Soviet attacks on RL are nothing new. What is new is the intensity and frequency of these attacks. The Soviet book, "U.S. Radio in Psychological Warfare," published a few years ago summarized the regime's inveterate opposition to RL in these words:

It is well known that of all types of Western "freedoms" "Radio Liberty" makes intensive use of one—freedom of slander, or falsifying facts and of fabricating provocative rumors. Up to the present day, "Radio Liberty's" broadcasts [transmitted] in the languages of the peoples of the USSR consist of overt and malicious

subversive propaganda. All of this has been mentioned more than once in the Soviet press.⁴²

* * * * *

B. Soviet Jamming of RL

1. *Extent of Soviet Jamming*

An equally important measurement of RL's impact and effectiveness, even though negative in character, is the persistency of Soviet efforts to jam its signal. Within 10 minutes after RL went on the air in March 1953, the Soviet Government began jamming operations; it has continued ever since, jamming RL around-the-clock 24 hours a day.

This has not been the case with other foreign broadcasters. As early as 1956, jamming operations ceased against the BBC on the occasion of Khrushchev's visit to Britain. VOA experienced a similar respite in 1959 when Khrushchev visited the United States. Between these years and 1963 both stations experienced periods of selective jamming during which many of their broadcasts got through without interference. In June 1963, the Soviet Government suspended its jamming of all major non-Communist world broadcasters, except RL.⁴³

III. RL'S AUDIENCE IMPACT AND EFFECTIVENESS

A. What Does It All Add Up To?

How is it possible to make any valid judgments on the extent of RL's impact and effectiveness? Hundreds of interviews a year from a narrowly selected audience provide one input for measurement. Listener mail, some 6,000 letters since 1956 (an average of some 33 letters a month), provide another.⁴⁴ Both represent positive means for judgment.

Assessment of regime media attacks and calculations of Soviet investment in time, resources and energy into jamming provide essentially negative inputs. Yet, they, at least, have the virtue of creating greater certainty in a very uncertain area of human judgment.

But, what does it all add up to?

* * * * *

B. Possible Modifying Factors

Commonsense seems to dictate that the positive inputs of interviews and listener mail can at best give RL only a hazy image of its audience and an uncertain estimate of its effectiveness. Still, this judgment might be modified somewhat by the knowledge that interviews, particularly those among the scientific intelligentsia, have an especially high value in weighing impact since they represent opinion leaders within Soviet society. Moreover, the number of interviews are, apparently, on the increase, especially with the expansion in the last few years of the Soviet Union's scientific and cultural exchange programs in the West.

This judgment might be modified still further by an awareness that while RL may have an opaque view of its audience, nevertheless, by the expertise of its staff, the quality of research, and particularly the emergence of the samizdat phenomenon, an unknown quantity in the early to mid-1960's which provides rich new insights into the workings of

Soviet society, RL itself can make assessments of its audience, programming needs, and probable effectiveness that may make this ordinarily opaque image appear somewhat clearer. Thus, it is possible, though not provable that RL may not be "flying blind" entirely, to use Mr. Sargeant's metaphor, and perhaps may even be in atmospheric conditions that are somewhat clearer than "a pea-soup fog."

NOTES

SOME EFFECTS OF RADIO MOSCOW'S NORTH AMERICAN BROADCASTS*

BY DON D. SMITH

Opinion change may result from an "unexpectedly better" audience impression of communications.

* * * * *

Although international political communication is now a very prominent part of international political activity, actual empirical research in this field is quite scanty.¹ This study continues to report some research in one area of international political communication—short-wave radio broadcasts from an official source in one nation to an audience in some other nation.

Some research reported recently in *Public Opinion Quarterly* found that there is a sizable audience in the United States to political programs broadcast directly to this country from other nations by short-wave radio.² What effect do such broadcasts have? The last controlled research on the effects of short-wave radio broadcasts to American audiences was conducted in 1942. In that study of German and Italian broadcasts, Allport and Simpson found that the broadcasts were generally ineffective, although some positive effect was noted on a few issues under certain conditions.³ In the 27 years since that research was conducted, international political broadcasting has intensified to the point where it now represents a major part of the international political communication

*Excerpts from "Some Effects of Radio Moscow's North American Broadcasts," *Public Opinion Quarterly*, XXXIV (Winter 1970-1971), pp. 539-551. Reprinted with the permission of *The Public Opinion Quarterly*, copyright holder, and the courtesy of the author.

expenditure of many nations.⁴ Moreover, when compared to the efforts of a generation ago, considerable skill has been developed in communications designed to persuade. What are the effects, then, if any, of short-wave radio broadcasts on the current audiences?

Replies from the current American audience certainly suggest that such broadcasts do affect their political opinions and beliefs. These "real-life" listeners say that the broadcasts "help them see the other side of the story," and "provide a broader perspective of international events."⁵ Another response from this actual audience which is of particular relevance for the study reported here is that one of the stations to which they listen most frequently is Radio Moscow.⁶ This paper reports the results of an experimental study which examines some effects of Radio Moscow's English language North American broadcasts. To gain experimental control, the subjects are not a "real-life" audience, but the results will be compared to those reported by actual listeners.

THEORY

A very small but intensive pilot study provided the theoretical leads utilized in this research.⁷ In that early research it was found that (1) by our standards of effective communication, the content (and the manner in which that content was presented) of Radio Moscow's North American programing was very poor, and would probably not be considered effective no matter what the goals of the communicator might be;⁸ (2) the program content was biased and anti-United States, and the listeners perceived it to be such; (3) but the listeners were quite surprised that the content was not even more biased and more anti-United States. (4) Despite these negative characteristics, the respondents felt themselves to be influenced by what they had heard. The study reported here began with a search for a theoretical orientation which would provide a meaningful frame-work for the interpretation of these preliminary observations.

Social psychological research has noted that the response of an individual to a message is a function of the perceived relationship of that message to some internalized standard. Individuals evaluate incoming stimuli against some standard which they bring to the situation, and the direction and extent of their response is a consequence of that comparison. Within this framework, cognitive congruity or consistency formulations have emphasized the logical "fit" of the stimulus with some pre-existing cognitive structure, that structure usually being viewed as consisting of those attitudes and beliefs held by the individual which he relates to the incoming stimuli.⁹ More recent assimilation-contrast and social judgment formulations have emphasized the evaluation of a stimulus against a range of internal reference points.¹⁰ In both approaches, there has been increasing recognition that an individual's *expectations* about the stimulus are a prominent part of the baseline or standard against which he compares incoming stimuli.

The conclusions of such research have been that small deviations from

what is expected produce positive affect and positive construal of the stimulus, while gross deviations from what is expected produce negative affect and negative construal of the stimulus (with confirmation of expectancies resulting in some negative affect also). These results have been obtained regardless of the direction of the deviation from expectancy. In this view, gross disconfirmation of expectancy, no matter whether the stimulus is perceived as better or worse than expected, should result in negative response to that stimulus.¹¹

In real-life contexts, such experimental results have rather startling implications. According to this thinking, we should respond negatively if something turned out to be much better than we expected it would, or respond positively if something turned out a little worse than we expected it would; a student would respond negatively on learning he had passed a test he expected to fail, and respond positively on learning he had barely flunked a test on which he expected to get by; or a traveler in a foreign land would respond even more negatively on finding his original negative stereotype about the host country clearly disconfirmed. There are enough readily observable everyday situations which do not fit such a pattern to indicate that something is missing from these theoretical formulations.

Harvey and Clapp have added an important point by recognizing that the baseline or standard with which a stimulus is compared has evaluative dimension.¹² They note that human beings have hopes and desired goals as well as expectancies, and evaluate stimuli against these hopes as well as comparing them with their expectations. Harvey and Clapp found support for the hypothesis that deviations from expectancy in a direction supporting one's hopes would result in positive affect and positive construal of the stimulus, while deviations from expectancy in a direction negating one's hopes would result in negative affect and negative construal of the stimulus.¹³

An important addition should be made to these statements by Harvey and Clapp. The perceived deviation of the stimulus from expectancy is a judgment *relative* to what is expected; it is not a categorical, "all or none" judgment. It follows that an individual may be positively affected by a negative stimulus (negative in terms of his hopes) if he perceives the stimulus to be less negative than he had expected. Thus our student, although hoping to pass the test, might respond positively to flunking it because he did not flunk it as badly as he expected he would; and a student who easily passed a test he expected to pass easily might not be affected as positively as the student who barely passed a test he expected to fail.¹⁴

Several characteristics of the subjects in this study are pertinent at this point. (1) All of them assessed international cooperation, understanding, and peace as "very desirable" goals (the hope condition), and (2) all of them expected the stimulus to be incompatible with these hopes; that is, they had very negative expectations about Radio Moscow and its programming. They expected it to be very slanted and very anti-United States

in content, consisting of blatant propaganda and "fanatical" attempts to change their minds (the expectancy condition). Also pertinent here for a full understanding of the hypotheses of this study is the point, to be documented later, that the broadcasts to which the subjects listened were indeed biased and noticeably negative to the United States, and were perceived as such by these American subjects. With these characteristics in mind, the following hypotheses may be derived from the foregoing discussion: (1) Listeners perceiving these negative broadcasts to be relatively better than their negative expectations will respond positively to the broadcasts. (2) Listeners perceiving these negative broadcasts as confirming their negative expectations will respond negatively to the broadcasts. (3) Listeners perceiving these negative broadcasts to be relatively worse than their negative expectations will respond most negatively to the broadcasts.

RESEARCH DESIGN

The research design consists of an experimental panel of 122 university students and two control panels of 43 and 54 university students respectively. This excludes, from an original experimental panel of 151 students, those individuals who had ever listened to Radio Moscow's broadcasts before. It is perhaps indicative of the success of our own country's political socialization that, in the original panel of 151 subjects, only 11 had favorable expectations of Radio Moscow's broadcasts; these individuals are also excluded from this report. The experimental panel listened to Radio Moscow's North American broadcasts one and one-half hours each week for two and one-half months—a total of 15 hours exposure. The broadcasts were monitored, taped, and replayed to the students usually within one to three days of their actual transmission.¹⁵ The subjects, all volunteers, submitted to a before-after questionnaire consisting of semantic differentials, opinion scales, and both structured and open-ended questions. The subjects were assigned a number at the beginning of the study, so that the before-after responses of each individual could be matched while protecting his anonymity.

As a control for any sensitizing effect to international news from other sources that might be created by participation in the study, control group I (CI) was fully informed about the research, and we attempted to instill a full sense of participation in these individuals. Subjects in control group II (CII) were unaware that they were a part of any larger study, and unaware that they would be queried again some two months later on the same issues.¹⁶

Utilizing Radio Moscow's practice of three one-half hour program blocks, which are rebroadcast in rotating order throughout the same evening, and some of which are repeated on still another evening of the same week, the experimental panel was presented with tapes which exposed them to each type of program in the same proportion in which it appeared on live programming. This included the usual news and political

commentary, scheduled programs such as "Science and Engineering," "Viet Nam Fights Back," "What is Communism," "Moscow Mailbag" (with its inimitable slogan, "You couldn't do better than write us that letter"), and short serials such as "The Pechala Family."

Several characteristics of the programming are particularly important. First, content analysis indicated that most of the programming did not deal with international political affairs *per se*.¹⁷ Aside from short news items, some political commentaries, and a few regularly scheduled programs on political issues, the broadcasts dealt mainly with such topics as urban planning in Moscow, descriptions of the educational system in the USSR, grain production, the rebuilding of the city of Frunze, the booming concrete and cement industry, and the excelling of work norms in tractor production—all quite descriptive and factual in character. Second, by both content analysis and a panel of 15 judges, the programs were evaluated as "moderately biased."¹⁸ These judges also rated the manner of presentation as "dull, boring, and unimaginative."

One striking exception to both of these observations, and one of particular significance in the analysis of results, was the issue of Viet Nam. The subject of news shorts, political commentaries, and a weekly feature of its own entitled, "Viet Nam Fights Back," this issue was frequently presented in a blatantly one-sided manner, characterized by highly charged negative statements likely to be viewed as incredible by an American listening audience, such as reports of U.S. troops ramming flaming bamboo splinters underneath the fingernails of captured prisoners, or U.S. troops pushing captured Viet Cong out of high-flying helicopters without parachutes.¹⁹

Several separate indices were used as indicators of the subjects' perception of the broadcasts in comparison with their expectations. The results reported here are based on the subjects' replies to questions in the after questionnaire which asked whether or not the content of the broadcasts, and the manner of their presentation, were what they thought they were going to be before they listened and, if different, how and in what way they were different. These items provide the basis for categorization of the subjects into those individuals who perceived what they expected (referred to hereafter as the expected group), those individuals who perceived the broadcasts to be worse than they expected (the unexpectedly worse group), and those individuals who perceived the broadcasts to be better than they expected (the unexpectedly better group).

RESULTS

Data are given here on the following items: the Soviet government (evaluated by semantic differential), separate measures of the subjects' views of the Soviet government's sincerity, the legitimacy of that government's actions in world affairs, and that government's actual desire for world peace (each item evaluated on a nine-point opinion scale), the Russian people, and American military participation in Vietnam (the

latter two each measured by semantic differential).²⁰ Since the subjects were continually exposed to the many reinforcement patterns of their own society while being exposed to Radio Moscow's broadcasts, we could hardly expect actual conversion of their opinions; consequently, the measurement here is of the *direction* of opinion change rather than conversion of opinion.

The initial results are given in Table 1. Even without any breakdown within the experimental group, it is clear that the broadcasts did have some impact.²¹ In Table 1 there is no significant difference between the opinion change occurring in CI and that change occurring in CII, an indication that participation in the experiment was not a significant factor influencing the opinions of the participants. On the other hand, there is a significant difference between the experimental group and CI (in the case of the desire item, CII) on all issues but Vietnam, an indication that the broadcasts did indeed result in considerable opinion change.

Table 2 shows the data bearing on the specific hypotheses of this report. Hypothesis 1 stated that those listeners who perceived the broadcasts to

^b All statistical tests in this table are X², two-tailed.

^c For purposes of this table it is assumed that opposition to the U.S. military participation in Vietnam would be favorable to the USSR.

be relatively better than their negative expectations would respond positively to their exposure. In Table 2 it may be seen that this unexpectedly better group consistently changed in a direction more favorable to the Soviet Union on all issues except Vietnam, an issue which, as we have noted, possesses considerably different characteristics. The change is particularly striking on such issues as sincerity (70 percent of the subjects became more favorable, while only 8 percent became more unfavorable), and on the semantic differential of the Soviet government, on which 63 percent of the subjects moved in a favorable direction and 7 percent became more unfavorable.

In contrast, on Vietnam, the one issue which was clearly dealt with in the "hard line" fashion the groups had expected, the unexpectedly better group did not move particularly toward the Soviet Union. Although we have no separate measure of their perception of this specific issue, subjects in the unexpectedly better group frequently indicated that on this one issue, they perceived the broadcasts to be as negative as they had expected.

Hypothesis 2 stated that those listeners who perceived their negative expectations to be relatively confirmed would be negatively affected by their exposure. In Table 2 the data are mixed for this hypothesis. On the issues of desire and legitimacy, individuals in this expected group did move in a direction more unfavorable to the Soviet government.²² However, they split evenly on the issue of the government's sincerity, and, on the measures of the Soviet government and the Russian people (both obtained by semantic differentials), they actually became more favorable (although certainly not as much so as the unexpectedly better group). These results suggest that under some conditions subjects who generally perceived the broadcasts negatively can be positively affected. It may well be that, just as the unexpectedly better group perceived the Vietnam issue differently from other issues, the negative expectations of the expected group were not confirmed on these specific issues. In future research separate measures of expectation should be obtained for each specific issue.

Hypothesis 3 stated that those individuals who perceived the broadcasts to be relatively worse than their negative expectations would respond most negatively. Although the N in this group is so small as almost to preclude the results from reaching a .05 level of statistical significance, opinion change in a direction more unfavorable to the Soviet Union is, as hypothesized, clearly the most pronounced among subjects in this group (see Table 2). Individuals in this unexpectedly worse group consistently moved in a direction negative to the Soviet Union on all issues except sincerity (on which they split in the direction of their opinion shift).²³ On the issue of desire, for example, 46 percent of the group moved in a direction unfavorable to the Soviet Union while 15 percent became more favorable. Even on the item of the Russian people, about whom all categories in the experimental group originally had rather favorable

opinions, the unexpectedly worse group responded quite negatively, with 46 percent becoming more negative, and 23 percent more favorable.

The subjects' open-ended replies on the after questionnaire flesh out the results of these before-after measures. Some excerpts from the unexpectedly better group illustrate the subjects' reactions:

- [1] A very silly effect, perhaps, but all of a sudden I realized that Russia's citizens are ordinary people.
- [2] You know, here we are always cast in the good guy role. It (the broadcasts) helps you to step back and get a possible view others might take of us and their reasons.
- [3] You begin to see that the Soviet Union is not a monster with atomic bombs in each hand; instead they're human, as concerned with human affairs as we are.
- [4] Through the dark and heavy mist, every once in a while I felt they really did seem to want world peace, at least those in control of the broadcasts, and as I look over the world situation as a whole, I can begin to see where this could be true.

Such replies are very similar to those we consistently get in interviews with actual American listeners to Radio Moscow's North American broadcasts. Frequent comments from the "real-life" audience are: "It makes you realize they are people just like us"; "You see that there are two sides to most of these international problems"; "You begin to see their side of the story too."²⁴

The open-ended responses also provide additional support for the theory entertained in this research—that the process involves a comparison of what the respondent heard with what he expected to hear:

- [1] I expected it to be one mass of making the U.S. look black and completely positive for the Russians. I thought I would hear more bad points than I did. I was surprised, they seemed so much like us. From the general idea we get in America we are told the Soviet Union is bad, so I assumed they would try to make us look bad too. They were fairly reasonable about it and it made me think maybe they really were trying to help us understand each other better.
- [2] You can't believe all they say, but they didn't hit us hard on the things I thought they would, like race riots, as if they really were trying not to make trouble.
- [3] I thought they would try to persuade me. Instead they played music and frankly answered those questions from Americans. They seemed so sensible about it all—makes you realize they're honest people trying to help international affairs.

There are undoubtedly many sociological and psychological factors at work to account for why some subjects perceived what they had expected in the broadcasts and some did not.²⁵ In our research so far, we have examined only one of these factors—dogmatism, with the more dogmatic individuals purportedly more resistant to opinion change and more prone to distort information to fit pre-existing opinions and beliefs.²⁶ There is some indication in these data that those individuals scoring high on the dogmatism scale perceived the broadcasts as they had expected them to be, while the low dogmatics found the broadcasts to be something different from what they had expected ($t = 1.37, p < .15$).²⁷

DISCUSSION

This study obtained a measure not only of the specific point on an opinion measure which a subject indicated most exactly characterized his

own position, but also the range of his acceptance and rejection of other positions on the opinion measure. The results of this study are accentuated when this additional dimension is taken into account.

This rather exploratory experiment leaves many important variables uncontrolled, and the results are legitimately subject to diverse interpretations. Nevertheless, they suggest some fruitful directions for additional research. For one thing, disconfirmation of expectancy in the direction of hope or goals seems to suggest why some opinions change—a welcome contrast to the abundant evidence we have on why opinions do *not* change. The results also highlight the fact that political opinion change is a sociological as well as a psychological phenomenon. In this study, the entire social system of the audience must be considered for a full understanding of the impact of Radio Moscow's broadcasts. The broadcasts seem to have had an effect, not because of any particular skill in communication, but because conditions in our own society had led the audience to hold unrealistic negative images which, upon actual exposure, were clearly refuted for many of the listeners. According to the replies of the subjects in this study, the domestic mass media were among those aspects of our society which played an important role in determining their response to these foreign broadcasts. The domestic media came in for specific censure from individuals in the unexpectedly better group as a prime source of their unrealistic expectations.²⁸

Some implications for traditional issues in international political communication may also be found in these results. To cite but a few, there is the issue of the comparative effectiveness of political communications that deliberately attempt to persuade and "propagandize," in comparison with a relatively candid and straightforward presentation.²⁹ The results of this study suggest that national groups which expect biased political persuasion from a source in another nation, and get (or perceive) the communication in that form, tend to respond negatively; national groups which expect biased political persuasion from a source in another nation, and do not get (or perceive) the communication in that form, tend to respond positively. Since most people are taught to expect political "propaganda" from their nation's adversaries, this fact has obvious implications for developing effective political communications to the people of other nations.

Related to this point is the political import of overtly nonpolitical content in international political communications. Having expected overt political persuasion attempts, but confronted rather with concerts, accounts of everyday life in the Soviet union, and descriptions of Soviet social institutions, the subjects frequently cited this overtly nonpolitical content as prominent in the refutation of their expectations. Many other areas of relevance could be cited, such as the relation of expectancy confirmation to the frequently noted "boomerang" phenomenon, and the value of side effects in political communication.

In sum, these results strongly suggest the value of continuing to

examine the factor of confirmation/disconfirmation of expectations in assessing the effectiveness of international political communications.

NOTES

- ¹ International political communication is considered here as the deliberate attempt by a communicator in one nation to further the political interests of that nation through the dissemination of messages to audiences in other nations by means of the mass media.

- ¹⁵ This taping took place between October 7, 1966 and December 15, 1966.
- ¹⁶ The before-after responses of this group were matched by social background data.
- ¹⁷ Generally, no more than 25 percent of a given evening's broadcast content dealt overtly with international political affairs.
- ¹⁸ All of the judges were students who had previously listened to Radio Moscow's North American broadcasts and who were familiar with the literature on opinion-attitude forma-

tion and propaganda. They listened to a one-hour sample of the same tapes presented to the experimental group and responded on a semantic differential.

¹⁹. Replies from the subjects (and the panel of judges) indicate that they did indeed view this material incredulously.

²⁰. The subjects' opinions on all items were measured on the evaluative continuum of favorableness-unfavorableness.

²¹. There were no significant differences in the initial opinions held on these issues by either the experimental group or the control groups.

²². Although the results do not reach the .05 level of statistical significance.

²³. The broadcasts appear to be particularly effective on the issue of sincerity. Again, the need is clear in future research to obtain measurements of prior expectations on each specific issue.

²⁴. Smith, "America's Short-Wave Audience."

²⁵. In this study 41 percent of the subjects perceived what they had expected in the broadcasts, 48 percent saw the broadcasts as better than they had expected them to be, and 11 percent found them to be worse than expected.

²⁶. Milton Rokeach, *The Open and Closed Mind*, New York, Basic Books, 1960.

²⁷. In interpreting these results, it should be mentioned that a highly shortened version of the dogmatism scale was used. See Rolf H. K. Schulze, "A Shortened Version of the Rokeach Dogmatism Scale," *Journal of Psychological Studies*, Vol. 13, 1962, pp. 93-97.

²⁸. Indeed, some of the respondents, finding the stance taken in the broadcasts to be so different from what they had expected, felt "betrayed" by American media coverage.

THE CHIEU HOI PROGRAM POSES THREAT OF SPECIAL DIMENSIONS*

BY HAMMOND ROLPH

This article illustrates the use of captured documents as a measure of the effectiveness of psychological operations programs. The selection is an assessment of the impact of the Chieu Hoi Program through textual and documentary material.

Ever since the Viet Cong insurgency reached serious proportions in the early 1960's, the Saigon government has had some kind of program for inducing defectors from the revolutionary movement. These were not highly organized or very effective, however, until the present *chieu hoi* or "open arms" plan was instituted about three years ago. Furthermore, the military situation in the earlier period did not favor Viet Cong defection. . . . The basic program was designed to persuade NLF soldiers and lower-level personnel to lay down arms and rejoin the national community, with assurances of full constitutional rights, a fraternal welcome, and material assistance. It was supplemented in April, 1967 by a National Reconciliation Policy specially aimed at inducing defection by higher-level Viet Cong military officers and political cadre leaders.

*Excerpts from "Viet Cong Documents on the War (III)," *Communist Affairs*, VI, no. 1 (January-February 1968), pp.21-25. Reprinted with the permission of *Studies in Comparative Communism* (successor to *Communist Affairs*) and the author, copyright holders.

Defections to date have been largely from the hamlet and village level and from the ranks of the local guerrillas and functional associations, but there have been some "ralliers" of distinctly greater importance, and recognition of the threat to the cadre structure is explicit in the NLF documents on the subject. A report . . . taken from a cache in the Iron Triangle area north of Saigon in Binh Duong Province during Operation "Lam Son 67" by the U.S. 1st Division, blamed the success of *chieu hoi* on poor security policies, loose personnel procedures, lack of vigilance, and weak ideology. It also recognized the key operative element in the defections: appeals from the families of Viet Cong members.

The Current Affairs Committee has published directives concerning internal protection against the enemy "Open Arms" activity. All echelons, organizations, and branches complied with this, but the results were limited. Secrecy preservation classes have been conducted for all cadre and personnel of all committee echelons, organizations, and societies. Some organizations have reestablished the personal history statement, controlled to some extent the internal political situation, set up protection teams, and constructed defense works to protect the organizations. This was successful in avoiding regrettable casualties to some extent. However, from time to time and in some areas, particularly at district and village levels, the preservation of secrecy was not strictly carried out. This was evidenced by the lack of secrecy in conversation. Moreover, the loss of documents was noted in some areas. The recruitment of soldiers and personnel was done without caution; defense against psywar and "Open Arms" was not rigorously undertaken. . . . As a result many soldiers and workers have lost spirit and become demoralized. There were also cases of dereliction of duty. This was common everywhere. . . . Some of our soldiers and cadres are misled by the enemy, have surrendered to the enemy, carrying important documents and weapons with them. As compared with 1965, the rate of deserters is higher. In some areas, the number of soldiers and cadre workers who deserted or defected to the enemy as a result of the appeals of their family amounted to 80 percent, and the number of village guerrillas, hamlet guerrillas and cadres and civilians was 70 percent. The rest were district-level cadres and higher (including workers, District and Province Concentrated Forces). Some defectors . . . have shown the enemy our base areas and installations, thus causing some damage to us, much political effect on the people, and reducing the people's absolute confidence in our cadres and soldiers. Worse still some people began to doubt our cadres' and soldiers' loyalty.

The above situation was caused by many things, primarily because of the failure to heighten the vigilance by the committee echelons and organization Party Headquarters. It was also due to: Failure to fully understand the principle of building up and defending the Party's revolutionary forces; failure to thoroughly understand the cunning scheme of the enemy; too little emphasis on ideological and political instruction which was designed to heighten the cadres' and soldiers' revolutionary spirit and awareness. . . .

In the near future, psychological warfare on a greater scale will be initiated by the enemy. Intelligence, "Open Arms" activities, and military activities will be increased in support of his resettlement and pacification activities. Other activities will include demagoguery and bribery. Indications are that television sets will be brought to rural areas to support psychological warfare and "Open Arms" activities.

To frustrate the enemy psywar and "Open Arms" plan, all committee echelons, Party and group agencies, and the commanding officers of the other organizations should understand that the building up of our forces and the security protection for our revolutionary forces are a common task. The protection of forces is as necessary as the development of forces. Without due protection, our forces will not last long before the cunning scheme of the enemy. . . .

* * * * *

Therefore, the security protection of the unit, defense of our revolutionary force against the enemy's psywar, *chieu hoi* and "appeal to surrender" attempts, at present, and in the future, constitute the most important and urgent mission. . . .

* * * * *

Continue to watch after the unit's political situation. We should grasp fast the people who have doubtful political tendencies or those who are still wavering. Cases of unclarity, signs of corruption, bribery, and demoralization should be halted in time, and each problem should be carefully judged, then solved logically and legally. Avoid mechanical settlements which may create antagonism in the internal organization. Concerning the suspected elements, the Party officials and security authorities concerned should submit proposals to the Party committee on the action to take against these elements and request that the committee echelon take drastic measures against them. The people who still have doubtful political tendencies but are not directly against us or considered dangerous should be continually educated, if they really want to progress, so they can adopt a decisive attitude and discern friends from foes. The core elements which assume key missions should be truly pure and clean.

The people in charge of recruitment should be careful and determined to put an end to easy and careless admission.

Special emphasis should be placed on the education of the servicemen's and soldiers' families in weak areas . . . the organizations should have a plan to contact the cadres' and soldiers' families and fight the enemy's dangerous attempts to lure them through their families.

A secret report from a district unit commander to his district committee . . . spoke bluntly of the difficulties the *chieu hoi* program is causing in his area.

An overall review of the Vietnam battlefield at the start of the winter and spring campaign shows that we have suffered both military and political failures. The enemy . . . intensified military action, and uninterrupted raids have eroded the will to fight of our army and people. Coupled with his military effort, the enemy has stepped up his perfidious *chieu hoi* campaign in his attempt at undermining our fighting spirit.

The impact of increased enemy military operations and *chieu hoi* programs has, on the whole, resulted in lowering the morale of some ideologically backward men, who often listen to enemy radio broadcasts, keep in their pockets enemy leaflets, and wait to be issued their weapons in order to go over to the enemy side.

* * * * *

They might betray the revolution by having their parents, wives, children, relatives and friends establish contact with the enemy to make arrangements for their eventual defection. They will steal documents, weapons and other equipment and cause us losses prior to going over to the enemy to betray the Revolution.

* * * * *

Addressees, upon receipt of this memorandum, will confer with their respective [Party] chapter committee authorities to work out plans for finding out these "bad elements," reeducating them as individuals and their units, as a whole.

On Nov. 20, 1966, the political department of the South Vietnam Liberation Army (the Viet Cong armed forces) issued a directive for action against the *chieu hoi* and other GVN-U.S. psychological warfare programs. The document was captured by a unit of the U.S. 25th Division in February, 1967.

The *chieu hoi* program, one of the most important activities of the enemy psychological warfare, is a national policy of the neocolonialist war. True to the nature of the U.S. imperialists and their henchmen, their psywar reflects aggression, reaction, and injustice. It is carried out under many aspects but its main purpose is to deceive, flatter or oppress us and impair our morale and ideology.

In an attempt to weaken our combat spirit and sow doubt and fear, the enemy uses the label of false independence, seduces our men with money, women and sympathy, or resorts to bombs. These factors are used to make our troops surrender.

Such a scheme is very dangerous. Therefore we must counter their psywar activities permanently in order to maintain the morale of the troops, their combat spirit and their firm viewpoint.

* * * * *

Our cadres still underestimate the value of the enemy's propaganda. Our men still listen to the enemy broadcasts and read enemy magazines and newspapers.

The political views of our troops are still insufficient and loose due to the ignorance of the enemy's cruelty. The enemy tries to increase the fear of sacrifice and encourages pacifism. As a result, a number of our soldiers have been influenced by the enemy's deceitful propaganda. . . .

Security maintenance is not properly observed by cadres and soldiers.

* * * * *

Defection occurs frequently in various armed forces. Many cases have resulted in disastrous consequences. Some have killed our cadres and soldiers, destroyed weapons and stolen secret documents before surrendering to the enemy.

* * * * *

Point out the danger of this scheme. Its influence is so bad that it weakens our ideology, impairs our combat spirit, and finally induces our cadres to side with the enemy and to become traitors.

The struggle against the psywar and *Chieu hoi* program is a class struggle. It is a long-range and complicated struggle during which we must increase indoctrination for class consciousness, lay bare the enemy's deceitful propaganda, and control our ideology and our organization closely.

* * * * *

To stop enemy influence, the first basic thing to do is to strengthen the personality of each of our cadres and fighters. . . . When one has a deep hatred of the enemy and a noble revolutionary ideal, one is immune to the threat of arms, the appeal of money and beautiful women, and the lure of deceitful tricks. Our cadres and soldiers must be taught how to make a distinction between right and wrong so that they will be able to help one another with the force of collectivity. This is the most revolutionary and effective way according to the Party line. When enemy propaganda reaches our units, we must on the one hand organize the collection of these documents, and on the other, proceed with the analysis of enemy materials with a view to unmasking his deceitful arguments in the eyes of the people. Do not underestimate enemy propaganda. Actually it does not affect anybody specifically. Its influence penetrates our minds day after day and will cause disastrous consequences. Therefore, we should heighten vigilance in order to expel it from our mind.

* * * * *

Provisions of the internal regulations must be strictly observed by cadres at committee levels. Listening to enemy broadcasts and reading enemy newspapers, magazines, and leaflets are forbidden. Provisions concerning the political administration in the unit and assignment of personnel to important units must be strictly observed.

* * * * *

Investigate the attitude of those influenced by enemy psywar operations and straighten it out in time.

* * * * *

Help and motivate families whose children joined the Revolution. We must make them believe in the revolutionary movement, take part in the resistance, and encourage their children to fulfill their duties. Point out the enemy's plot to bribe their children, induce them to side with them. This shows confusion and weakens our combat determination.

In a directive . . . from the Party Committee of Military Region I, entitled "Counter *Chieu Hoi* in the Armed Forces," the campaign to neutralize this dangerous GVN program is elaborated upon. There is no

attempt to minimize the impact of the political arm of the enemy's "two-pronged attack," and severe countermeasures are directed.

In the psywar and "Open Arms" programs, due to our failing to pay attention to cope with the situation and provide correct guidance, the enemy has been positively active and has achieved certain definite results among the people and among our armed forces, especially the guerrilla forces and regional troops. In recent years, they have attached much importance to that attempt and have organized the psywar branch from highest to lowest level and placed that branch under military command. They have also organized the "Open Arms" branch from central to district level, formed and sent many "Open Arms" cadres to work in close coordination with pacification cadres, intelligence agents, spies, U.S. advisers and their vassals, namely the Formosans, South Koreans, Malaysians, etc. . . . They have devoted to this task a great deal of money and reserved all available means for this task. . . .

* * * * *

Thus, it is obvious that the enemies have for a long time considered their attempts to induce our cadres and fighters to surrender and rally as a well-organized strategic plot, properly guided from top to bottom and involving the use of a great deal of money and means. All their attempts are directed toward the masses and especially toward our armed forces. At present, within the framework of their attempting to launch a two-pronged attack, the enemies are actively carrying out their effort to induce our people to rally in a well-organized manner and with more cruel and furtive plots. Concurrently, they also step up their fierce military activities. . . . a great majority of our cadres and fighters have proved themselves to be confident and have fought bravely to achieve greater and greater merits and feats of arms in really hard fighting situations which require them to surmount countless difficulties.

However, we must recognize that recently our enemies have achieved, through their "Open Arms" activities, certain definite results. This is because, on the one hand, they have been working actively and have resorted to many tricks and, on the other hand, because we really still have many shortcomings in our task of fighting against enemy attempts to induce us to surrender or rally through their "Open Arms" activities. . . .

Generally speaking, our cadres and fighters still underestimate enemy tricks and "Open Arms" activities and have failed to follow closely their tricks and activities to educate and guide their units to fight against and defeat these enemy plots. . . .

Cadres and fighters tune to various enemy radio stations, U.S. and British stations and the Saigon radio station, without regard to regulations prescribed by higher levels; listen to all kinds of news and "Open Arms" broadcasts through enemy programs of music and artistic performances. People also read enemy reactionary newspapers and magazines.

People are allowed to read enemy leaflets freely. . . . Some people even bring these leaflets to their offices to serve as wrapping paper or envelopes. . . .

Cadres and fighters who get in touch with their families often return with pictures of their family members. Among them are such people as puppet officers, GVN officials, security agents and policemen. They consider such pictures as free from all bad influence and keep them in their pockets. . . . Leading cadres are aware of this but have failed to take determined, constructive and adequate measures against such occurrences.

* * * * *

Leaders have not succeeded in controlling the state of mind and thoughts of each of the men in their units. . . . They have failed to follow closely and thoroughly understand the difficulties that must be overcome, so as to be able to prevent their men from being upset and pessimistic, thus vulnerable to enemy psywar.

* * * * *

Certain units have admitted many people into their ranks in a reckless manner and without regard to prescribed procedures and principles. They have freely accepted relatives and friends, whose "curriculum vitae" they do not thoroughly know about, into their ranks.

* * * * *

In certain units, cadres usually do not pay attention to the physical and spiritual life of their fighters. This is because they are inclined to think that it is taken for granted that their men will have to endure hardships, however great these hardships may be. Thus, they never pay attention to improving their fighters' way of living with means that are within their reach and capacity. Moreover, conditions in which cadres fail to share the sweet and the bitter with their fighters still exist at certain places.

* * * * *

... Party commissars and leading cadres in units and organizations are to reinforce and increase education in current matters in a continuous manner, with a view to showing people clearly our advantageous position and the weak position of our enemy.

These cadres must also educate their men to closely and constantly follow enemy plots and "Open Arms" activities, so as to design proper measures to cope with such situations in time.

Properly carry out regulations prescribed by the army concerning the question of listening to enemy radio broadcasts and reading enemy newspapers and magazines. Severely judge and exert disciplinary measures against cadres and fighters who transgress such regulations. ...

* * * * *

Concerning the dissension between China and Russia, leaders must explain to cadres and fighters that these are only certain differences of concepts that can be smoothly settled. Leaders are to emphasize the fact that, at present, China and Russia are actively supporting our people in all fields to defeat the U.S. aggressors. Leaders must also tell those who listen to Chinese and Russian radio broadcasts not to discuss any sensitive news before receiving official explanations emanating from the Party.

* * * * *

Party chapters, organization and unit commanders are to maintain firmly all activities of such organizations as the three-men cells in their units, pay attention to isolated elements operating in weak areas, assign hard-core cadres to keep well in hand the daily routine and thoughts of each person so as to discover any mistake and help correct it immediately.

Party chapters and organization commanders are to keep well in hand the family situation of each of their men, their strong points and weak points regarding their way of thinking, behavior, and psychology as well as their aspirations so as to constantly help them. And, especially with people who have committed certain mistakes, Party chapters and organization commanders are to analyze such mistakes, judge them, and create for them favorable conditions to progress and achieve merits instead of overcriticizing them and having prejudices against them.

* * * * *

... The question of getting in touch with family members must be thoroughly studied and correctly organized and carried out. However, in this critical situation, such contacts ought to be limited. Commanders must educate their men prior to their departure and motivate them to reeducate their family members. ... For people whose standpoint and thought are still shaky, commanders must not allow them to contact their families at once. In emergency cases and when facing righteous aspirations of these people, commanders are to assign some other people to go with them to strive to educate their families if this is possible. (Avoid causing people to think that we are doubting them when having them accompanied by some other people.)

* * * * *

... We must not, even when short of personnel, admit into our ranks doubtful elements whose "curriculum vitae" we do not know about, so as to avoid all possible infiltration.

* * * * *

Actively control and implement regulations guaranteeing the realization of democracy in organizations and units; raise to a higher degree the people's attitude toward Party chapters cadres and commanders; promote unity among the cadres and fighters; absolutely fight against despotic, bureaucratic, imperious, nepotistic, and militaristic thought and gesture among the ranks of the army, especially among the ranks of the cadres. . . .

Actively realize the . . . task of supplying our troops and taking care of the material needs of cadres and fighters within the reach of our capacity. . . . Absolutely fight against the thought of refusing to share the sweet and the bitter with everybody and striving to improve personal benefits.

* * * * *

In case we discover a cadre or fighter who induces some other people to desert our ranks, we are to thoroughly study the case to see whether that cadre is someone sent by the enemy or just a person who could no longer endure hardships and has resorted to such a wrong means.

If the man happens to be a real enemy, then we must deal with him in a proper manner. If he happens to belong to the second case, then we must reeducate and reform him right at the unit.

In case some cadres and fighters receive appeals from their families to return and inform us about such moves, we are to promote their revolutionary spirit and comfort them. We must also make public such a revolutionary spirit and have it studied by other people. Concurrently, we are to consolidate their thought and strive to prevent them from being shaken by other appeals that will be launched by their families at other times. Finally, we are to motivate people to write letters to build revolutionary concepts for their families or inform regional authorities to take care of that work.

It is evident from the above directive that restoration of discipline is a mixture of persuasion and coercion, with the former preferred whenever possible. The NLF leaders apparently realize that Draconian measures would tend to erode the psycho-political underpinnings of the revolution. References to the requirement that cadres share "the bitter and the sweet" with their subordinates are frequently seen in Viet Cong operational and training documents dealing with criticism and self-criticism. There is no evidence, however, that such directives are ever put into full effect. In fact, gross inequality between cadres and rank and file (particularly in food rations and access to sexual pleasures) is built into the system.¹ Furthermore, some Communist POW's have expressed surprise at the degree to which combat dangers shared by American officers with their men exceed those to which NLF cadres expose themselves.

ON ANALYZING PSYOP CAMPAIGNS BEFORE USING THEM*

BY RICHARD H. ORTH

CONSIDERING POTENTIAL EFFECTIVENESS

In attempting a persuasion campaign, it is best to use a step-by-step procedure. First, the PSYOP planner decides which attitudes or behaviors are to be changed. Next he determines the desired direction of the change, and then he writes the message. If the message is to go to an audience that does not speak the writer's language, it is translated into the language of the audience. (If there is time, the message may be translated back into the original again to check the adequacy of the translation.) Then the message is disseminated via the available media and one hopes for the best.

The PSYOP planner must then assess the effect this campaign had on the target audience. This he can do in several ways. He could make surveys or he could analyze the media of the target, or he could note the effects of the audience. If the campaign appeared to work, there is a feeling of satisfaction over a job well done. If it did not work, a plethora of rationalizations are available either from the technical literature or from the contingencies of the situation. For example, if leaflet drops were used as the distribution method, one can easily blame the lack of success on bad luck (that is, high winds, skirmishes, and the like).

If, however, the PSYOP evaluator dwells only on the determination of success or failure, he does not gain any insight into the factors that caused the success or failure. When operating in the field, clearly the psyoperator does not have the luxury of addressing himself to all, or even a portion, of the factors that may enter into the persuasion process. The question then becomes, what can and should he do to anticipate the potential effectiveness of a campaign. An answer may be found in W. J. McGuire's analysis of the persuasion process.¹ Although this analysis is specifically meant to deal with some aspects of personality and persuasibility, it can reasonably be extended to other areas of the persuasion process.²

THE THREE-FACTOR THEORY

The model proposed by McGuire has been labeled the "three-factor theory." The name of the theory is derived from the three factors examined: (1) receiving, (2) yielding, and (3) opinion change. Essentially, it says that the likelihood of opinion change derives from the answers to two questions. Although the two questions may seem oversimplified, they really go to the heart of the issue as will be shown later. The

*Original essay by Richard H. Orth.

questions are: (1) what is the probability that an individual will receive* the message and (2) what is the probability that he will yield** to the message. The combination of these probabilities gives the probability of opinion change taking place. An example could be the effects of intelligence (mental acuteness) on the probability of receiving the message and of yielding to it. It seems reasonable to expect that the more intelligent the individual is, the more likely he would be to understand the message. Moreover, one would also expect that the more intelligent he is, the less likely he would be to yield to the message. This expectation comes from the notion that the more intelligent person would be more likely to have considered the arguments being presented and to have dismissed them as not being sufficient to support their side of the question.³ It is suggested that the probability of opinion change is the product of the probability of perceiving and the probability of yielding. Thus, we have the equation:

$$\text{Pr}(O) = \text{Pr}(R) \times \text{Pr}(Y)$$

where $\text{Pr}(O)$ is the probability of opinion change, $\text{Pr}(R)$ is the probability of receiving, and $\text{Pr}(Y)$ is the probability of yielding. This equation can be plotted graphically as shown in Figure 1.

*Note: Since probabilities range between zero and one, they are really fractions. Multiplying by a fraction serves to reduce the absolute value rather than to increase it as would be the case with whole numbers.

FIGURE 1

Examination of Figure 1 shows that opinion change is least likely to occur at the extremes of intelligence and most likely to occur in the middle ranges of intelligence as discussed in the text above.

*The term "receive" is used here to indicate understanding or attending, it is a general term to indicate whether or not the message gets through to the target.

**The term "yield" is used here to indicate an acceptance of the content of the message.

THE THREE FACTOR THEORY AND THE COMMUNICATION MODEL

Obviously, the intelligence of the target audience is not always the crucial factor in the PSYOP situation; it is even less often known. However, the three factor theory may still be of utility to the psyoperator once its elements are related to the general model of the communication process. The most frequently cited model of the communication process is diagrammed in Figure 2

FIGURE 2

As originally conceived, the three factor theory concerns itself only with the receiver, with some concern for the decoding process. The model, as will be shown in the following text, can easily be expanded to cover all the elements of the communication system. The probability that a message will be received is not only affected by the characteristics of the receiver, but also by the channel and by the encoding process. The probability of yielding, again, need not be dependent only on the receiver but also on the sender and the channel. For example, a message encoded into Spanish will have a low probability of being received (that is, little impact) in Vietnam; a message delivered by a woman to a male Cua tribesman would have a low probability of yielding, since women have much lower status than do men among this tribal group.⁴ In summary, various aspects of the communication (persuasion) process can be considered in light of the three factor theory. More detailed information on this process will be presented in the following portions of this essay.

THE SENDER

The nature or qualities of the source of a message have received attention for many years. Usually the investigators subsume all the source qualities under the rubric of "credibility," and the caveat for persuasion attempts is to use a credible source. This oversimplification is of little assistance in most PSYOP applications. First of all, often no source is cited. Secondly, when it is evident, the source of a message is usually an impersonal one (that is, a nation, an army, and the like), for which some aspects of credibility are difficult to determine.

The following set of questions should be of concern to the psyoperator in attempting to deal with source problems in a campaign:

1. Who will be thought of as the source of the message?
2. To what degree will the source be seen as being similar to the receiver?
3. Is the source likely to benefit from the proposed opinion?
4. What is the record of the source on past campaigns?

5. Is the source knowledgeable about the problem discussed in the message?

It has been shown that the receiver is more likely to be swayed by a source that resembles himself than by someone else. Using the three factor theory this consideration is diagrammed in Figure 3.

Figure 3. Similarity Between Source and Receiver

Keeping this basic idea in mind, we can diagram a specific situation likely to arise in a conflict situation. Many campaigns are organized around the idea that a defector from the enemy should be used as the source. Thus, an officer who has defected is asked to write a message suggesting that more of his former comrades join him. The principle, as can be seen from Figure 3, seems sound on the surface. This source is much more like the target than anyone from the psyoperator's side. Yet if the psyoperator asks question number three ("Is the source likely to achieve some gain?"), his conclusions might be different. An individual defector has much to gain (easier treatment, money, and the like) from taking the side of the former enemy. As a consequence, an appeal focused on one such source may well be doomed to failure. Figure 4 shows such a situation graphically.

Figure 4.

The probability of yielding is derived from the combination of two different probability curves as shown in Figure 5.

Figure 5*.

* $Pr'(Y)$ is the probability curve for the similarity and $Pr''(Y)$ is the probability curve for the potential gains: $Pr(Y) = Pr'(Y) \times Pr''(Y)$.

This discussion should serve to illustrate the need to criticize the accuracy of our perception of the credibility of the source as well as the perceptions of the targets before the campaign is initiated.

ENCODING AND DECODING

The encoding process involves putting a thought or idea into a form which can be communicated. In contrast, the decoding process takes the form in which the idea was transmitted and puts it back into a thought or idea. For example, a person has a mental image of a joke. He translates that into spoken language to "tell" the joke to a friend. The friend then translates the telling (words) back into a mental image. Although this seems like a relatively simple process, its difficulty is illustrated in that not all people will laugh at the joke. The process can break down in a number of respects, that is, the mental images created in the receiver were not the same as the ones held by the source.

In analyzing a proposed campaign, the psyoperator should ask several questions including:

1. Is the language used by the encoder the same as the language of the decoder?
2. Is there a similarity in the past experiences of the two elements?
Do they have like frames of reference that can be drawn upon?

Whereas the analysis of the source most often involves the probability of yielding, for the present elements (encoder and decoder), the probability of receiving is also usually involved, but the yielding factor becomes more important. The following example should serve to illustrate the process for analyzing the elements of encoding and decoding. Once again, let us assume that the sender is a defector from the enemy forces and the campaign is aimed at the soldiers in the forces he came from. Furthermore, let us assume that he was an officer in his former position.

Consider now simply the encoder and the decoder. (Note: again, we are using the terms encoder and decoder to imply a processing agent within

the individual that transforms thoughts into language and language into thoughts, respectively. They are mechanisms possessed by the individual, but are not the individual himself.) The analysis is quite straightforward. For example, ask the question: "How similar are the frames of reference of the two elements?" The graph representing the probabilities for this consideration is shown in Figure 6.

Thus, the more alike the frames of reference, the more likely that opinion change will occur. A specific example would be whether the officer concentrates on the strategic and political factors behind the value of surrender rather than on the tactical and corporeal factors. The decoder, if he is an ordinary soldier, will most likely use the latter as a frame of reference, and the message will have little effect on him if the encoder uses the former as his frame of reference.

THE CHANNEL

At one level, the analysis of the channel is extremely simple. One need only ask: Is the channel one that is available to the target? The probability of yielding does not enter into this question. If the answer is no, the probability of receiving the message is zero, and, consequently, the probability of opinion change is also zero. If the channel is available to the audience, then additional questions can be asked involving yielding as well as receiving.

1. Is the channel one that is trusted by the target?
2. To what extent does the channel reach the audience?
3. What characteristics in the channel can create interference in the transmission?
4. To what extent are the interfering characteristics present?

Again, following through with the example of the defector suggesting surrender to his former comrades, what would be the effect of utilizing leaflets? Assuming that the means of distributing them is available, how much trust does the target have in them? It is reasonable to expect that if the audience had been exposed to leaflets before and the promises contained on them had not been kept (or not perceived as having been kept), it will assume that the contents of the leaflets are worthless. The results of this analysis are shown in Figure 7.

*Note: The conditions are such that reception ($Pr(O)$) has virtually been guaranteed.

Figure 7

In summary, it is obvious that consideration of the channel is important. However, often the data one needs are not available, nor does one always have the luxury of deciding what channel should be used. Under the latter circumstance, if one has analyzed the previous effects of using the channel, one will still be able to estimate what to expect from the campaign, and will not be at a loss to explain why the campaign had little or no effect.

THE RECEIVER

The importance of the receiver in determining the effectiveness of a planned campaign cannot be overemphasized. What characteristics should be examined? The following list is intended only to be illustrative, not exhaustive. (Each question can either refer to one individual or a group of persons.)

1. How strongly held are the receiver's views?
2. What are his group memberships?
3. What are the commonalities in basic personality variables among a group of individuals?
4. What data are available about the intelligence level of the receiver?
5. What is the receiver's previous experience with propaganda efforts?
6. What are the cultural variables that can affect the receiver's predisposition toward mass communications?

Continuing with the same illustration, let us ask the question of how committed the target is to his current opinions? First, examine the probability of receiving. There is some indication that as commitment becomes stronger the individual will be more likely to give his attention to messages related to the opinion he holds, but this is true only up to the

point where his commitment is so strong that he will simply not attend to any alternatives. On the other hand, the probability that he will yield should decrease steadily as he becomes more committed* to his opinion.

Figure 8

Figure 8 shows how this looks graphically. This suggests the following hypothesis: if an individual is at the extremes of commitment, he will be less likely to change his opinion. Thus, it would be more efficient to launch a campaign directed at another, related area when this is found to be the case. It is reasonable to expect that if a number of related opinions can be changed, the target will be likely to move along the continuum of commitment to an area where he will be more susceptible to efforts to change that opinion.

SUMMARY

In this essay the three factor theory has been used to analyze the potential effects of various states of elements in the communication process on the likelihood of completing a successful PSYOP campaign. Although the elements were discussed separately, they are closely related. If one follows through the example used in this essay, it will become obvious (from the fact that the same situation was used throughout) that all the elements should be examined and that they are related. For instance, while the decoding process and the receiver were discussed separately, the former is clearly a part of the latter. The receiver's intelligence level will determine some of the constraints of the decoder.

From the above paragraph, it should not be assumed that separating the elements is not beneficial to an analysis of effectiveness. Indeed, it is often necessary for the following reasons. First, if all the elements are lumped together before the final analysis, it is easy to forget one that will turn out to be critical. Second, data (or impressions) about certain elements are often scarce or unavailable and there may be a temptation to skip the entire analysis if this is true. Last, it is better to have knowledge about a portion of the process than none at all.

*Commitment increases, for example, as more people are aware of his opinion concerning a particular issue.

It should also be reiterated that no actual numbers need be used in the analysis and the actual shape of the graph (whether it is a straight line or a curve) is not important. The important factor is how the rough shapes, if they had actual numbers, would determine the outcome. We are dealing with fractions, and if one fraction is extremely low, it will decrease the other drastically.

CONCLUSION (CHAPTER IX)

EFFECTIVENESS OF INTERNATIONAL PROPAGANDA*

By L. JOHN MARTIN

Most propaganda is facilitative communication, not persuasive communication. Confusion of the two has impeded the search for effective measures of communications effectiveness.

It is impossible even to estimate the amount of money that is being spent on international propaganda. Knowing the budgets of the propaganda agencies of individual countries would be inadequate, since their sum is only a fraction of the total amount involved. The major effort appears in the guise of numerous official activities that do not go by the name of propaganda or by one of its euphemisms. It is safe to assume that the international outlay on propaganda is in the hundreds of millions of dollars. Hardly any country is too small or too poor to invest in it. One can say this quite authoritatively without extensive investigation for one simple reason: there is no consensus either among the practitioners or among the theoreticians as to what constitutes propaganda. Definitions range from very specific types of messages transmitted through very specific types of media for every specific end—to deeds that often in

*Excerpts from "Effectiveness of International Propaganda," *The Annals of The American Academy of Political and Social Science*, Vol. 398 (November 1971), pp. 61-70. retrospect, result, or are intended to result, in particular behavior on the part of the target. With this latitude in interpretations one can fearlessly make statements such as the above.

By any definition, the amount of money and effort that goes into what people take to be international propaganda—including the people who pay for it—is impressive. For purposes of this article, I will define *Propaganda* as a persuasive communicative act of a government directed at a foreign audience. I would have liked to exclude the activities of the diplomatic corps when they are dealing with their counterparts in an official exchange; but nowadays that is difficult. In the old days, such activity was called diplomacy. Today, the target of international propaganda quite frequently is made up of government officials, and the channel or medium often is the interpersonal relationship of a cocktail party. Yes, one might say, but the message is different. A diplomatic exchange is legally, or at least diplomatically, binding. Propaganda is not. This is cold comfort. Often nowadays, diplomatic moves are publicized through the mass media, while diplomatic exchanges are repudiated without qualms.¹

The expenditures on international propaganda are especially remarkable in view of the fact that there is very little assurance that the activity will have the desired effect; frequently there is very little indication that the propagandist knows what effect he desires, nor does he have any theory as to why his propaganda activity is likely to produce a particular effect. Such a theory is necessary if he is to satisfy economy-minded guardians and disbursers of the public funds, who normally insist on evidence of effectiveness. As Edward A. Suchman has pointed out, "A test of 'Does it work?' presupposes some theory as to why one might expect it to work."²

What will come as the greatest surprise to most people, however—not least to the propagandist himself—is that by far the largest chunk of the propaganda budget is not spent on propaganda at all. It is spent on what I shall call *facilitative communication*. This is an activity that is designed to keep lines open and to maintain contacts against the day when they will be needed for propaganda purposes. It is a ploy that is familiar to the newspaper correspondent faced with a press conference and a limited number of telephones on the premises to phone back a hot scoop. He puts an assistant on a phone to his home office and thus keeps the line open until he is ready with his story.

Facilitative communication by international propaganda agencies most frequently takes the form of radio newscasts, press releases, books, pamphlets and periodicals of a general or technical nature, artistic and other cultural programs, exhibits, films, seminars, language classes, reference services, and personal social contacts. None of this, naturally, is engaged in or performed with any conscious, limited objective other than the generally conceded hope of creating a friendly atmosphere, or, as a psychologist might put it, a favorable *affect*.

I have made no systematic study of the content of the world's so-called international propaganda as opposed to its facilitative communication, but my educated guess is that in peacetime, between 95 and 99 percent of the communication activity that is paid for by governments—because they think that engaging in international propaganda is the “in thing” to do—is really not propaganda at all. Ironically, few governments will publicly admit that they are engaged in propaganda because of the pejorative meaning the term has acquired. They prefer such euphemisms as *information program* or *cultural activity*. But for budgetary purposes it is justified as propaganda and serious efforts are made to measure its effectiveness in terms of its persuasiveness.

TYPES OF COMMUNICATION

I have defined propaganda as a persuasive communicative act. All communication is purposive by definition,³ but not all communication is necessarily persuasive in intent. Besides propaganda, there are other forms of persuasive communication, such as advertising, education, and political campaigning. These differ from propaganda in source, purpose (or content), and target. What they have in common is the process. They are all forms of communication. The question is, how effective are they?

There is no doubt that one human being can affect and even persuade another through communication under certain circumstances. All communication, no matter how insignificant (even a brief “Hi!”) leaves a mark on the receiver. Communication specialist Wilbur Schramm likens the effect to calcareous water dripping on a stalagmite. Occasionally a drop leaves an especially large deposit, but generally it merely contributes to the imperceptible growth of the spur. There is some empirical evidence of this lasting effect. Psychologist Harold E. Burtt, for example, occasionally read passages from Sophocles to his two-year-old son in the original Greek. He did this daily for three months, then put the experiment aside until the child was eight years old, when he had the boy memorize a number of selections. He now found that it took a significantly larger number of repetitions for the child to learn passages he had never heard than it took him to learn the ones he had heard six years earlier—a clear indication of a residual effect.⁴

The question, however, is not whether communication leaves a mark—that is, whether it is purposive—but whether it is effective. Effectiveness by definition assumes a *predetermined* outcome. One cannot speak of effectiveness—that is, attaining an intended or expected objective—unless one has a prior objective in mind. This, in essence, is the connotative meaning of persuasion. Purposiveness does not have that connotation. It does not necessarily imply movement or change. Persuasiveness does.

Is persuasive communication effective, then? Generally, the answer is, “No, it is less than effective.” Raymond A. Bauer of the Harvard Graduate School of Business Administration has pointed out, for in-

stance, that an advertiser seldom expects more than 2 to 5 percent of his target audience to be influenced by his message. Is this effective? Is it .02 to .05 effective, but it could represent new sales of 150,000 to 400,000 if his medium is a magazine with a circulation of seven to eight million. A politician would probably be happy with a persuasive communication that was 10 to 15 percent effective, while a teacher would expect at least 70 to 80 percent effectiveness, realizing that 100 percent effectiveness is a pipe dream. There is an interesting difference between the advertiser and politician on the one hand and the educator on the other. The first two often (though perhaps not always) have very specific objectives when they engage in persuasive communication. Generally, these center in the cash register or the ballot box. The educator, on the other hand, frequently has only a vague notion of his objectives. The tests and exams used in measuring the effectiveness of his "persuasive communication" are, therefore, often attacked by those taking them as "subjective" and "unfair"—meaning that the tests do not adequately measure the effectiveness of the persuasive communication.

The propagandist has much in common with the educator. As I pointed out above, most of the time he is engaged in facilitative rather than in persuasive communication and, ironically, most of the time he does not realize it. As a result, he searches feverishly but, naturally in vain for evidence of his effectiveness, so that he can justify his continued existence to the controllers of his budget. What he ends up with—and this is true of propagandists the world over—are some figures that attest to the effectiveness of his facilitative communication.⁵ But not realizing that this differs from persuasive communication, he feels guilty and frustrated about having to present clearly inadequate data.

Yet there is a fundamental difference between the measure of the effectiveness of persuasive communication and that of facilitative communication. The former is measured from the top down. The objective is to persuade a given target, and effectiveness is approached though seldom attained. In fact, by the time it is attained the objective has changed, since objectives in international propaganda are defined and circumscribed in terms of time, space, and publics. The effectiveness of facilitative communication, on the other hand, is measured cumulatively from the bottom up. Since its objective is to open or to maintain channels of communication with a given individual, group, or public as potential future targets, effectiveness is measured incrementally, rather than decrementally as is the case with persuasive communication. One can only be more effective, not less than effective. Everyone is potentially a target and must be counted, until a specific objective involving persuasive communication specifies and delimits the target. Obviously, propagandists would just as soon their open channels were never put to the test, since that would involve decremental measurement, in which they almost invariably come out relatively poorly.

HIERARCHICAL IMPACT MODELS

Facilitative communication requires no more than exposure as evidence of effectiveness. If we think in terms of a hierarchy of impact measurement, beginning with the input of the propagandist and ending with a change in the behavior of the target, we can conceive of several intermediate points at which measurement is feasible. Besides measuring input in terms of the number of hours of broadcasting, pages, pamphlets, pictures, periodicals, projections, or what-have-you emitted by the propagandist, one might measure the number of people exposed to the input. Many communication specialists ⁶ say that the next step in the hierarchy of the effectiveness process is awareness, which involves a conscious knowledge of the subject. Nothing will happen unless the communication can carry the individual on to the interest stage and, possibly, an evaluation stage, which requires an understanding and a "reception" of the message. This is followed by an acceptance, trial, or yielding stage, often thought of as a stage in which attitudes are changed. I refer to this as "collimation of the receiver's cognitive world," since what happens is a realignment or reorientation of a person's attitudes, values, opinion, and behavior within his "reality world." This may be likened to a magnet passing over a piece of iron and changing the orientation of its molecular magnets; only, here the change is in the salience (that is, the psychological closeness of an object to a person) and pertinence (that is, the relative importance of objects) of the situations, objects, and people in his cognitive world.⁷ A final adoption or behavioral change step is suggested by some communication specialists, which involves overt action on the part of the target. This, in my opinion, is tautological, since behavior follows from the readiness to act when the opportunity presents itself, and this is inherent in a person's attitudinal orientation.

This hierarchical model encompasses two distinct processes rather than one. The first is the process of facilitative communication that begins with input and ends with exposure. With exposure, the process has been completed. The line of communication is open and that is its sole purpose. The question of efficiency may be raised: What is the cost-per-exposure of opening and maintaining this channel of communication? But effectiveness is achieved once a single contact is made. The second process involves persuasive communication, and begins with awareness. Awareness is clearly unnecessary for facilitative communication; it is crucial for persuasive communication. The step from exposure to awareness is a quantum jump because it moves communication from the physical plane to the intellectual. It is a step that some people can never take because of intellectual or educational deficiencies. John R. Mathiason, studying the urban poor in Venezuela, found that exposing them to more mass media was futile since they had not been trained to process the information transmitted to them. "The poor of Ciudad Guayana have difficulty defining their situations," he concluded.⁸

VALUE OF FACILITATIVE COMMUNICATION

Does facilitative communication have any propaganda value? Yes, it has been shown that familiarity itself tends to create a positive feeling toward an object or subject. Numerous experiments using Chinese characters, nonsense syllables, and human photographs support the theory that repeated exposure—that is, familiarity—creates a favorable attitude toward an object. True, people will tune to a novel stimulus or situation in preference to a familiar one when they have a choice. But exploration or search for novelty correlates negatively with liking.⁹ In this sense, therefore, as Marshall McLuhan would say, the medium is the message.

There are two caveats, however, in a propaganda situation as opposed to a laboratory experiment. The favorable *affect* (that is, feeling or emotion) toward the channel—say, the Voice of America—engendered by mere familiarity may be tempered or even reversed if the original attitude of the target either toward the communicator or toward his message was negative. This will be discussed in more detail. Secondly, the positive feeling is limited to those who voluntarily expose themselves to the channel, and this, in turn, raises two questions: Were these people friendly to the channel in the first place, or did they become friendly as the result of exposure? And, more importantly, when at some future date it is necessary to transmit a persuasive communication—that is, propaganda—through the channel, will those who have been linked to it by facilitative communication also be the target of the prescribed persuasive communication?

PERSUASIVE COMMUNICATION

And now, finally, we come to the pay dirt in the propaganda mine. How effective is propaganda, which by all definitions is *persuasive* communication? This question has plagued and intrigued communicators the world over, although it was not studied systematically until the twentieth century, which happens to coincide with the period of the development of social science.

Both inductive and deductive approaches have been tried.

INDUCTIVE APPROACHES

The inductive approaches are exemplified by the applied research begun by the Army's Information and Educational Division during World War II and contained by Carl I. Hovland and his colleagues in the Yale Communication and Attitude Change Program. These researchers and others who proceeded along the same lines of enquiry examined the effects of communication through controlled experiments in which they carefully subjected one variable after another to the test. Their findings have included the following:

1. The Communicator

A credible persuasive communicator—and, in most instances, a likeable one—has a great initial advantage over a non-credible communicator. A credible source is one that is seen to be “trustworthy” and “expert,” although researchers have found it hard to disentangle the two attributes. It helps if the communicator also appears to have views in common with his audience. The initial advantage of credibility disappears a few weeks after the message is heard, the tendency being to forget who the communicator was. This is called the *sleeper effect*. Other factors, such as age and appearance, have been found to enhance a communicator’s effectiveness under certain conditions. Unfortunately for the propagandist, credibility, attractiveness, and similar positive attributes are not characteristics of the communicator but are judgments of the audience.¹⁰ In other words, the propagandist has little control over them.

2. The Message

The effectiveness of propaganda is increased if its message fulfills a need or an aspiration of its target and if it agrees with existing values, attitudes, opinions, beliefs, norms—or whatever one would like to call them—of the audience. It was also found that presenting only one side of an issue is more effective than presenting two sides when the audience is not well educated, already convinced, and unlikely to hear the other side; that presenting both sides of a case is more effective with those who are well educated or initially opposed, and that in general, two-sided presentations tend to inoculate against future counterpropaganda. Effectiveness of a communication is influenced by the order in which the pro and con arguments are presented, but the differential effect depends on the number of sources, how the message is introduced, what happens before or after each side is presented, and the type of audience. Fear-arousing and threatening communications have in some cases been found to be directly related, and in other cases inversely related, to effectiveness. The same is true of emotional as against national presentations. A liked message has a better chance of being remembered than a disliked one, a selected message better than one that the audience chanced onto. One fact pervades all these studies: every variable appears to interact with audience factors over which the communicator has no control.

3. The Medium

Because of the great difference in the cost of communicating through the various mass media, much emphasis has been placed by all “persuasive communicators” on determining the differential effects of the media. The findings have been very disappointing. While a cross section of the public is reached by each medium, with a small decline in magazine readership and a large one in book readership at lower educational levels, each channel—by which I mean the specific radio or TV program, newspaper, newspaper column or page, magazine, and so on—has a very

distinctive audience with little overlap.¹¹ Given the same audience segment, researchers have found no consistent pattern of advantage in one mass medium over another. Joseph T. Klapper, in his often quoted study of the effects of the mass media, concludes that

*All other conditions being equal, as they are in the laboratory, face-to-face contact is more efficiently persuasive than radio, which in turn is more efficient than print. TV and films probably rank between face-to-face contact and radio, but this latter point has not been empirically demonstrated.*¹²

He goes on to say that all other conditions are rarely equal in real life. This is an understatement. They can rarely be made equal even in the laboratory, as numerous studies, especially in the field of education, attest. Much depends on the communicator, and this carries over into intimate, face-to-face communication. Not only does interpersonal communication of necessity reach smaller numbers than communication through the mass media, but the impact of the communicator is more vivid and is likely to have a negative effect if he is attempting to persuade individuals on a matter involving personal values.¹³

4. The Audience

More than anything else, effectiveness of persuasive communication depends on the past history of the receiver of a message—the ground in which the seed is sown. This includes the cognitive system—the values, attitudes, beliefs, opinions—and the habitual behavior patterns of the individual, which in turn, also depend on such idiocratic factors as age, sex, education, socioeconomic status, geographic region, and race. Equally relevant are such personality factors as need for social approval, aggressiveness, authoritarianism, high versus low need for clarity or simplicity, self-esteem, and whether the target is particularly topic-bound, appeal-bound, communicator-bound, media-bound, style-bound, or situation-bound. People, it has been found, expose themselves selectively to messages, although it is no longer believed, as it once was, that they will tend to expose themselves only to supportive communications. They will tend to perceive selectively, or, more correctly, their retention is selective, since they must have perceived a message before deciding to reject it. Finally, the pressure of group norms tends to inhibit attitude change except insofar as the group itself is changing in its values.¹⁴

DEDUCTIVE APPROACHES

The deductive approaches to the study of communication effects have started out with either a behavioristic or a cognitive theory of attitude formation.

Behaviorists

The behaviorists such as Leonard Doob, Burrhus F. Skinner, Caryl Bem, and Arthur and Carolyn Staats base their theories of attitude change on learning theory. Theirs is essentially a hypodermic model of attitude formation and modification, in which a communication stimulus

leads to an observable opinion or behavioral response mediated by an attitude. This, in turn, is a tendency, learned through conditioning, to respond in a given way.

Cognitive Theorists

The cognitive theorists such as Leon Festinger, Fritz Heider, Charles Osgood, and Theodore Newcomb have developed consistency models that explain attitude modifications in terms of a strain toward balance in the beliefs and emotions of the individual. It is a homeostatic model in the sense that a person tries to maintain a logical consistency in the things he knows and likes. Thus, if A likes President Nixon but doesn't like his China policy, he will attempt to restore cognitive balance either by changing his attitude toward Nixon or by modifying his attitude toward China. Festinger would add that he is liable to reduce his dissonance by refusing to believe that Nixon holds those views, or by misperceiving the news, or by minimizing the importance of China, or by forgetting what the President said.

These theorists not only explain why and how attitudes are formed and modified but also try to predict the outcome of a communication effort in terms of their theories. The models occasionally lead to incongruous conclusions. As Festinger once pointed out, regardless of how much a child likes Popeye, he can't be made to like spinach. Yet balance theories tend to suggest that he can. Festinger's dissonance theory has some useful applications to the analysis of persuasive communication if one can first measure the attitudes of the target on relevant factors. Sometimes the predicted behavior fails to materialize, which has led to the suggestion that "dissonance theory is almost Freudian in its ability to explain data, no matter how they come out."¹⁵

There are other deductive approaches that attempt to explain why people are influenced by persuasive communication, but they tend to be extensions of the two described above. One is based on the perceptual theory of Solomon Asch and on Muzafer Sherif's assimilation-and-contrast theory, suggesting that attitude change is due to a change in pertinence, or the relative importance of objects, rather than to a change in a person's feelings about the object. Another theory is based on the functional approach of Daniel Katz, who says that a person's attitudes are tied to his need system or ego-defensiveness. Any changes in his attitude would be due to a change in his psychological need.¹⁶

EFFECTIVENESS OF PROPAGANDA

In both theory and practice, persuasive communication has been shown to have an effect. But this is a far cry from evidence of effectiveness. Nor is effective persuasion necessarily the same thing as effective propaganda. If we could select our audience on the basis of certain idiocratic factors—objective physical and personal characteristics peculiar to an individual, such as age, sex, race, education—we might increase by a

statistically significant fraction the proportion of those influenced by a message. But we would have no control over such factors as personality and susceptibility to persuasion, existing values, beliefs and opinions or attitudes toward the objects, subjects and situations involved in the persuasive message. We can choose our communicator but not determine his image. We can select the vehicle of transmission but not the channel of reception of the target of our communication. We could maximize the effect of all these factors for a single individual, especially if we were able to subject him to intensive precommunication analysis. But there is no way that this can be done for the diverse assortment of individuals who normally make up the audience of the mass media, the vehicles most commonly used in international propaganda.

What all this boils down to is that if our persuasive communication ends up with a net positive effect, we must attribute it to luck, not science. The propagandist cannot control the direction or the intensity of impact of his message, if, indeed, he reaches his target at all.

So much for the effectiveness of persuasive communication. Propaganda, as I said earlier, differs from other forms of persuasive communication in its source, its purpose, and its target. The purpose of propaganda may be to influence a government, but it is quite conceivable that the most effective and efficient way to accomplish this is to persuade a particular segment of the population whose composition is totally different from that of the individuals who make up the government. It is further possible that the propagandist is highly effective in his persuasive communication with this segment but that his effectiveness does not carry over to the ultimate objective of his propaganda—influencing the government. The effectiveness of propaganda may, therefore, be even less predictable and controllable than the effectiveness of mere persuasive communication.

Now, prediction and control are two key elements of effectiveness. Another element is an articulable objective. Measurement of effectiveness is, of course, impossible without a specifically stated objective, since we cannot say how well a person has succeeded unless we know what he is trying to do. Put another way, if you don't know where you are going, any road will take you there. Having an objective, the only way a person can successfully attain it is to have control of the vehicle that will take him to it. Finally, the only way he can control the vehicle is by being able to predict what will happen if he moves various knobs and levers in it.

NOTES

¹ A recent example was the feeler by the senior United States diplomat in the United Arab Republic, Donald C. Bergus, whose suggestions to President Sadat regarding a Suez Canal solution were termed his personal views by the State Department when they backfired. *The New York Times*, June 30, 1971

² Edward A. Suchman, *Evaluative Research: Principles and Practice in Public Service and Social Action Programs* (New York: Russell Sage Foundation, 1967), p. 86.

³ Some have spoken of non-purposive communication—for instance, the reflexive “communi-

cation" of bees described by von Frisch—but admit that this is not true communication. See D. O. Hebb and W. R. Thompson, "The Social Significance of Animal Studies," in Gardner Lindzey and Elliot Aaronson, eds., *The Handbook of Social Psychology*, vol. 2, 2d ed. (Reading, Mass.: Addison-Wesley, 1968), pp. 738–740.

⁴ Harold E. Burt, "An Experimental Study of Early Childhood Memory: Final Report," *Journal of Genetic Psychology*, 58 (1941), pp. 435–439.

⁵ I have discussed this problem with British, German, Egyptian, Indian, Polish, Czech, and French propaganda analysts, to name just a few, and found that they all faced the same dilemma we did in the United States. At the time, my analysis of the problem had not as yet crystallized in its present form.

⁶ Cf. Everett M. Rogers, *Diffusion of Innovations* (New York: Free Press, 1962), pp. 76–120; William J. McGuire, "Personality and Susceptibility to Social Influence," in E. F. Borgatta and W. W. Lambert, eds., *Handbook of Personality Theory and Research* (Chicago: Rand McNally, 1968), pp. 1130–1187.

⁷ Cf. Steven H. Chaffee, "Salience and Homeostasis in Communication Processes," *Journalism Quarterly*, 44 (Autumn, 1967), pp. 439–444, 453. Leon Festinger has suggested that "when opinions or attitudes are changed through the momentary impact of a persuasive communication, this change, all by itself, is inherently unstable and will disappear or remain isolated unless an environmental or behavioral change can be brought about to support and maintain it" ("Behavioral Support for Opinion Change," *Public Opinion Quarterly* 28 [Fall, 1964], p. 514). I disagree. Festinger's own dissonance theory, when viewed in conjunction with Fritz Heider's balance theory, points to the probability of collimation, which requires no change in the environment, only a reorientation toward it.

CHAPTER X

FOREIGN IDEOLOGY AND PROPAGANDA

What role does the ideology of a government play in its propaganda in international communications? What is the role of the form of government? Opinion is divided on these questions now, as in the past, although the trend of thinking of an increasing number of scientists since the late 1940s has been to emphasize national rather than ideological interests, to stress the similarities in the behavior of states over time rather than the differences.

Nevertheless, the form of government is an important consideration in some respects. For example, as an audience, a largely closed society presents major problems for the communicator. Penetration of the barriers can be made difficult, and the uniformity of ideas allowed open circulation by the government often limits the ambitiousness of the effort as well. However, the government often develops a credibility problem as a result of its communications control.

Neither is ideology's effect one-sided. Although an ideology may increase the personal commitment of its adherents and those whose conversion it seeks to complete, its economic, racial, religious, or other social ramifications may induce great fear in the majority, whose members usually cling to important cultural traditions in most societies, and may in the process alienate many leaders.

The essays in this chapter indicate, then, that the principles of communication are valid for all states, and that it is the audience and the objective that determine the theme and media used in a message, not the nature of the communicator's regime.

At the same time, a state identified with an all-embracing ideology may well choose to place many of its psychological initiatives in the framework of this ideology. Similarly, revolutionary regimes, which must present universalistic values as a *raison d'être*, often espouse equally intransigent positions in their propaganda. In neither case is the ideology determinative of the appeal: rather it is the interests of the communicator as he perceives them that take precedence.

It is stressed that the content of the illustrative material in this chapter should not be considered as having official Department of Defense approval, express or implied.

ROLE OF THE GOVERNMENT SYSTEM

Whether and to what extent political communications are effective may be influenced by the degree of control over the flow of the communications to and within the audience. It is clear that totalitarian regimes can exert a much greater control over communications channels, and hence over the information to which their citizens are exposed, than freer societies. On the other hand, individuals in closed societies tend to develop filters for regime communications and increasingly rely upon other means of receive-

ing information. Moreover, technological development and growth in the volume of communications recently have circumvented many of the controls that were formerly at the disposal of totalitarian regimes.

Democratic theory assumes public access to most information so that the public may reach decisions on matters of public concern after informed deliberation. Totalitarian government rests on almost complete control of information. From these antithetical positions it should not be assumed, however, that persuasive appeals should be eschewed by democratic governments domestically or internationally. Both models rely on domestic popular support—or at least tolerance—and both seek to justify their actions in communications to external audiences in order to obtain an international environment conducive to the realization of national objectives. Moreover, the two extreme points on the political spectrum serve to illustrate principles, not to portray governments actually in power which, inevitably, fall somewhere between the complete democratic model, on the one hand, and the totalitarian paradigm, on the other.

A survey of international communications shows that without exception each government explains its policies and practices to world audiences. Different techniques may be employed, different audiences appealed to, and different messages conveyed, but each regime, in its own style, attempts to sway attitudes in terms which may or may not employ ideology or other symbols to persuade.

PROPAGANDA AND THE MONOPOLY OF MASS COMMUNICATIONS*

BY CARL J. FRIEDRICH

and

ZBIGNIEW BRZEZINSKI

Central to the effective organization and operation of totalitarian government is the control of mass communication processes and output. Propaganda is woven into almost all aspects of life in totalitarian systems; it is not treated as merely one tool in isolation from others.

* * * * *

The nearly complete monopoly of mass communication is generally agreed to be one of the most striking characteristics of totalitarian dictatorship. It is also one of the features which clearly differentiates it from earlier forms of autocratic rule, as we have noted. Modern mass-communication media, the press, radio and television, and the film, have been developing gradually and have, under competitive conditions, been looked upon as an essential condition of large-scale democracy. For,

*Excerpts from "Propaganda and the Monopoly of Mass Communications," Chapter 11, *Totalitarian Dictatorship and Autocracy* by Frederick and Brzezinski, 2d ed. rev., Harvard University Press, Cambridge, Mass., 1965. without the possibility of communicating a great deal of information that is beyond the reach of the immediate community, even the casual participation in policy determination which the citizen of the modern state is called upon to perform would be impossible.

In totalitarian dictatorships, all these means of communication are centrally controlled by the government, regardless of whether they are also actually owned by the government, as in the Soviet Union, or continue under "private" ownership, as in fascist countries. Hence they are not available for the expression of criticism or even adverse comment. This monopoly of the channels of mass communication is reinforced by the control of the means of private communication, the postal services and more especially the telephone and telegraph. Wire tapping is a common practice, and there is of course no such thing as "privacy" of the mails. In the interest of combatting counterrevolutionary plots, the government claims the right to open all mail. What this means is that only word-of-mouth communication remains for those who wish to carry opposition beyond the point permitted by the government—surely a rather inefficient method under the conditions of modern mass society. All effective control over the content of communications is vested in the state, which in fact means the top party functionaries who usually possess, as a result of previous revolutionary agitation, considerable know-how in the field of propaganda.

Propaganda as such is not a peculiarity of totalitarian dictatorship. It has become increasingly recognized as an integral part of all organizational activity in a highly literate society.¹ Propaganda has been defined in different ways, depending in part upon what it was to be distinguished from. It should be pointed out here that the Soviets make a clear distinction between propaganda and agitation. Some of what we mean here by propaganda would, in Soviet terminology, more accurately be called agitation. To the Soviets, propaganda is restricted to a more refined, rational, documented appeal, designed to convince rather than to induce. Agitation tends to be more vehement, striking, and generally aimed at the masses.

It has been said that "propaganda is the other fellow's opinion." In line with such a superficial notion, many people think of propaganda as essentially untruth. But no propagandist worth his mettle will prefer an untruth to a truth, if the truth will do the job. This is the vital test of all propaganda activity: does it do the job? and what is the job? The needs, interests, and requirements of the organization for which the propagandist works determine the answer to this question. If it is the Red Cross, the "job" may be to secure contributions; if the *Ladies' Home Journal*, it may be subscriptions. The latter example shows that propaganda, under competitive conditions, resembles advertising; both are often soft-pedaled as "public relations." In short, propaganda is essentially action-related; it aims to get people to do or not to do certain things. That action focus may be either very visible or hidden away. But it always is there

and needs to be inquired into, if propaganda is to be understood. And since propaganda is carried on in behalf of an organization, it is equally important to inquire into who finances it. Many propagandists are reluctant, therefore, to reveal the source of their funds.²

In totalitarian dictatorships, virtually all propaganda is directed ultimately to the maintenance in power of the party controlling it. This does not mean, however, that there are not many sharp conflicts between rival propagandists. As will be shown later, the maintenance of totalitarian dictatorship does not preclude the occurrence of many internecine struggles; on the contrary, it lends to these struggles a fierceness and violence which is rarely seen in freer societies. This issue of the rival component elements in the totalitarian society poses very difficult problems for the over-all direction of propaganda. The chief propagandist often has to opt between such rival groups. (In the National Socialist Ministry of Propaganda and Public Enlightenment, these rival claims to some extent found expression in the organization of the "desk," that is to say, of different bureaus which would report on different sections of the society and would thus mirror the conflicts.)³

The documentary evidence that has become available since the war tends to support earlier views regarding the inner workings of Goebbels' propaganda organization.⁴ There is no need here to go into details of the organization, but some outstanding features deserve brief comment. Perhaps the most important aspect of this "monopoly" control was the dualism of government and party. Each had its elaborate propaganda setup, both headed by Goebbels, who succeeded in maintaining a measure of effective coordination. But on the whole it would seem that the Ministry of Propaganda and Public Enlightenment and the party office of propaganda were in a coordinate position. However, key officials of the ministry who stood in sharpest antagonism to Goebbels, like Otto Dietrich, the press chief of the Hitler government, also occupied pre-eminent posts in the party's propaganda machine. This "personal union" extended fairly far down the line. The relationship has been described as follows: "The task of the Propaganda Ministry in the whole machine for controlling and creating public opinion might be compared with a Ministry of War. It coordinates, plans, and is responsible for the smooth carrying out of the whole propaganda effort of the German government. The Party Propaganda Department, on the other hand, is comparable to the General Staff of an army which actually directs operations and musters and organizes the forces and their supplies and ammunition."⁵ It is seen from this and other evidence that the two organizations had different functions within the regime, comparable to the difference between party and government. The aggressive boldness of a leader of the National Socialist movement was as much a quality required of Goebbels as was the forceful caution of a leading government official. It is generally agreed that the most important instrument of Goebbels in planning and coordinating all the far-flung activities of his two organizations was the Coordination

Division of the ministry. Here was centered the conflict between the rival requirements of the two organizations; here, if possible, such difficulties were solved by the key officials of the division or, if necessary, by Goebbels himself. But it was never an easy task to draw together the various divergent strands of the propaganda apparatus, and the difficulties experienced by the Ministry of Propaganda reflected the tensions of the moment. It is an ever present problem when total monopoly control exists.

The same problem, often in aggravated form, confronts the totalitarian propagandist in the field of foreign relations. While he gains the advantage of controlling all channels of information to other countries, he suffers under the distinct disadvantage of having little chance to secure the confidence of people abroad, including the foreign governments themselves about any information reaching them. Hitler showed considerable awareness of these difficulties. At one time, talking among intimates, he noted that a sharp distinction must be made between handling the domestic and the foreign press. Radio messages for foreign countries must similarly be differentiated. Such messages, if intended for Britain, should contain musical offerings, since they would appeal to English taste and accustom the British public to tune in to German Broadcasts: "As regards news-bulletins to Britain, we should confine ourselves to plain statements of facts, without comment on their value or importance . . . As the old saying has it, little drops of water will gradually wear the stone away."⁶ Goebbels added that the opinion of people who have confidence in their leadership can be effectively swayed by pointed and unequivocal value judgments. He therefore recommended that, in messages to the German people, reference should be made again and again to "the drunkard Churchill" and to the "criminal Roosevelt."

This attempt to create stereotype images of the enemy has been developed to a fine point in Soviet propaganda. All discussions and pictorial representations of the enemy stress some specific feature suggesting the enemy's alleged criminal nature and evil intent. Operating on a huge scale and addressing its appeal to the great masses of the Soviet people, Soviet propaganda strives to present a simple, unrefined, and strikingly negative portrayal, so as to create the politically desirable conditioned reflex in those to whom it is directed. . . . It is to some extent in terms of these negative symbols that the "consensus" develops. As a matter of common observation, shared hostilities are an effective source of political association. Indeed, some political analysts have gone so far as to assert that political parties essentially rest on these shared animosities. The totalitarian dictatorships have built upon such negativist positions a good part of the popular loyalty to the regime.

During the war, Soviet anti-Nazi propaganda usually associated "Hitlerite" with such terms as "vermin" or "beast," frequently with corresponding illustrations. The anti-American campaign has similarly employed certain words over and over, such as war-mongering and im-

perialist, in speaking of American leadership. *Krokodil*, the humor magazine, has become a real rogues' gallery of various criminal types, with beast-like faces, dressed either in U.S. Army uniforms or in top hats and morning coats, their fingers dripping with blood and threateningly grasping an atomic bomb. In external propaganda, the Soviet Union never fails to draw a distinction between the people as such and the leaders, who are the ones who fit the stereotype.

The nearly complete control of all means of mass communication gives the totalitarian dictatorship the very great advantage of being able to shift its general line of propaganda rather radically over short periods of time. This is especially helpful in the field of foreign affairs. After the Hitler-Stalin Pact of 1939, Communist and Nazi propagandists were stressing all of a sudden the common features of these "popular" regimes and their contrast with the "Pluto-democracies" of the West. Various points were brought forward in this connection—such as that the Russians and Germans were both young and vigorous as contrasted with the decadence of the West. Even more striking is Russia's recent turn in regard to Communist China, as indeed has been the change in China itself. Such reversals in official propaganda lines are inconceivable under competitive conditions.

But while these shifts may work in the Soviet Union, they certainly tend to bring on a crisis in the Communist movement in other countries. Many Communist followers, including important men, have changed sides in the past and may do so again. After the Hitler-Stalin Pact, twenty-one French Communist deputies out of a total of seventy-two abandoned the party.⁷ Similarly, Nazi sympathizers in a number of countries, especially the United States, were deeply disturbed, and anti-Nazi activities were assisted by this change. Even deeper were the fissures caused by Khrushchev's denunciation of Stalin. In fact, the repercussions of that move are still audible in the way Communist parties have been affected by the conflict between the USSR and China.

But even internally the alteration in an official line may have subconscious reactions, which the leadership fails to appreciate. When Hitler suddenly decided to invade the Soviet Union in the summer of 1941, he was much pleased with his success in accomplishing this *salto mortale*. "I am proud that it was possible with these few men [himself, Goebbels, and a few aides] to shift course by 180 degrees. No other country could do the same."⁸ In this instance, we know from postwar documents that the effect on German public opinion was quite mixed. For, while some men who had previously stood aloof decided that in a life-and-death struggle with communism they must support Hitler, others concluded that, the game was up and joined what became a dangerous and large-scale opposition movement. Detached analysis suggests that it was not so much the propaganda as the very facts themselves which had the greatest effect.⁹

This instance serves to illustrate what is probably a very important aspect of all totalitarian propaganda. The fact of monopolistic control

gradually causes in the general public a profound distrust of all news and other kinds of information. Since people do not have any other sources of information, there develops a vast amount of rumor mongering as well as general disillusionment. And since a man cannot think without having valid information upon which to focus his thought, the general public tends to become indifferent. This in turn leads to a phenomenon we may call the "vacuum," which increasingly surrounds the leadership. Comparable problems have beset autocracies in the past. Well known is the tale of Harun al-Rashid, who stalked Baghdad at night disguised as a commoner to find out what was going on. Harun al-Rashid, so the tale goes, was wise enough to realize that his subordinates were prone to abuse their great power and, instead of employing it for the good of the community and the commonwealth, would oppress and exploit the people. He had no reliable way of ascertaining the common man's views through regular channels, since all of these were controlled by the very subordinates he wished to check up on, so the great Caliph disguised himself from time to time and mingled, in the dark of night, with the people in taverns and streets to listen to their tales of woe. On the basis of what he had heard, he would bring those to trial who had been talked about as vicious and corrupt. This problem of checking up occurs, of course, in all human organizations, but under orderly constitutional government (and the corresponding patterns of responsibility in private organizations), such checking occurs readily and continuously as a result of the open criticism that is voiced by members not only in formal meetings, but informally through press, radio, and all the other channels. Under the conditions of totalitarian dictatorship, the check-up becomes exceedingly difficult, if not impossible.

This failure to communicate effectively, both within the hierarchy and with the rest of the people and the world, we have called the "vacuum." There develops within the totalitarian regime a kind of empty space around the rulers, which becomes more and more difficult to penetrate. A slow disintegration affecting all human relations causes mutual distrust so that ordinary people are alienated from one another; all the bonds of confidence in social relationships are corroded by the terror and propaganda, the spying, and the denouncing and betraying, until the social fabric threatens to fall apart. The confidence which ordinarily binds the manager of a plant to his subordinates, the members of a university faculty to one another and to their students, lawyer to client, doctor to patient, and even parents to children as well as brothers to sisters is disrupted. The core of this process of disintegration is, it seems, the breakdown of the possibility of communication—the spread, that is, of the vacuum. Isolation and anxiety are the universal result. And the only answer the totalitarian dictatorship has for coping with this disintegration of human relationships is more organized coercion, more propaganda, more terror.

We know today that the SS of Himmler made extensive checkups on

the attitude of the German population during the war. Many of these reports show a remarkable candor about the faltering and eventually vanishing support for the regime.¹⁰ But there is every reason to believe that these reports never reached Hitler, even in abbreviated form. It is not even clear how many of them became available to Himmler. The terror that permeates the party and secret-police cadres, no less than the general population, operates as an inhibition to truthful reporting. Block wardens falsify their reports, in the hope of currying favor with their superiors. We shall see later how this tendency to pretend that results are better and more favorable to the regime than the facts warrant and to make adjustments, not only in reports about attitudes, but also in those about production and maintenance of industrial plant, interferes with industrial planning. . . .

A similar situation arose in Italy. We learn from Leto's *Memoirs* that only Rocchini among Mussolini's lieutenants had the courage to tell him that the Italian people were bitterly opposed to entering World War II; Starace even claimed that almost all Italians would unite behind the Duce. The Duce was similarly misinformed about the state of Italy's military preparedness; his subordinates preferred to flatter their chief by presenting rosy estimates, suggesting the prowess of his regime.¹¹

In the Soviet Union, the vacuum became most pronounced at the height of the Stalin terror. It has now become greatly reduced as a consequence of the policies of "popular totalitarianism." But even under the current regime, there is a good deal of it—as shown by the recurrent efforts of stimulating "letters to the editor." It also is operative in the world Communist movement and thereby affects the USSR's intelligence work in its foreign relations. It appears that Soviet intelligence is also handicapped by the fact that, in some respects at least, it must work with and through local Communist parties. If it tried to do without them, it would soon find itself in difficulties, particularly with reference to the problem of recruiting agents and contacts, as well as penetrating the government institutions of foreign powers.¹² But when the intelligence service employs the local party organization, it is exposed to the effect of this process of falsification, rooted both in fear of the Moscow center and in ideological blindness. Local Communist leaders, fearful of Moscow disfavor and subsequent purges, easily develop a tendency toward overestimating their strength and the degree of inner disintegration in the capitalist order. Soviet miscalculations in France and Italy are among many examples, dating back to the days of the Comintern and the unsuccessful Soviet venture in China. Also at the time of the blockade of Berlin, undertaken by the USSR in June 1948 to counteract the currency reform that the Allies had instituted after lengthy Soviet obstruction,¹³ it became clear that the Soviet Union, on the basis of East German information, had confidently counted upon the Germans in Berlin to abandon the Allied cause and submit to the Soviet position; even elementary intelligence work could have informed them to the contrary. In fact, there is reason to

believe that the entire Soviet policy in Germany was, to some extent, the result of such a failure of intelligence, because of excessive reliance upon German Communist information.

It would be a mistake, however, to conclude that the Soviet Intelligence agency, both at home and abroad, operates like a man wearing red-colored blinders. Soviet leadership makes special efforts to develop alternate channels of information and control in order to eliminate precisely this element of coloring and distortion. Soviet espionage, apart from collaborating with the local Communist parties, also operates independent networks, which report directly to Moscow. Espionage revelations show that there are normally at least five such networks in a country subjected to intensive Soviet espionage: one working through the local Communist party, another run by the MVD, a military intelligence network, a commercial espionage network, and finally the foreign-service intelligence network. Excessive discrepancies can thus be more easily detected when all such reports are processed in Moscow and submitted to the policymakers. Similarly, in their domestic surveillance, the Soviet rulers are careful not to make themselves dependent on only one source of information. Apart from the secret police and the ordinary channels of the party, there exist the party Control Commissions, which investigate party activities in all walks of life; the Ministry of State Control, which is specially concerned with keeping in touch with administrative functions and making independent reports on their operations; and the prosecutor general and his subordinates, who have . . . been given additional investigating powers. There is also the technique of *samokritika*, or self-critique, according to which Soviet officials and functionaries as well as the people in general are encouraged, besides examining themselves, to criticize the operations, but *not the policy*, of the party, the state administration, or the economic enterprises.* This not only serves as a vent to pent-up aggression, but is also useful to the rulers in detecting current weaknesses, abuses, and public attitudes. As a result of this, the Soviet regime can, when it wants to, judge the responsiveness of its population to its propaganda with a surprising degree of accuracy. Also, besides these sources, there are the press and the letters to the press and party headquarters, which have, at least for Smolensk, been analyzed thoroughly.¹⁴ . . . There is one major problem, however: as the totalitarian regime maintains its internal coercion and indoctrination, the degree of apparent consensus will in time increase, and the secret police will find it much more difficult to do its work. There is no doubt that the Soviet population is today much less divided in its opinions and reactions than it was a generation ago. This naturally makes information gathering less reliable. But it also makes it less urgent, since such consensus means that

*"Self-critique" is preferable to the more frequent translation of "self-criticism." There is a Russian word *krititsizm* which means criticism. *Kritika* means critique, and the Soviet regime is interested in promoting the technique of critique, but not in encouraging a critical attitude through criticism.

the regime's ideology has been "internalized". . . . And propaganda is thereby greatly facilitated.

Such consensus, such internalizing of the ideology, did not occur to any extent in Germany under Hitler (except within the party). Goebbels was by no means unaware of the difficulties he was confronting. In his diaries¹⁵ . . . the problem is a recurrent theme. They also show how well he knew how to exploit the clumsy views which were being aired by the Allies regarding the German people as a whole, particularly the demand for unconditional surrender. As the plain facts of the Allies' successful air war against Germany mounted, the unconditional-surrender formula remained as one of the few propaganda weapons to fall back upon. Another one was provided by the Morgenthau Plan put forward at Quebec in September 1943. But not only did the Allies provide desperately needed propaganda weapons; the Soviet Union, by repeatedly demanding that ten million Germans be furnished for reconstruction purposes in the Soviet Union, allowed Goebbels to note: "Demands like that are wonderful for our propaganda. They stir German public opinion deeply. The idea that our soldiers might not return home at all but might have to remain in the Soviet Union as forced labor is a terrible thought for every woman and every mother. The German people would prefer to fight to their last breath."¹⁶ Incidentally, this is an illustration of the fact noted above that a propagandist prefers a good fact to the best lie. But in spite of such aids, the task of propaganda became ever more desperate as the war continued. What evidently kept Goebbels going was that he himself believed, at least until the end of 1943, in the Fuhrer's ability to avert disaster.

That critical views printed in the press need not have any significant effect in a totalitarian regime, unless the leadership sees fit to take them into account, is demonstrated by Hitler. Great difficulties resulted from his hostility to the German press. This contrasted curiously with his avid interest in reading press reports from abroad.¹⁷ But although they were brought to him almost hourly, they failed to influence his modes of expression and his basic propaganda lines. Nor did he receive sound information about the probable course of British and American policy, nor about the trend of opinion in both countries. When he arrived at his decision to go to war with Poland, he did not seem to have expected the British to do much more than make a gesture of protest, and he hoped until the last to be able to keep the United States out of the war. The efforts of certain qualified persons, especially in the Foreign Office, to furnish Hitler with more adequate data were thwarted by the predominant party cadres.¹⁸ This circumstance shows the catastrophic effect of the factor we are here analyzing: an unintended consequence of totalitarian terror is an almost complete isolation of the leader. At the time Hitler decided to go to war, in the fateful August days of 1939, he isolated himself, and no advisers, not even Goering, let alone foreign diplomats—according to Sir Neville Henderson's pitiful account—could secure access to Hitler.¹⁹

Not the vacuum specifically, but the effect of it on the totalitarian ruler has caused one leading student of these problems to make the following comment:

Where the instruments of public enlightenment are wholly under the domination of the active elite of power, the controllers of the media develop a fantasy world in which the images communicated to the people have little relationship to reality. The stream of public communication becomes dogmatic and ceremonial to such a degree that it is inappropriate to think of communication management as a propaganda problem. It is more accurate to think of ritualization than propaganda.²⁰

Undoubtedly this kind of ritualization exists to some extent. On the other hand, repeated shifts in the actual lines of communication, involving the leadership in serious self-contradictions, suggest that large amounts of propaganda as such continue to be issued. The "fantasy world" in which the dictator lives, and which is a product of the vacuum that the terror has created around him, plays its role in competition with the real world that he seeks to master.

The lieutenants of a dictator are often more clearly aware of the complexity of the issues and the risks involved in a particular course of policy. It is interesting that a key German official believed that Hitler's unrealistic propaganda lines were decidedly detrimental to the regime. His comments indicate a typical clash of views between the professional propagandist and the ideologue, whether educator or party fanatic, who is preoccupied not with the survival but with the advance of the totalitarian movement. This man's comments are so revealing that they deserve quoting in full:

I was of the firm conviction at that time that a national socialist Germany could live in peace with the world, if Hitler had been restrained in his actions, had bribed the radicalism internally, and had externally an objective which took account of the interests of other nations. The provocative demonstrations, unnecessary in their extent. . . the anti-semitic excesses, the inciting and tolerating of violence, and the world propaganda of Goebbels as embodied in the tone and content of his Sportpalast demonstrations, were psychologically unsuited to gain support abroad for national socialist Germany and to cause other nations to recognize the good side of national socialism. These tactless and offensive outbursts decisively influenced world public opinion against Germany immediately after 1933.²¹

That the propaganda was unwise probably is right, but it overlooks the fact that Hitler was not primarily interested in the German people and was basically motivated by his totalitarian mission, as he conceived it; for this the German people were merely the tool.

As in nature, so in society, the vacuum is relative. And since totalitarian dictators, as already mentioned, to some extent at least realize their isolation, various efforts are made to reduce the "thin air" around them. We have shown some of the techniques employed for increasing the intake of popular reactions; totalitarian regimes have also developed techniques for increasing the outgo. Apart from the party members' continuing function as spreaders of propaganda lines, there has been developed the technique of whispering campaigns. A high party official will call in some of his friends a little further on down the line in the party and, in strict confidence, tell them something highly startling or secret.

He knows perfectly well that they will go and tell somebody else, in similarly strict confidence, and so on. This technique was and is employed also for the purpose of reaching and misleading foreign correspondents. The technique is, of course, not unknown in other societies; but in them it serves a purpose radically different from that in a totalitarian dictatorship. It is the means of penetrating a fog rather than reducing a vacuum.

The vacuum has another curious effect, as far as outgo is concerned. As already mentioned, people under totalitarian dictatorships become so suspicious of all communication, suspecting every news item of being propaganda, that even paramount facts are disbelieved. Thus it appears that, as late as September 12, 1938, the Germans professed not to know, or rather not to believe, that Britain and France had declared war upon Germany. To the blatant headlines of Goebbels' propaganda press, their reaction evidently was: "Another of Goebbels' propaganda stories." At the time of the Franco rebellion, when the papers reported, quite truthfully, that the British navy was demonstrating in the western Mediterranean, a widespread public reaction in Germany created a genuine war scare, because people were convinced that the British navy was threatening instead the North Sea coast of Germany.²² Goebbels in his diaries reports a number of other instances of this kind, and the entire collection provides a striking illustration for the vacuum theory; as the war went on, the problem of reaching the German populace became more and more perplexing.*

In the Soviet Union, the war also gave rise to many rumors, which swept the population by means of the OWS news agency—a translation of the popular and symptomatic abbreviation for the Russian phrase, "one woman said. . ." During the period of initial Soviet reverses, many exaggerated accounts of Soviet defeats, flights of leaders, and so forth were passed from mouth to mouth, contradicting the official radio broadcasts and newspaper communiques. Later on, by 1943 and 1944, as a corollary to the many promises of a happy future made during the war by the Soviet leaders, rumors circulated that the Soviet government had decided to end collectivization of agriculture and to release all political prisoners. Possibly such rumors were even originated purposely by the regime itself in order to gain public support for the war effort. In any case, some interviews with former Soviet citizens suggest that these rumors were widely believed, and the population was quite disappointed by the postwar harshness of the Stalinist policies. A similar instance is the extensive misrepresentation of figures on the grain harvest in the late fifties, which so gravely affected Khrushchev's agricultural efforts.

It would seem from all the evidence at our disposal that the vacuum

*Actually, this problem also plagued the people in charge of wartime propaganda in the Western democracies, for during the war "constitutional dictatorships" were instituted, and the controls over news resulting from this temporary concentration of power caused the public to become increasingly suspicious.

works like a cancer in the totalitarian systems. This means that its growth endangers the continued existence of the totalitarian scheme of things. It may even catapult such a dictatorship into a calamitous foreign adventure, such as Hitler's wars. Stalin's ignorance of the agricultural situation similarly made the food problem in the USSR very much more acute, according to Khrushchev's revelations. Reality is hard to perceive in a vacuum created by fear and lies, buttressed by force—hence the Khrushchevian policy of reducing the vacuum by greater popular participation.

An important feature of totalitarian propaganda is its all-pervasiveness, the direct result, of course, of the propaganda monopoly. Not only the members of the party and the more or less indifferent masses, but even the more or less determined enemies of the regime fall prey to its insistent clamor, to the endless repetition of the same phrases and the same allegations. A general pattern of thought, almost a style of thinking, proves increasingly irresistible as the regime continues in power. This is the basis of the consensus formation in the USSR. "It is clear," we read in one thorough study of these problems, "that there are people in all ranks of life who believe implicitly what they read and hear." Arguing from a presumably hostile sample, these analysts say that despite this "it is striking how the more implicit aspects of Soviet official communications, the mode of thought and the categories in which events are grouped, are reflected in the thought patterns and expression of our informants."²³

It has been, as a matter of fact, the frequent experience of interviewers of former Soviet citizens to find that even those who profess the most violent hostility to the Soviet system tend to think in patterns instilled into them by that regime. Their attitudes on such matters as freedom of the press or the party system are often inclined to mirror, even by contradiction or negation, official Soviet propaganda. Similarly, in such matters as word usage, words laden with propaganda-derived value judgments are used as part of their daily vocabulary. They thus serve unconsciously as unwitting propagandists for the regime they abhor.

This singular success of totalitarian propaganda is the result of constant repetition. Soviet press, radio, oral agitation, and propaganda operate ceaselessly, supplementing the party and Komsomol activities and the ideologically oriented training system.²⁴ Soviet newspapers, controlled centrally, repeat day after day the political themes set by *Pravda*, the organ of the party Central Committee, and *Izvestiya*, the central-government organ. *Pravda* itself, with a circulation of well over three million, is read and studied throughout the Soviet Union, particularly in the party cells, where it is compulsory reading. Local newspapers, many with circulations of several hundred thousand, such as *Pravda Ukrainy* and *Leningradskaya pravda*, re-echo the essential points of the Moscow daily, often reprinting its editorials and commentaries. The local press is also sometimes given special instructions about the handling of the news

and the sequence in which the various statements of the leaders are to be presented. For instance, after Malenkov's "resignation" in February 1955, Radio Moscow issued such special instructions to all the provincial papers. In addition to *Izvestiya* and *Pravda*, there are a large number of specialized papers for youth, the trade unions, the military, and others, published centrally and distributed throughout the USSR. All these newspapers, with a combined circulation of over forty-seven million in the 1950s, play an important role in the Soviet process of indoctrination.²⁵

This process is backed by the other two basic media of propaganda and indoctrination: the radio and personal agitation. The radio, with an estimated listening audience of about forty million, quite naturally devotes a great deal of its time to political matters.²⁶ A reliable estimate places the amount of time devoted to political and scientific broadcasts at 28 percent of the central program time. One of the most important Moscow radio broadcasts is the morning reading (7:00 a.m.) of the *Pravda* editorial, which is relayed simultaneously by all other Soviet stations.²⁷ Soviet radio publications openly admit the political importance of radio broadcasting, as seen in the following statement: "Radio helps considerably in the Communist education of the workers. It is one of the most important means of disseminating political information, of spreading the all-triumphant ideas of Marxism-Leninism, popularizing the most advanced industrial and agricultural techniques and the achievements of socialist culture, science, and art."²⁸ News and editorial programs particularly are designed to complement the press propaganda coverage and highlight the important points in the current propaganda themes. Foreign news is rarely given prompt treatment, and it is usually presented as a commentary. Furthermore, the use of radio-diffusion speakers, which work on the basis of wire transmission and are therefore useless for listening to non-Soviet stations, is promoted. This, of course, insures complete monopoly for Soviet broadcasting, and about 70 percent of all sets in the USSR are of this type.²⁹ Similar sets are now being introduced in the satellite regimes of Central Europe.

The third and, in some ways, the most important device is that of direct, personal agitation. This involves literally millions of agitators, some full-time, some part-time during special campaigns, who organize mass meetings, give lectures, visit families in their homes, distribute literature, set up study and discussion groups, and, in general, attempt to draw everyone into active participation in the indoctrination process. The estimated number of regular agitators is around two million, thus providing one agitator for every hundred Soviet citizens (including children).³⁰ In a sense, this mass indoctrination constitutes an effort to conduct a nationwide process of brainwashing, which only a very few succeed in completely avoiding. It is on these propaganda processes, as well as on the educational training system, that the regime depends for the achievement of total ideological integration of its people. It is these instruments of mental molding that are used by the administration to

produce a generation of convinced followers, thinking and acting in disciplined unison.

The technique of personal agitation has been elaborated by the leaders of Communist China. Based upon their experience during the long period of incubation when they were struggling to survive—a time they speak of as the “low ebb”—they have evolved, systematized, and tested what they call the democratic “mass line.” As early as 1934 Mao charged the party cadres with mobilizing the broad masses to take part in the revolutionary war.³¹ Although the situation has radically changed, since Mao and his party took over the government of all mainland China and established a totalitarian dictatorship, they have retained, adapted, and elaborated these techniques. “The mass line is the basic working method by which Communist cadres seek to initiate and promote a unified relationship between themselves and the Chinese population and thus to bring about the support and active participation of the people.” There is nothing particularly novel about the mass line; it is the propagation of the party line, applied under primitive technical and intellectual conditions, to millions of illiterate followers. To vulgarize and in the process distort and corrupt Marxist economic and social analysis was and remains no mean task. The detailed methods are in each case molded naturally by the folkways of the particular people. “This method includes the two techniques of ‘from the masses, to the masses,’ and ‘the linking of the general with the specific,’ the basic formulation [sic] given by Mao Tse-tung in ‘On Methods of Leadership’ (June 1, 1943),” writes the most penetrating student of Communist Chinese leadership methods.³²

Fascist propaganda techniques placed a similar emphasis upon the spoken word. Both Mussolini and Hitler were powerful orators who served as examples to many of their subleaders. Both also explicitly favored the technique; Hitler had supported this method emphatically in *Mein Kampf*, and it became a key policy of the Goebbels operation. One whole section of the party’s propaganda apparatus was dedicated to the training of speakers, and there was a deliberate effort made to cultivate oratory rather than written communications. Thousands of men were thus trained to emulate Hitler in developing the technique of rousing the mass assembly, with its emotional outbursts and its vague longings, to violent action against the Jew, the Marxist, and the November criminal.

All in all, the system of propaganda and mass communication developed in the totalitarian systems is of crucial importance for the maintenance of the regime. It may be doubted whether it could function so well without the terror, but it cannot be doubted that as it actually functions it is highly effective. If manipulative controls are carried beyond a certain point, the system becomes self-defeating. Hence the loosening up after Stalin’s death was intended to make the anti-Stalin propaganda effective. Now that there has developed a distinguishable “Soviet style of thinking,” there can be some easing of the controls. But “it would be unduly optimistic to assume that the Soviet leadership is to any major degree

moving toward the establishment of free discussion.”³³ The principles of thought control, as maintained by Lenin and other Communist leaders, are merely more flexibly applied. In a sense, such thought control dehumanizes the subjects of the regime by depriving them of a chance for independent thought and judgment.

THE CHANGING SOVIET UNION*

BY ITHIEL DE SOLA POOL

Monopoly of mass communications has been made more difficult as technological progress has improved and increased the channels of communication the sender and receiver may use.

"When Stalin ruled the Soviet Union only 2 percent of the Soviet people had the physical possibility of hearing foreign radio broadcasts. Today over a third of the people have that chance. That is a difference of monumental significance. . . .

"There never was a time when the Bolshevik attempt totally to control the information that reached Soviet citizens succeeded in full. There were always heroes who kept alive in the privacy of their heads, or within their families, political or national or religious faiths that the regime proscribed. There were also always islands of freedom in prison. Men to whom arrest and imprisonment had already happened, who had already written off rewards in this life, who knew that their neighbors also were enemies of the regime could sometimes talk more freely to each other than could people still trying to make their way up the treadmill. . . .

"There was also always in Stalin's Russia a rumor net that covered the country. Typically, each person in a totalitarian society, for sanity's sake, has to have one or two trusted friends in whom he can confide. Without that his thoughts will change; brainwashing will work. A completely unexpressed view does not survive. In Stalin's Russia . . . the net of personal confidence covered the country even though each person usually could talk freely to only one or two close friends. That is enough to permit very high saliency messages to diffuse rapidly throughout the country. . . .

"That kind of rumor net is, however, an inefficient kind of information channel. It carries only the dramatic item. It provides little richness of detail and little interpretive background. The best feature of rumor is that it may be accurate, contrary to common impressions. The evidence from various rumor studies suggests that rumors change little in the

*From "The Changing Soviet Union," *Current*, no. 67 (January 1966), pp. 12-17. Reprinted with the permission of *Current*, copyright holder, and the courtesy of the author.

course of transmission in the real world, and that what change takes place is in the direction of plausibility. If the truth is indeed implausible, that will result in message distortion; but since the truth is more often plausible, change in the message is often correction. Rumor . . . was and still is an important source, and on many topics the most reliable one, in Soviet society, but it is a grossly inadequate and thin source. In the absence of other and more detailed media, even persons very hostile to the regime and people who grossly distrust the official sources nonetheless become the captives of the totalitarian worldview because they do not have enough information to construct a valid picture of reality. . . .

"Recognition of this phenomenon by which total control of information captures the mind and shapes the worldview of even those who oppose the regime, was what led many free world writers in the latter years of the Stalin regime to fearfully anticipate a 1984 of brainwashed automated men. Orwell, Koestler, Milosz and many other writers expected the younger generations, wholly educated under totalitarian control, to yield to a value system and world view utterly at odds with Western civilization.

"Now in retrospect we see that they were too pessimistic. Soviet youth is unquiet. But too often we attribute the rebellious and liberal spirit sometimes found among Soviet youth simply to the psychology of adolescence and the inevitable conflict of generations. That is too simple. Such conflict can take many forms. It was not foreordained that Soviet youth would like beat jazz or that Soviet artists would paint abstractions. These are not the only forms that protest can take. The style of rebellion of the flappers and their companions in the 1920's was not the same as the style of today's adolescents. Rebellion against tradition in the intellectual milieu of the *philosophes* was not the same as that in Greenwich Village and Leningrad today.

"Why are the forms of rebellious individuality so similar in Russia and in the West today? Clearly not by coincidence, nor, I would argue, by any inevitable law of industrial society, but because of communication. There is now enough communication to keep us part of a single civilization, to keep us influencing each other, to assure that any Western idea circulates in the Soviet Union too. The pessimistic expectation that totalitarianism could develop an accepted heinous civilization of its own by 1984 or any other year has been defeated primarily by the forces of communication and above all, by international radio. . . .

THE IMPACT OF RADIO

"In 1940 there were about 1 million wave radio sets in the Soviet Union. By 1952 there were about 5.8 million. By now there are perhaps 35 million. If we simply assume that two-thirds of the sets could receive foreign short-wave broadcasts and that a set is available to all members of a family, then as a very rough approximation we can say that about one person in 57 could listen to a foreign broadcast if he dared to in 1940,

perhaps one in 13 in 1952, and one in 2.5 today. This is a highly significant change, for it changes drastically 1) the richness of foreign information available and, therefore, also changes 2) the role of rumor and 3) the role and reactions of the domestic media. . . .

"We have said that the accessibility of foreign broadcasts to something like one Russian in 2.5 (and that means to a large majority of urban, educated, white-collar Russians) increases the richness of foreign information available. Mere availability, however, would be of no interest if the available broadcasts were not used. After all, how many Americans listen to foreign broadcasts? *All the evidence, however, is that the Russian listener eagerly uses his short-wave bands.*"

Rumor is still important as a source of information about world affairs, "but in a very different way from what it was in Stalin's Russia. When one person in 57 had access to direct foreign news and maybe one in a couple of hundred heard any one item, its dissemination was largely conditioned by the filtering and sometimes distorting character of the oral net. In the present situation where one person in two or three has access to direct foreign news, in any small circle of friends or co-workers there will typically be several who have heard any major item [and] can diffuse, discuss, or correct it.

"Lest I be misunderstood let me emphasize that even a wide access situation does not overcome distortion and misunderstanding in the flow of information between countries or cultures. After all, the understanding by the American citizen of life in Russia is poor indeed, even though no censorship bars knowledge from him. But. . . he misunderstands because he has little motivation to learn about Soviet affairs, and to the extent that he does see Soviet affairs as relevant to him, it is in the narrow context of a threatening foe. Soviet facts are functional to him, therefore, insofar either as they fit the stereotype of evil or are reassuring about the intentions of limited capabilities of the potential foe. The American media reinforce these limitations on knowledge. . . .

"On the Soviet side, the development of worldwide media has in one respect made the situation similar to that in the West, though in other respects it is entirely different. The growth of access to foreign news sources with their rich picture of reality means that, as in the West, the only absolute barrier to full and accurate information is the psychological one. No longer do the devices of a police state successfully keep the Soviet citizen in the dark. What he learns or fails to learn is now primarily determined by the filters of what is functional to him.

"The lifting of jamming on almost all foreign broadcasts was the last step in making the major filter the citizen's interest. News was receivable with enough effort to evade the jamming before, so it was not a decisive barrier. But now it takes no significant effort by any radio owner who wants the world news to get it. For the Soviet citizen who craves information about the outside world international radio is but one, though the most important one, among a number of media that have been re-opening

the channels of contact with Western civilization. There are exhibits and dramatic performances and TV kinescopes . . . that are part of cultural exchange programs. Personal contact with visitors from abroad has also been increasing as well as travel abroad by Soviet citizens. The number of the latter to get abroad is in the hundreds of thousands (although an overwhelming majority travel to non-capitalist countries.) Travelers to the Soviet Union now run at about the same rate including a significant number of cultural, educational, scientific and marine personnel. . . .

Getting the News Sooner

"The printed word from abroad is also increasingly, but still sparsely, available. . . . [Yet] the motivated Soviet citizen can receive an increasing amount of international information from the Soviet media. These have had to respond to an increasingly competitive environment. In the Stalin era an unfavorable development abroad might be smothered in silence, and generally the Soviet media system waited a day or two until *Pravda* could first be told how to treat an unfortunate event, and then tell other media how to treat it. That is no longer possible. As officially stated in 1960, and reiterated in 1963: 'The central radio stations in Moscow must first of all assure timely broadcasts of important political information, effective commentary on domestic and foreign events, and the organization of various artistic programs. . . . Because radio should give the population the important news before the newspapers do, *Tass* has been instructed to transmit news immediately to central and local radio stations. Radio should communicate to the population all important news earlier than do the newspapers.'

"The Soviet radio has had to change drastically in response to its new foreign competition. It now has to report the world news as it occurs and not wait for a day. If it waits, it will be scooped by an interpretation other than the Soviet one. Silence encourages listening to foreign radio.

"For the same sort of reason the Soviets have started publishing magazines of reprints of foreign materials. There is *Inostrannaya Literatura* (*Foreign Literature*) and *Za Rubezhom* (*Abroad*). [The latter] is the great success story of the Soviet magazine world. This weekly, started in 1960, had reached a circulation of 400,000 by last September. In earlier years of paper shortages, rationed magazine subscriptions, and absence of foreign or domestic competition such a press for alien material would have been forbidden. But the Soviet Union today proudly claims that it can meet the demand for all magazines and that it now sells subscriptions to general magazines to all comers. *Za Rubezhom* has been allowed to meet the spontaneous and phenomenal demand. The interested Soviet common man can now read Walter Lippmann or the editorials from *Le Monde* in a legitimate and extensive, even if highly selected, Soviet source.

News for Elite Eyes Only

"For the Soviet elite there is, of course, as there always has been, substantial coverage of foreign news sources in the classified monitoring reports. These are of differing degrees of completeness according to the receiver's rank. Every day *Tass* sends virtually the entire nonlocal, political contents of *The New York Times* to the Soviet Union. Translations of whole Western books get produced in editions not for sale to the general public. Daily monitor reports can be read by authorized persons (besides those who get them personally) in numerous government offices and research institutes. The classified foreign news reports issued daily by *Tass* run to about 200 pages a day. . . .

"The change in access to foreign information that we have been describing is taking place in the context of a still wider though not deeper change in the Soviet communication system, namely, the growth of domestic mass media. Just as in a still broader economic context the Soviet Union is changing from an underdeveloped into an industrialized nation, so too its communication system is changing from a word of mouth system into a mass media system. . . .

Promoting Middle-Class Values

"We know too little about the psychological difference between living in a mass media system of communication and a pre-mass media system, but there are differences. Daniel Lerner has written about the role of the mass media in widening empathic capacity, i.e., enabling people to understand ways of life and roles that they have not experienced at first hand. Others have written of the role of the mass media in homogenizing society or in creating a mass society or in debasing culture. Actually, little of this speculation has much solid basis in research, but it does suggest some of the kinds of changes in the character of life that mass media bring in. They bring easy, passive, but obviously enjoyable, entertainment. They change patterns of social visiting, of friendships and of family life. They tend to encourage a value system and social structure that is more personal or familial, more pleasure oriented perhaps, certainly less group focused. They promote uniform middle-class values. In these respects a mass media system unifies society and dissolves some of the hold of special ethnic or class groups that make it up.

"Some of these changes can be seen in the Soviet Union. Russification, decay of folk culture, amalgamation of rural and urban ways of life, adoption of middle-class ways and modern values, increased orientation may have other causes too besides media growth, but the development of modern mass media reinforce such tendencies.

"The Soviet press writes about some of these and related trends in ways that sometimes sound much like the parallel discussions in this country. There are Soviet pedagogues, for example, who worry that TV watching is impinging on reading. One recalls the frequent post-Sputnik observation that the Russians are a nation of book readers. The taxi

driver with a classic in hand is a favorite idol of visiting journalists. It must be recognized that in part this book-reading habit simply reflected the aridity and also, to some degree, unavailability of mass media entertainment. Magazines, newspapers, radio and TV were scarce and what was available was ponderous, political and dull. They were dull to the point of driving the audience away. . . .

"Rejection of the dull Soviet mass media is still a characteristic citizen reaction but less so than ten years ago. Dullness and repetition in programming, is also a prime subject for Soviet discussions on radio and television. . . . The mass media revolution that is in process in Soviet society consists not only of the increased availability of magazine subscriptions, tape recorders, transistor sets, and TV, but also in a major effort to lighten their contents. . . .

THE MASS MEDIA AS PARTY RIVAL

"As such material becomes available and as effective mass media become a major means of coordinating social action and organizing life, one very subtle but important consequence has been the decline of the agitprop system. When Alex Inkeles wrote his classic book on *Public Opinion in the Soviet Union*, the most characteristic feature of the Soviet communication system was the use of oral agitators. Two million agitators, getting their guidelines from *Bloknot Agitatora*, bored the rest of their fellow countrymen at regular, sometimes daily, meetings at all sorts of places of work. None of that has now changed in any dramatic way, but a distinct erosion has set in. . . .

"The organizational network can, of course, still be mobilized at important moments. The last total mobilization was after Khrushchev's Twentieth Congress speech which was diffused not by publication but at meetings of party members all over the country. . . . It is true that the party machine with its secretary in every organization is the ruling machine. . . . But, just as in the West, political machines which still exist have been eroded in favor of direct use of the mass media by the top leaders to reach the public. . . .

"It is easy to oversimplify the picture of that trend. Let us not do so. Let us digress for a minute from the Soviet Union onto the general problem of the relation between mass media and face to face organization at various stages of development. Mass media and face to face communication are not completely substitutable commodities. Communications research in recent years has demonstrated that there are some things best done by the mass media and some things best done by word of mouth. They complement each other. The mass media are the cheapest way to diffuse knowledge rapidly, but personal influence is essential to get people to act. Any effective program of persuasion or leadership has to mesh mass media propaganda with some sort of organization. Effective marketing requires not only advertising but also a distribution network through stores and salesmen. . . .

"In general, modernization substitutes mass media influence for certain forms of traditional control and indoctrination within the family and other primary groups. While it loosens the grip of these primary institutions, however, it does not destroy them, and it also impels the growth, not the decline, of various forms of civic, commercial and social organizations.

"It is this complex, double-barrelled process that is taking place in the Soviet Union too. On the one hand, as the Soviet Union becomes a more complex industrial society the number and variety of organizations that it needs to create to carry out its myriad economic, social and scientific programs grow and grow. On the other hand, as the mass media become an increasingly important mobilizing, homogenizing and value-setting institution, many of the functions performed previously by the most primary and most personally controlling organizations, particularly the family and the local party organizations, are taken over by the media.

Competition at Home

"In a non-Communist society the most natural outcome of the mixed relationship in the process of development between the mass media and organization, is pluralism. A complex society which mobilizes itself partly by the essentially noncoercive but unindividualized means of mass media persuasion on the one hand, and partly by a myriad of specialized organizations on the other, tends most naturally to a pluralistic pattern of partial and overlapping loyalties and affiliations. This pattern is in sharp contrast to the kind of pre-modern society that socializes and controls each person within a single all-embracing primary group, be it a family, caste or clan, or be it a guild or party organization.

"In short, the Soviet conception or organization of society, via an encompassing structure of activities arranged at the place of work under the full direction of the local party organization was appropriate for mobilizing an underdeveloped country without an effective mass media system. It is an incubus in the complex society of today and is inevitably eroded to the degree that there are effective mass media. . . .

"No issue in Soviet life will be more important over the coming years than the struggle over the role of the party. The conservatives will continue to insist on effective control via party organization even at the inevitable cost of inefficiency and backwardness. The struggle will center to some degree on the role and character of the mass media, for, to the extent that the mass media are allowed to become lively and appealing, they must escape party control and indeed will tend to undermine party control. To the extent that the mass media are, on the contrary, held to the limited role of loudspeakers for party policies and resolutions, their potential for effectively mobilizing society are partially sacrificed. Without the debaters being fully aware of it, the debate over the mass media is also a debate over the party.

Competition from Abroad

"It is in the light of these issues about the domestic Soviet media that the importance of international media must be evaluated. Foreign radio and other foreign media have a profound influence on the course of Soviet development over and above their influence as direct sources of ideas. As competitors for the audience they force the Soviet media to become more candid, more lively, more varied. (In that respect, incidentally, foreign media succeed precisely as they lose their audience.) To the extent that these things happen the role of the party is changed and diminished."

What will happen to Soviet society as a result of the new influence of the mass media it is difficult to say. "Change is not necessarily gradual and continuous. All sorts of things may happen. Nonetheless, it does seem possible to predict that in the long run Russia will achieve a more modern type of society with a more normal form of social coordination that relies more heavily on freer mass media instead of party control and is generally more pluralistic."

PROPAGANDA AND DEMOCRACY*

BY JACQUES ELLUL

The success of psychological appeals is as important to democratic government as it is to other forms of government.

DEMOCRACY'S NEED OF PROPAGANDA

On one fact there can be no debate: the need of democracy, in its present situation, to "make propaganda."¹ We must understand, besides, that private propaganda, even more than governmental propaganda, is importantly linked to democracy. Historically, from the moment a democratic regime establishes itself, propaganda establishes itself alongside it under various forms. This is inevitable, as democracy depends on public opinion and competition between political parties. In order to come to power, parties make propaganda to gain voters.

Let us remember that the advent of the masses through the development of the democracies has provoked the use of propaganda, and that this is precisely one of the arguments of defense of the democratic State—that it appeals to the people, who are mobilized by propaganda; that it defends itself against private interests or anti-democratic parties. It is a remarkable fact worthy of attention that modern propaganda should have begun in the democratic States. During World War I we saw

*Excerpts from "The Socio-political Effects," Chapter V in *Propaganda: The Formation of Men's Attitudes*, translated from the French by Konrad Kellen and Jean Lerner, Alfred A. Knopf, New York, 1965, pp. 232-242. From PROPAGANDA: THE FORMATION OF MEN'S ATTITUDES, by Jacques Ellul. Copyright © 1968 by Alfred A. Knopf, Inc. Reprinted by permission of the publisher.

the combined use of the mass media for the first time; the application of publicity and advertising methods to political affairs, the search for the most effective psychological methods. But in those days German propaganda was mediocre: the French, English, and American democracies launched big propaganda. Similarly, the Leninist movement, undeniably democratic at the start, developed and perfected all propaganda methods. Contrary to some belief, the authoritarian regimes were not the first to resort to this type of action, though they eventually employed it beyond all limits. This statement should make us think about the relationship between democracy and propaganda.

For it is evident that a conflict exists between the principles of democracy—particularly its concept of the individual—and the processes of propaganda. The notion of rational man, capable of thinking and living according to reason, of controlling his passions and living according to scientific patterns, of choosing freely between good and evil—all this seems opposed to the secret influences the mobilizations of myths, the swift appeals to the irrational, so characteristic of propaganda.

But this development within the democratic framework can be understood clearly if we look at it not from the level of principles but from that of actual situations. If, so far, we have concluded that inside a democracy propaganda is normal and indispensable, even intrinsic in the regime, that there are one or more propagandas at work, nothing seems to make propaganda obligatory in *external* relations. There the situation is entirely different. There the democratic State will want to present itself as the carrier of its entire public opinion, and the democratic nation will want to present itself as a coherent whole. But that creates some difficulty because such desire does not correspond to a true and exact picture of democracy. Moreover, this implies an endemic, permanent state of war. But, whereas it is easy to show that permanent wars establish themselves at the same time as democratic regimes, it is even easier to demonstrate that these regimes express a strong desire for peace and do not systematically prepare for war. By this I mean that the economic and sociological conditions of the democracies possibly provoke general conflicts, but that the regime, such as it is, is not organically tied to war. It is led there, *volens nolens*. And it adjusts poorly to the situation of the Cold War, which is essentially psychological.

Another circumstance imprisons democracy in the ways of propaganda: the persistence of some traits of the democratic ideology. The conviction of the invincible force of truth is tied to the notion of progress and is a part of this ideology. Democracies have been fed on the notion that truth may be hidden for a while but will triumph in the end, that truth in itself carries an explosive force, a power of fermentation that will necessarily lead to the end of lies and the shining apparition of the true. This truth was the implicit core of the democratic doctrine.

One must stress, furthermore, that this was in itself a truth of an ideological kind that ended by making history because it imposed itself on

history. This attitude contained the seeds of, but was at the same time (and still is) the exact opposite of, the current Marxist attitude that history is truth. Proof through history is nowadays regarded as *the* proof. He in whose favor history decides, was right. But what is "to be right" when one speaks of history? It is to win, to survive, *i.e.*, to be the strongest. This would mean that the strongest and most efficient, nowadays, is the possessor of the truth. Truth thus has no content of its own, but exists only as history produces it; truth receives reality through history.

One can easily see the relationship between the two attitudes and how one can pass easily from one to the other: for if truth possesses an invincible power that makes it triumph through itself alone, it becomes logical—by a simple but dangerous step—that triumph is truth. But—and this is frightening—the consequences of the two attitudes are radically different.

To think that democracy must triumph because it is the truth leads man to be democratic and to believe that when the democratic regime is opposed to regimes of oppression, its superiority will be clear at first sight to the infallible judgment of man and history. The choice is thus certain. What amazement is displayed again and again by democrats, particularly Anglo-Saxon democrats, when they see that a man selects something else, and that history is indecisive. In such cases they decide to use information. "Because democratic reality was not known, people have made a bad choice," they say, and even there we find the same conviction of the power of truth. But it is not borne out by facts. We will not establish a general law here, to be sure, but we will say that it is not a general law that truth triumphs automatically, though it may in certain periods of history or with respect to certain verities. We cannot generalize here at all. History shows that plain truth can be so thoroughly snuffed out that it disappears, and that in certain periods the lie is all-powerful.

Even when truth triumphs, does it triumph through itself (because it is truth)? After all, the eternal verities defended by Antigone would, in the eyes of history, have yielded to Creon even if Sophocles had not existed.

But in our time, the conviction of democracy and its claim to inform people collide with the fact that propaganda follows an entirely different mechanism, performs a function entirely different from that of information, and that nowadays facts do not assume reality in the people's eyes unless they are established by propaganda. Propaganda, in fact, creates truth in the sense that it creates in men subject to propaganda all the signs and indications of true believers.

For modern man, propaganda is really creating truth. This means that truth is powerless without propaganda. And in view of the challenge the democracies face, it is of supreme importance that they abandon their confidence in truth as such and assimilate themselves to the methods of propaganda. Unless they do so, considering the present tendencies of

civilization, the democratic nations will lose the war conducted in this area.

DEMOCRATIC PROPAGANDA

Convinced of the necessity for using the means of propaganda, students of that question have found themselves facing the following problem. Totalitarian States have used propaganda to the limit, domestically in order to create conformity, manipulate public opinion, and adjust it to the decisions of the government; externally to conduct the Cold War, undermine the public opinion of nations considered enemies, and turn them into willing victims. But if these instruments were used principally by authoritarian States, and if democracies, whose structure seemed made for their use, did not use them, can they now be used by democracies? By that I mean that the propaganda of the authoritarian State has certain special traits, which seem inseparable from that State. Must democratic propaganda have other traits? Is it possible to make democratic propaganda?

Let us quickly dismiss the idea that a simple difference of content would mean a difference in character. "From the moment that propaganda is used to promulgate democratic ideas, it is good; if it is bad it is only because of its authoritarian content." Such a position is terribly idealistic and neglects the principal condition of the modern world: the primacy of means over ends. But one may say—and this is a matter worthy of reflection—that democracy itself is not a good "propaganda object." Practically all propaganda efforts to promulgate democracy have failed. In fact, one would have to modify the entire concept of democracy considerably to make it a good propaganda object, which at present it is not.

Also, in passing, I will mention the following thought: "From the moment that democracy uses this instrument (propaganda), propaganda becomes democratic." This thought is not often expressed quite so simply and aggressively, but it is an implicit notion found in most American writers. Nothing can touch democracy: on the contrary, it impresses its character on everything it touches. This prejudice is important for understanding the American democratic mythology and the tentative adoption of this principle by other popular democracies.

Such positions are so superficial and so remote from the actual situation that they do not need to be discussed. Besides, they usually come from journalists or commentators, and not from men who have seriously studied the problem of propaganda and its effects. Even the majority of the latter, however, retain the conviction that one *can* set up a propaganda system that expresses the democratic character and does *not* alter the working of democracy. That is the double demand that one must make of propaganda in a democratic regime.

It is argued that the first condition would be met by the absence of a monopoly (in a democracy) of the means of propaganda, and by the free

interplay of various propagandas. True, compared with the State monopoly and the unity of propaganda in totalitarian States, one finds a great diversity of press and radio in democratic countries. But this fact must not be stressed too much: although there is no State or legal monopoly, there is, nevertheless, indeed a private monopoly. Even where there are many newspaper publishers, concentration as a result of "newspaper chains" is well established, and the monopolization of news agencies of distribution and so on, is well known. In the field of radio or motion pictures the same situation prevails: obviously not everybody can own propaganda media. In the United States, most radio and motion picture corporations are very large. The others are secondary and unable to compete, and centralization still goes on. The trend everywhere is in the direction of a very few, very powerful companies controlling all the propaganda media. Are they still private? In any event, as we have already seen, the State must make *its* propaganda, if only under the aspect of disseminating news.

Assuming that information is an indispensable element of democracy, it is necessary that the information promulgated by the State be credible. Without credibility, it will fail. But what happens when a powerful private propaganda organization denies facts and falsifies information? Who can tell where truth lies? On whom can the citizen rely to judge the debate? It is on this level that the dialogue really takes place. The problem then is whether the State will support a private competitor who controls media equal or superior to its own but makes different propaganda. It may even be entirely legitimate for the State to suppress or annex such a competitor.

Some will say: "Freedom of expression is democracy; to prevent propaganda is to violate democracy." Certainly, but it must be remembered that the freedom of expression of one or two powerful companies that do not express the thoughts of the individual or small groups, but of capitalist interests or an entire public, does not exactly correspond to what was called freedom of expression a century ago. One must remember, further, that the freedom of expression of one who makes a speech to a limited audience is not the same as that of the speaker who has all the radio sets in the country at his disposal, all the more as the science of propaganda gives to these instruments a shock effect that the non-initiated cannot equal.

I refer in this connection to the excellent study by Rivero,² who demonstrates the immense difference between the nineteenth and twentieth centuries in this respect:

In the nineteenth century, the problem of opinion formation through the expression of thought was essentially a problem of contacts between the State and the individual, and a problem of *acquisition of a freedom*. But today, thanks to the mass media, the individual finds himself outside the battle . . . the debate is between the State and powerful groups. . . . Freedom to express ideas is no longer at stake in this debate. . . . What we have is mastery and domination by the State or by some powerful groups over the whole of the technical media of opinion formation . . . the individual has no access to them . . . he is no longer a particip-

ant in this battle for the free expression of ideas: he is the stake. What matters for him is which voice he will be permitted to hear and which words will have the power to obsess him. . . .

It is in the light of this perfect analysis that one must ask oneself what freedom of expression still means in a democracy.

But even if the State held all the instruments of propaganda (and this becomes increasingly probable for political, economic, and financial reasons—particularly so far as TV³ is concerned), what characterizes democracy is that it permits the expression of different propagandas. This is true. But it is impossible to permit the expression of all opinion. Immoral and aberrant opinions are justifiably subject to censorship. Purely personal opinions and, even more, certain political tendencies are necessarily excluded. “No freedom for the enemies of freedom” is the watchword then. Thus the democracies create for themselves a problem of limitation and degree. Who then will exclude certain propaganda instruments? For the Fascist, the Communists are the enemies of truth. For the Communists, the enemies of freedom are the bourgeois, the Fascists, the cosmopolitans. And for the democrats? Obviously all enemies of democracy.

Matters are even more serious. In time of war, everybody agrees that news must be limited and controlled, and that all propaganda not in the national interest must be prohibited. From that fact grows a unified propaganda. The problem that now arises is this: We have talked of the Cold War. But it seems that the democracies have not yet learned that the Cold War is no longer an exceptional state, a state analogous to hot war (which is transitory), but is becoming a permanent and endemic state.

There are many reasons for that. I will name only one: propaganda itself.

Propaganda directed to territories outside one's borders is a weapon of war. This does not depend on the will of those who use it or on a doctrine, but is a result of the medium itself. Propaganda has such an ability to effect psychological transformations and such an impact on the very core of man that it inevitably has military force when used by a government and directed to the outside. There is no “simple” use of propaganda; a propaganda conflict is hardly less serious than an armed conflict. It is inevitable, therefore, that in cold war the same attitude exists as in the case of hot war: one feels the need to unify propaganda. Here democracies are caught in a vicious circle from which they seem unable to escape.

The other principal aspect of democratic propaganda is that it is subject to certain values. It is not unfettered but fettered;⁴ it is an instrument not of passion but of reason.⁵ Therefore, democratic propaganda must be essentially truthful. It must speak only the truth and base itself only on facts. This can be observed in American propaganda: it is undeniable that American information and propaganda are truthful. But that does not seem to me characteristic of democracy. The formula with which Ameri-

cans explain their attitude is: "The truth pays." That is, propaganda based on truth is more effective than any other. Besides, Hitler's famous statement on the lie is not a typical trait of propaganda. There is an unmistakable evolution here: lies and falsifications are used less and less. We have already said that. The use of precise facts is becoming increasingly common.

Conversely, the use of nuances and a certain suppleness reveals an attitude peculiar to democracy. At bottom there is a certain respect for the human being, unconscious perhaps, and becoming steadily weaker, but nevertheless still there; even the most Machiavellian of democrats respects the conscience of his listener and does not treat him with haste or contempt. The tradition of respecting the individual has not yet been eliminated, and this leads to all sorts of consequences. First, it limits propaganda. The democratic State uses propaganda only if driven by circumstances—for example, traditionally, after wars. But whereas private and domestic propaganda is persistent in its effects, governmental and external propaganda evaporate easily. Besides, such propaganda is not total, does not seek to envelop all of human life, to control every form of behavior, to attach itself ultimately to one's person. A third trait of democratic propaganda is that it looks at both sides of the coin. The democratic attitude is frequently close to that of a university: there is no absolute truth, and it is acknowledged that the opponent has some good faith, some justice, some reason on his side. It is a question of nuances. There is no strict rule—except in time of war—about Good on one side and Bad on the other.

Finally, the democratic propagandist or democratic State will often have a bad conscience about using propaganda. The old democratic conscience still gets in the way and burdens him; he has the vague feeling that he is engaged in something illegitimate. Thus, for the propagandist in a democracy to throw himself fully into his task it is necessary that he believe—*i.e.*, that he formulate his own convictions when he makes propaganda.

Lasswell has named still another difference between democratic and totalitarian propaganda, pertaining to the technique of propaganda itself, and distinguishing between "contrasted incitement" and "positive incitement." The first consists of a stimulus unleashed by the experimenter or the authorities in order to produce in the masses an effect in which those in power do not participate. This, according to Lasswell, is the customary method of despotism. Conversely, the positive incitement, symbolizing the extended brotherly hand, is a stimulus that springs from what the powers that be really feel, in which they want to make the masses participate. It is a communal action. This analysis is roughly accurate.

All this represents the situation in which democracies find themselves in the face of propaganda, and indicates the differences between democratic and authoritarian propaganda methods. But I must now render a very serious judgment on such activity (democratic propaganda): all that

I have described adds up to ineffectual propaganda. Precisely to the extent that the propagandist retains his respect for the individual, he denies himself the very penetration that is the ultimate aim of all propaganda: that of provoking action without prior thought. By respecting nuances, he neglects the major law of propaganda: every assertion must be trenchant and total. To the extent that he remains partial, he fails to use the mystique. But that mystique is indispensable for well-made propaganda. To the extent that a democratic propagandist has a bad conscience, he cannot do good work; nor can he when he believes in his own propaganda. As concerns Lasswell's distinction, the technique of propaganda demands one form or the other, depending on circumstances. In any event, propaganda always creates a schism between the government and the mass, that same schism I have described in the book *The Technological Society*, and that is provoked by all the techniques, whose practitioners constitute a sort of aristocracy of technicians and who modify the structures of the State.

According to Lasswell's analysis, propaganda based on contrasted incitation expresses a despotism. I would rather say that it expresses an aristocracy. But the famous "massive democracy" corresponds to that, *is* that. Ultimately, even if one tries to maintain confidence and communion between the government and the governed, all propaganda ends up as a means by which the prevailing powers manipulate the masses.

The true propagandist must be as cold, lucid, and rigorous as a surgeon. There are subjects and objects. A propagandist who believes in what he says and lets himself become a victim of his own game will have the same weakness as a surgeon who operates on a loved one or a judge who presides at a trial of a member of his own family. To use the instrument of propaganda nowadays, one must have a scientific approach—the lack of which was the weakness that became apparent in Nazi propaganda in its last few years: clearly, after 1943, one could see from its content that Goebbels had begun to believe it himself.

Thus, some of democracy's fundamental aspects paralyze the conduct of propaganda. There is, therefore, no "democratic" propaganda. Propaganda made by the democracies is ineffective, paralyzed, mediocre. We can say the same when there is a diversity of propagandas: when various propagandas are permitted to express themselves they become ineffective with respect to their immediate objective. This ineffectiveness with regard to the citizens of a democracy needs more analysis. Let us merely emphasize here that our propaganda is outclassed by that of totalitarian States. This means that ours does not do its job. But in view of the challenge we face, it is imperative that ours be effective. One must therefore abandon the traits that are characteristic of democracy but paralyzing for propaganda: the combination of effective propaganda and respect for the individual seems impossible.

There is a last element, which I shall mention briefly. Jacques Drien-court has demonstrated that propaganda is totalitarian in its essence, not

because it is the handmaiden of the totalitarian State, but because it has a tendency to absorb everything. This finding is the best part of his work.⁶ It means that when one takes that route, one cannot stop halfway: one must use all instruments and all methods that make propaganda effective. One must expect—and developments over the past dozen years show it—that the democracies will abandon their precautions and their nuances and throw themselves wholeheartedly into effective propaganda action. But such action will no longer have a special democratic character.

...[To measure the effects that the making of propaganda has on democracy], we must distinguish between external and domestic propaganda. We must not retain the illusion that propaganda is merely a neutral instrument that one can use without being affected. It is comparable to radium, and what happens to the radiologists is well known.

* * * * *

NOTES

¹ Perceptive authors agree that without propaganda a democratic State is disarmed at home (vis-à-vis the parties) and abroad, the latter as a result of the famous "challenge" that sets the democracies and the totalitarian States against each other. But one must not overlook the many setbacks that democracy has suffered for lack of propaganda. Maurice Megret shows (in *L'Action psychologique* [Paris: A. Fayard; 1959]) that the crisis in which the French Army found itself from 1950 on was in large part caused by an absence of psychological action on the part of the government, and he demonstrates that the famous Plan was less than a great success for the same reasons. Finally, we must remember that if the democratic State is denied the right to make propaganda, such propaganda appears in the form of Public Relations at the expense of the State, and is all the more dangerous because camouflaged.

² "Technique de formation de l'opinion publique," in *L'Opinion Publique* (1957).

³ In France. (Trans.)

⁴ Propaganda as such is limited in the democracies by law, by the separation of powers, and so on.

⁵ See, for example, "Trends in Twentieth-Century Propaganda," by Ernst Kris and Nathan Leites, who contrast the appeal to the super-ego and to the irrational by authoritarian propaganda with democratic propaganda, which is directed at the ego.

IDEOLOGY

In a real sense, all international persuasive communication implies an ideology. Within this general concept, however, differences in ideological content are vast and highly significant. The inherent applicability of any specific ideology to psychological operations is often lessened as the meaning of the ideology is explicated in detail. This is because such specification forces an ideology to define itself in terms of concrete choices, choices which will alienate some even as they will attract others. The individual aspects of a broad philosophy can appeal however to different audiences, and the prudent, ideologically motivated communicator will be aware of the aspects he must emphasize and de-emphasize to appeal to different audiences.

A second major weakness of ideologically based appeals is, as Bernard

Yoh points out, that another government or group may choose to emphasize the contradictions between the communicator's ideology and the traditions and values of the audience.

Against such weaknesses must be weighed the ability of universalistic ideologies to produce "true believers." An all-encompassing ideology is an entire value system with its own justification and ethical code which some converts may find appealing, and in support of which they may become jealous or even fanatical.

COMMUNIST IDEOLOGY AND REVOLUTION*

BY JOHN H. NORTON

Selected elements of Marxian theory lend themselves unusually well to either totalitarian regimes' justification or stimuli for revolution.

* * * * *

An ideology is a philosophical construction which explains everything about the historical process by logical deduction from a single basic idea. Unlike other philosophies an ideology usually claims a monopoly of truth and is intolerant of other outlooks. In these aspects it bears a resemblance to religion, with which it is often compared. Unlike revealed religions, however, ideologies claim to be based upon scientific truth, since they deal with natural and not supernatural processes and since they are internally consistent. In this assertion, however, they err by ignoring the basis of scientific truth, which is composed of tentative (heuristic) propositions to be tested independently by many individuals against observable reality and discarded if they do not meet that empirical test. Despite the fact that they demand acceptance in the name of science, ideologies are dogmas which display very little curiosity about the real world. But in this respect they are less secure and more subject to change than religions. They purport to explain natural events, and they are therefore open to challenge when they fail to predict them.

Ideologies play an important role in social change. They seem to arise from the psychological stresses produced when a social system is not in equilibrium, and they serve the individual who accepts them as a means for relieving these tensions. In this respect they offer a consistent picture of the universe which gives meaning to the life of the individual and offers an explanation of the events he witnesses. Often they serve as replacements for old value systems which have broken down under social change, and they serve as a rallying point for those individuals who are dissatisfied with the social system.¹

Because of their religious and pseudoscientific nature, ideologies can be used to influence and organize people. Those who use them for this

*Excerpts from "Russia, China, and Insurgency," *Naval War College Review*, XXIII, no. 2 (October 1970), pp. 60-68. Reprinted with the approval of the Editor, *Naval War College Review*, and the author.

purpose are not necessarily cynical or sinister manipulators; it is more likely that they have accepted the ideology too.² Particularly for those at the center of a revolutionary movement, the psychological satisfaction of directing that movement toward a meaningful ideological goal can be tremendous.³ So, aside from the intrinsic appeal of the ideology itself, there are powerful psychological and social rewards for those who subscribe to it.

Marxism and its offshoots are just such ideologies.

Marx proposed a theory of history and economics which, with modification, is still widely accepted. He saw history as a process in which people's thoughts, attitudes, and actions are largely determined by economic factors. These factors were held responsible for the division of people into classes and for the struggle between those classes which would—after passing through periods of feudalism and capitalism—finally and inevitably result in a revolution of those who produced wealth (the workers), which in turn would bring about a utopian classless society.

Marx's view of this society was optimistic and idealistic. He foresaw it as a society in which . . .

men would exercise a much greater, and equal, control over their individual destinies; would be liberated from the tyranny of their own creations such as the State and bureaucracy, capital and technology; would be productive rather than acquisitive; would find pleasure and support in their social cooperation with other men, rather than antagonism and bitterness in the competition with them.⁴

This utopian vision still has much appeal today. It represents enough universal human longing to attract the radical students in the industrialized countries as well as the peasant societies of the Third World.

Four points in Marx's theories are particularly important. First is his argument that misery and want are not *natural* conditions, but *political* ones—the results of social institutions and not of scarcity. In this, his philosophy continues in a direct line from that of the French Revolution, whose leaders saw human happiness and the alleviation of poverty as the ends of revolution. (Note the significant contrast of this idea to that of the American Revolution, which was fought to free individuals to seek their own happiness within a political order based on their own consent. This is an important practical and philosophical difference.⁵)

Second is Marx's emphasis on historical determinism. Despite his concern with human happiness, human beings are seen not as individuals with individual needs and capabilities, but as agents of an historical process over which they can have little control. The corollary of this notion is purely ideological—that humans can best find happiness now by joining, not resisting, the inevitable movement toward socialism and the victory of the working class.

Third, we have Marx's conception of the dialectic of the historical process, which meant that out of the conflict of thesis (the old society) and antithesis (reaction to its injustices) would emerge a new synthesis (the

new order). A corollary of this idea was that reforms of the old order only slowed the historical process and the ultimate revolution and were therefore undesirable. In short, "real" change could only be brought about by revolution.

Finally, we come to Marx's idea of the alienation (estrangement, dehumanization) of man in industrial (capitalist) society, by which he meant that the division of labor and the necessity for bureaucratic administration created by the advance of technology had resulted in a condition wherein man received no self-fulfillment from his work and life. It is this concept, seized upon by Marcuse and other contemporary social critics, which has crystallized opposition to unthinking commercialism and bureaucratic government by the student left in the industrialized countries.

The problems with Marx's original theories are well known. The labor theory of value, upon which he based much of his argument, was later shown to be deficient. His touching confidence that human nature would change from acquisitiveness to cooperation with the imposition of different social institutions was ill founded. He failed to see that his scheme provided no safeguards against the conversion of the dictatorship of the proletariat into the tyranny of a party; his classless society allows for no other institutions which could compete with the state or offer that society some defense against the totalitarianism of the new elite.

Nevertheless, the elements of Marx's theory mentioned above make it unusually susceptible to perversion into dogma for ideological purposes, either as the charismatic justification of a totalitarian system or as a stimulus to revolution. The theory tells men that they can achieve happiness by changing certain political institutions held to be responsible for their misery. It tells them that they will be acting against history if they do not change these institutions in a certain way (revolution). It explains their present discontent, and it gives them a sense of participation in history if they adhere to the theory. In short, it claims a monopoly of truth, supports all those who believe in it, and provides a justification for ignoring or eliminating those who disagree. Marx was clever enough to have been able to recognize these problems, had he lived into the 20th century. An enemy of classes and bureaucracy, he would very likely be appalled by the Communist states today. Even at the end of his life he wrote to his son, "I am not myself a Marxist."

It was left for Lenin to covert these theories into ideology. . . . He made two important contributions. He extended the theory of revolution to include not only the proletariat, but the large mass of peasants as well. And he forged the priesthood of the Communist Party as the conspiratorial vehicle for revolution and the guardian of the dogmatic faith of Marxism.

Mao Tse-Tung's addition to Marxist ideology arose out of his well-known experiences in mobilizing a peasant base to struggle against the Nationalist Government and the Japanese. In the course of this struggle

he continued to move away from reliance on the proletariat and toward reliance on the peasants as the backbone of communism. He thus incorporated into the body of Marxist doctrine the peasant who had been despised by Marx and his European followers and who had been utilized but largely overlooked by Lenin.

The success of Mao's organizational efforts and guerrilla tactics in China moved him to elevate the new emphasis into dogma and extend it to international politics, where he now postulates a worldwide "guerrilla war" of the underdeveloped, rural Third World against the metropolitan powers of Europe and North America.⁶ This element in Mao's ideology has been both the instrument and the motivation for China's mischief making in the Third World and, of course, contributed also to the break with Russia.

What then is the role of contemporary Marxist ideology in the unstable social and political situation existing in the developing countries? How much is it responsible for the unrest there? What appeal does it have to individuals in those societies and why? To what degree is it merely a tool of Soviet and Chinese interests?

... The Soviets and China have promoted revolution and the spread of Marxist ideology in the underdeveloped countries for their own political purposes. But to believe that the influence of communism in these areas is solely, or even chiefly, the result of conspiratorial, outside Communist "takeover" tactics is to ignore the inherent relevance of this ideology to the Third World and to render ourselves incapable of dealing with the complex situation in the Third World except in the emotional and somewhat simplistic manner in which we have reacted in Vietnam and the Dominican Republic.

Do we really think that modern Communist ideology could have taken such deep root in Asia and Latin America if it did not have some meaning to the people there? The Third World is not Eastern Europe, where communism was imposed on an unwilling population by Stalin's armies. It stretches the imagination to believe that the hundreds of thousands of highly motivated Vietcong can be but dupes of clever organizers and propagandists.

Marxist ideology and Communist organization are, and will continue to be, successful in the underdeveloped countries for at least five reasons:

- (1) Marxist utopianism fits right in with the natural utopianism which exists in all peasant societies.
- (2) Communist organization offers a quick, practical means for native intellectuals to gain a pervasive control of their societies.
- (3) Communist governments are effective in creating political controls capable of holding a society together in today's world.
- (4) The hostility of Communist doctrine to Western Europe and the United States provides a rationale for developing countries to cast off odious colonial influence and inappropriate Western-style political systems.

(5) Both the ideology and the hierarchical social organization of modern communism offer the individual a satisfying substitute for the vanishing social institutions of extended family, tribe, and local community.

Utopianism is a common phenomenon among those whom Morris Watnick calls the "history-less" peoples of the world—those whose actions are governed by custom, and whose imagination spans only one generation.^{7,8} There it acts as a psychological safety valve for the trials of a difficult existence. When social institutions begin to break down or to change rapidly, this utopianism bursts forth frequently in desperate, futile peasant rebellions (e.g., the 16th century Bauernkrieg in Europe on the eve of the Reformation).⁹ Such rapid social change is occurring today in the Third World under the impact of new ideas.

This native drive for millennial rectification of perceived wrongs is usually directed against whomever is in authority as the society disintegrates. But it is doomed to achieve nothing unless it can be effectively organized. It can be organized by means of appropriate ideology and methods of control. Communism in its present form offers both. The elements of Marx's theory accord perfectly with the millennial dream of the peasant in time of stress "Alienation" and "class exploitation" explain his unhappiness, the "classless society" provides his goal, the "need for revolution" shows him how to act, and "historical determinism" gives him the sense of participation in an historical process.

Who then are attempting to use this ideology to control and manipulate the dissatisfied majority? Foreign agents? Local Communists trained in Moscow and Peking?

Most revolutionary leaders in the Third World are indigenous intellectuals who are otherwise excluded from positions of power in their societies, who find communism relevant to them personally, and who see it as the best tool to modernize their countries.^{10,11} In Marxist ideology they, too, find self-justification; in Communist organization they find the means to put themselves in power and to guide their societies toward the more sophisticated political systems necessary to survive in the last third of the 20th century. The backgrounds of Communist leaders have been found to be surprisingly similar to those of their local nationalist opponents.¹² Except in rare cases they are not workers or peasants, but men educated in modern ideas.

Here we find many similarities with prerevolutionary Russia and China (similarities which are not lost on Third World leaders). Communism was not imposed upon Russia from without. It was eagerly adopted by native Russian intellectuals who used it as a tool to overthrow Kerensky's provisional government, install themselves in power, and work for modernization. In China, after the nearly disastrous manipulations of Russian agents, it was a homegrown intellectual, Mao, who guided the country to a successful Communist revolution. A look at the biographies of current Vietcong leaders reveals few peasants and workers, but a high proportion of schoolteachers, architects, and engineers, whose "foreign training"

was usually acquired in Paris.¹³ It is especially with regard to these indigenous revolutionary leaders that we usually underestimate communism as a compelling, relevant force in the developing world by labeling such people "dupes," "foreign agents," or "Power-hungry cynics."

Does communism deliver what it promises to these modernizing nationalists? Although many of the promises are not kept, it does satisfy what is perhaps the greatest immediate *need* of their societies—not economic development, but political cohesion. The Communists offer effective government based on widespread mobilization of the community in political and economic programs. To label these governments totalitarian dictatorships may be true, but it does not tell the whole story—perhaps not even the most important part of it. The significant difference between the dictatorships of Ho and Diem was that Ho constructed the institutions necessary for a modern political system, while Diem did not. The United States' great failure in dealing with insurgency in the Third World has been that we have never offered these peoples an effective alternative to totalitarian control as a *rapid* means to political modernization. I believe we must try, for I believe that democracy and effective government are not mutually exclusive.¹⁴

Points 4 and 5 above probably need less discussion. It seems obvious that the old colonial powers appear as more of a threat to the new leaders than do Russia or China, partly because many of their economies are tied to the West (a fact which is seen as "nonpolitical" in the United States; after all, it's just business). These economic relations with the powerful, industrialized countries are often perceived in the developing countries as exploitation and, therefore, "neocolonialism." Witness our current problems in Latin America. Similar Soviet economic relations, such as the natural gas sales to Western Europe, are only just beginning and are therefore not so clearly perceived.

Furthermore, the Western Powers, in an unsophisticated, idealistic, and parochial manner have attempted to push the forms, if not the substance, of Western Constitutional democracy upon developing countries for whom these institutions are not very relevant—less relevant, in fact, than homegrown communism. These systems have in many cases been properly rejected or modified out of existence, and the new nations are now experimenting with their own institutions—sometimes with disastrous results. If we hope to encourage other peoples toward systems of government we believe best, we had better study carefully the elements in other systems which are perceived by them as more appropriate for their own needs.

The psychological rewards of modern communism as a substitute for decaying traditional social institutions have already been mentioned and explored. They are a powerful motivating force for which men will give their lives.

Hopefully, the above discussion will have demonstrated that the popularity of Communist ideas and the penetration of Soviet and Chinese

influence in the Third World have not been simply the result of tactics used by Communist insurgents to organize and control a population, but rather the result of the relevance of certain elements of Marxist ideology and Leninist political organization to conditions in developing societies. For our own national interest we simply cannot afford any longer to ignore these elements because of our hostility to "communism."

PROPAGANDA AND IDEOLOGY*

BY JACQUES ELLUL

Ideology limits propaganda; propaganda alters and destroys ideology.

THE TRADITIONAL RELATIONSHIP

A relationship between propaganda and ideology has always existed.

*Excerpts from "The Socio-political Effects," Chapter V in *Propaganda: The Formation of Men's Attitudes*, translated from the French by Konrad Kellen and Jean Lerner, Alfred A. Knopf, New York, 1965, pp. 194-202. From PROPAGANDA: THE FORMATION OF MEN'S ATTITUDES, by Jacques Ellul. Copyright © 1968 by Alfred A. Knopf, Inc. Reprinted by permission of the publisher.

The pattern of that relationship became more or less established toward the end of the nineteenth century. I will not give here an original or specific definition of ideology, but will merely say that society rests on certain beliefs and no social group can exist without such beliefs. To the extent that members of a group attribute intellectual validity to these beliefs, one may speak of an ideology. One might also consider a different process by which ideology is formed: ideologies emerge where doctrines are degraded and vulgarized and when an element of belief enters into them. However that may be, it has long been known that some ideologies are compatible with passive behavior, but most of them are active—*i.e.*, they push men into action.

Moreover, to the extent that members of a group believe their ideology to represent the truth, they almost always assume an aggressive posture and try to impose that ideology elsewhere. In such cases ideology becomes bent on conquest.

The drive toward conquest may arise within a society as a conflict between groups (for example, the proletarian ideology vs. others within a nation), or it can aim at targets outside, as a nationalist ideology will. The expansion of an ideology can take various forms: it can accompany the expansion of a group and impose itself on collectivities being embraced by the group, as with the republican ideology of 1793 or the Communist ideology of 1945, which accompanied the armies.

Or an ideology such as that of Labor in a bourgeois society may expand by its own momentum on a purely psychological plane. In this case, the ideology assumes a non-imperialist attitude; meanwhile it penetrates the group that represents such an attitude. In this fashion the ideology of Labor helped bring about the bourgeois orientation of all Western society in the nineteenth century.

Finally, an ideology can expand by certain other means, without force and without setting an entire group in motion: at that point we find propaganda. Propaganda appears—spontaneously or in organized fashion—as a means of spreading an ideology beyond the borders of a group or of fortifying it within a group. Evidently, in such cases propaganda is directly inspired by ideology in both form and content. It is equally evident that what counts here is to spread the content of that ideology. Propaganda does not lead a life of its own; it emerges only sporadically—when an ideology tries to expand.

Propaganda organizes itself in conformity with that ideology, so that in the course of history we find very different forms of propaganda, depending on what ideological content was to be promulgated. Also, propaganda is strictly limited to its objective, and its working processes are relatively simple in that it does not try to take possession of the individual or dominate him by devious means, but simply to transmit certain beliefs and ideas. That is the current relationship between ideology and propaganda. The classic pattern, still in existence in the nineteenth

century—and considered valid today by many observers—no longer prevails; the situation has undergone profound changes.

Lenin and Hitler found a world in which the process of ideological expansion was more or less set. But their intervention in this domain would be the same as their intervention in all others. What actually was Lenin's and thereafter Hitler's great innovation? It was to understand that the modern world is essentially a world of "means"; that what is most important is to utilize all the means at man's disposal; and that ends and aims have been completely transformed by the profusion of means. The fact that man in the nineteenth century was still searching for ends led him to neglect most of the available means. Lenin's stroke of genius was to see that, in reality, *in our twentieth century*, the ends had come to be secondary to the means or, in many cases, of no importance at all. What mattered was primarily to set all available instruments in motion and to push them to their limits.

Moreover, Lenin was carried along by the conviction that such extreme utilization of all means would, a priori, lead to the establishment of Socialist society. The end thus became a postulate that was easily forgotten. That attitude agreed exactly with the aspirations of the average man and with his firm belief in progress. That is why Lenin designed a strategy and a tactic on the political plane. There as elsewhere he permitted the means to assume first place; but that led him, on one hand, to modify Marx's doctrine, and on the other, to give the doctrine itself a level of importance secondary to action. Tactics and the development of means then became the principal objects even of political science.

With Hitler one finds precisely the same tendency, but with two differences: first of all, a total lack of restraint. Lenin envisaged the application of progressive, limited, adjusted means. Hitler wanted to apply them all, and without delay. Second, the end, the aim, the doctrine, which Lenin merely had demoted to second place, disappeared altogether in Hitler's case—the vague millennium that he promised cannot be regarded as an aim, nor can his anti-Semitism be considered a doctrine. Instead, we pass here to the stage of pure action, action for action's sake.

This completely transformed the relations between ideology and propaganda: ideology was of interest to Lenin and Hitler only where it could serve an action or some plan or tactic. Where it could not be used, it did not exist. Or it was used for propaganda. Propaganda then became the major fact; with respect to it, ideologies became mere epiphenomena. On the other hand, ideological content came to be of much less importance than had been thought possible. In most cases, propaganda can change or modify this content as long as it respects such formal and customary aspects of the ideology as its images and vocabulary.

Hitler modified the National Socialist ideology several times according to the requirements of propaganda. Thus Hitler and Lenin established an entirely new relationship between ideology and propaganda. But one must not think that Hitler's defeat put an end to that; actually, it has

become more widespread. There is no question that the demonstration was compelling from the point of view of effectiveness. Moreover, the trend launched by Lenin and Hitler touched on all prevailing ideologies, all of which now exist "in connection" with propaganda (*i.e.*, live by propaganda) whether one likes it or not. It is no longer possible to turn back; only adjustments can be made.

THE NEW RELATIONSHIP

These new propaganda methods have completely changed the relationship between propaganda and ideology, and as a result the role and value of ideologies in the present world have changed. Propaganda's task is less and less to propagate ideologies; it now obeys its own laws and becomes autonomous.

Propaganda no longer obeys an ideology.¹ The propagandist is not, and cannot be, a "believer." Moreover, he cannot believe in the ideology he must use in his propaganda. He is merely a man at the service of a party, a State, or some other organization, and his task is to insure the efficiency of that organization. He no more needs to share the official ideology than the prefect of a French department needs to share the political doctrines of the national government. If the propagandist has any political conviction, he must put it aside in order to be able to use some popular mass ideology. He cannot even share that ideology for he must use it as an object and manipulate it without the respect that he would have for it if he believed in it. He quickly acquires contempt for these popular images and beliefs; in his work, he must change the propaganda themes so frequently that he cannot possibly attach himself to any formal, sentimental, political, or other aspect of the ideology. More and more, the propagandist is a technician using a keyboard of material media and psychological techniques; and in the midst of all that, ideology is only one of the incidental and interchangeable cogs. It has often been stated that the propagandist eventually comes to despise doctrines and men. This must be put into context with the fact, analyzed above, that the organization served by propaganda is not basically interested in disseminating a doctrine, spreading an ideology, or creating an orthodoxy. It seeks, instead, to unite within itself as many individuals as possible, to mobilize them, and to transform them into active militants in the service of an orthodoxy.

Some will object that the great movements that have used propaganda, such as Communism or Nazism, did have a doctrine and did create an ideology. I reply that that was not their principal object: ideology and doctrine were merely accessories used by propaganda to mobilize individuals. The aim was the power of the party or State, supported by the masses. Proceeding from there, the problem is no longer whether or not a political ideology is valid. The propagandist cannot ask himself that question. For him, it is senseless to debate whether the Marxist view of

history has more validity than any other, or whether the racist doctrine is true. That is of no importance in the framework of propaganda.

The only problem is that of effectiveness, of utility. The point is not to ask oneself whether some economic or intellectual doctrine is valid, but only whether it can furnish effective catchwords capable of mobilizing the masses *here and now*. Therefore, when faced with an ideology that exists among the masses and commands a certain amount of belief, the propagandist must ask himself two questions: First, is this existing ideology an obstacle to the action to be taken, does it lead the masses to disobey the State, does it make them passive? (This last question is essential, for example, for propagandists who operate in milieux influenced by Buddhism.) In many cases such an ideology will indeed be an obstacle to blind action, if only to the extent that it sparks some intellectual activity, no matter how feeble, or provides criteria, no matter how insecure, for judgment or action. In this case the propagandist must be careful not to run head-on into a prevailing ideology; all he can do is integrate it into this system, use some parts of it, deflect it, and so on.² Second, he must ask himself whether the ideology, such as it is, can be used for his propaganda; whether it has psychologically predisposed an individual to submit to propaganda's impulsions.

In an Arab country colonized by whites, in view of the Islamic ideology that has developed hatred for Christians, a perfect predisposition to nationalist Arab and anti-colonialist propaganda will exist. The propagandist will use that ideology directly, regardless of its content. He can become an ardent protagonist of Islam without believing in the least in its religious doctrine. Similarly, a Communist propagandist can disseminate a nationalist or a democratic ideology because it is useful, effective, and profitable, and because he finds it already formed and part of public opinion, even if he himself is anti-nationalist and anti-democratic. The fact that he reinforces a democratic belief in the public is of not importance: one now knows that such beliefs are no obstacle to the establishment of a dictatorship. By utilizing the democratic ideology that Communism supports, the Communist party obtains the consent of the masses to its action, which then puts the Communist organization in control. Propaganda thus brings about the transition from democratic beliefs to a new form of democracy.

Public opinion is so uncertain and unclear as to the *content* of its ideologies that it follows the one that says the magic words, not realizing the contradictions between the proclamation of a catchword and the action that follows it. Once the "Machine" is in control, there can be no objection to it by those who adhered to the previously prevailing ideology, which is always officially adopted and proclaimed by the new organization in power. People live therefore in the mental confusion that propaganda purposely seeks to create.

In the face of existing, usable ideologies, the propagandist can take one of two paths: he can either stimulate them, or mythologize them. In fact,

ideologies lend themselves well to both methods. On the one hand, an ideology can be expressed in a catchword, a slogan. It can be reduced to a simple idea, deeply anchored in the popular consciousness. And public opinion is used to reacting automatically to the expressions of a former, accepted ideology: words such as *Democracy*, *Country*, and *Social Justice* can now set off the desired reflexes. They have been reduced to stimuli capable of obtaining reflexes in public opinion, which can turn from adoration to hatred without transition. They evoke past actions and aspirations. To be sure, if a formula is to be able to stimulate, it must correspond to existing conditioned reflexes that were forged gradually in the course of history by adherence to an ideology. The propagandist limits himself to what is already present. From there on he can use any ideological content at all, no matter where or when. Differences in application will be determined according to psychological, historical, and economic criteria, to insure the best utilization of ideology in the realm of action. I have said that ideology is a complex system capable of evoking one aspect while leaving out another; the propagandist's ability will consist precisely in making these choices.

On the other hand, the propagandist can proceed by transforming ideology into myth. Some ideologies can indeed serve as a springboard for the creation of myths by the propagandist. Such transformation rarely takes place spontaneously. Generally, ideology is quite vague, has little power to move men to action, and cannot control the individual's entire consciousness. But it furnishes the elements of content and belief. It weds itself to myth by the complicated mixture of ideas and sentiments, by grafting the irrational onto political and economic elements. Ideology differs radically from myth in that it has no basic roots, no relation to humanity's great, primitive myths. I have already said that it would be impossible to create a complete new myth through propaganda. However, the existence of an ideology within a group is the best possible foundation for the elaboration of a myth. In many cases, a precise operation and a more pressing and incisive formation will suffice. That the message must be formulated for use by the mass media automatically contributes to this: the fact that the widespread belief is now expressed in one-third the number of words and shouted through millions of loudspeakers, gives it new force and urgency.

The coloration supplied by psychological techniques, the power of efficiency demonstrated by the integration in an action, the over-all nature attributed to the construction of an intellectual universe in which ideology is the keystone—all that can be accomplished by the propagandist. In such fashion Socialist ideology was transformed into myth by Leninist propaganda, patriotic ideology became national myth, and the ideology of happiness was transformed into myth at the end of the nineteenth century. In this fashion, too, the myth of Progress was constructed from a group of propagandas based on bourgeois ideology.

Finally, the propagandist can use ideology for purposes of justification.

I have shown on several occasions that justification is an essential function of propaganda. The existence of a generally accepted ideology is a remarkable instrument for providing a good conscience. When the propagandist refers to collective beliefs, the man whom he induces to act in accord with those beliefs will experience a feeling of almost unshakable self-justification. To act in conformity with collective beliefs provides security and a guarantee that one acts properly. Propaganda reveals this consonance to the individual, renders the collective belief perceptible, conscious, and personal for him. It gives him a good conscience by making him aware of the collectivity of beliefs. Propaganda rationalizes the justification that man discovers in the prevailing ideology, and gives him the power to express himself. This holds true, for example, for the ideology of peace utilized by the Communist party: as soon as this ideology is used, everything, even hatred, is justified by it.

For a long time, man's actions, just as certain of his reactions, have been partially inspired by ideology. The masses may act because of a spontaneous belief, a succinct idea accepted by all, or in pursuit of an objective more or less vaguely outlined by an ideology; democratic ideology sparked such behavior. But the relationship of ideology to propaganda has completely changed this.

In a group in which modern propaganda is being made, man no longer acts in accord with a spontaneous ideology, but only through impulses that come to him from such propaganda. Only the ignorant can still believe that ideas, doctrines, beliefs can make man act without the utilization of psycho-sociological methods. Ideology not used by propaganda is ineffective and not taken seriously. The humanist ideology no longer provokes a response: in the face of modern propaganda, intellectuals have been completely disarmed and can no longer evoke the values of humanism. Torture (of political enemies) is implicitly accepted by public opinion, which expresses its dismay only in words, but not in action. With regard to the war in Algeria, it is well known that the most ardent defenders of P. H. Simon (a young lieutenant who exposed the practice of torture during that war) defended him only verbally and when they could afford to: once they were in combat, plunged into action, such "ideas" were relegated to a secondary level, and the F.L.N. and military propaganda—which, on both sides, accused the enemy of torture and thus legitimized its own actions—took over again. The same is true for Christian ideology, which no longer inspires action: Christians are caught in a psycho-sociological mechanism that conditions them to certain practices, despite their attachment to other ideas. Those ideas remain pure ideology because they are not being taken over by propaganda; and they are not taken over because they are not usable. In this fashion, such an ideology loses its reality and becomes an abstraction. It loses all effectiveness in relation to other ideologies being used by propaganda.

Moreover, in this relationship between ideology and action, we emphasize that nowadays action creates ideology, not vice versa, as the

idealists who relate to past situations still would like to believe. Through action one learns to believe in "some truth," and even to formulate it. Today, ideology progressively builds itself around actions sanctioned by propaganda. (For example, in order to justify certain actions in Algeria, an entire, complex ideology was created.) Thus, in various ways—all the result of propaganda—ideology is increasingly losing its importance in the modern world. It is devalued whether propaganda uses it or not; in the latter case because it reveals its ineffectiveness and cannot prevail against the competition; in the former, because when used, it is broken up: some aspects of it are used and others pushed aside.

The same holds true for ideology as for doctrine; when propaganda uses it, it destroys it. The transformation of the Marxist doctrine by propaganda, first Lenin's and then Stalin's is well known. Works such as those by P. Chambre, de Lefèvre, and Lukacs explain this "evisceration" of doctrine by propaganda very well. All that is believed, known, and accepted is what propaganda has promulgated. It is the same for ideology, which is merely a popular and sentimental derivation of doctrine. One can no longer establish anything at all on genuine ideologies in social groups; one can no longer hope to find in such ideologies a solid point of support for redressing man or society. Ideology has become part of the system of propaganda and depends on it.³

* * * * *

NOTES

¹ Ideology plays a certain role in propaganda. It can prevent propaganda from developing when the governmental centers themselves are the seat of an ideology. . . . On the other hand, it has been shown how the belief in certain utopias (goodwill of the people, harmonization of international interests, and so on) is also a negative factor here, just as the ideology of democratic elites is less suitable than that of an aristocracy as the basis for a propaganda plan. Conversely, when the belief of the elites is progressive, it will lead to a powerful propaganda. Thus ideology partly determines whether a climate is favorable or unfavorable to the creation and use of propaganda, but it no longer is the decisive factor.

² This is why one ideology cannot serve as a weapon against another ideology. Propaganda will never proclaim the superiority of an ideology over that of the enemy, for in doing so it would immediately fail. Against an opposing ideology one can only counter with a waiting attitude, an attitude of hope, and with questions as to what the future will bring. By thus asking an ideological adversary concrete questions pertaining to the future, the propagandist follows Marx's method of "progressing from language to life."

³ This can have decisive consequences, for one must not forget that this is the road by which a change in "culture" (in the American sense of the word) can take place, that is, a true change of civilization, which was so far maintained by the stability of ideologies and "chain-thinking."

PSYCHOLOGICAL TOTAL WAR*

BY BERNARD YOH

Social contradictions may be used by or against revolutionary ideology.

Psychological warfare has been used throughout military history as one

*Original essay by Bernard Yoh.

among many tactics to attain military goals. The use of psychological initiatives—for example, ruse, showing the flag, war cries, threat—in conflict has often brought about the turning point of a battle or war. Yet, even more often, these techniques have been learned and used haphazardly without having been systematically studied and taught.

Historically, the people who have used psychological warfare most extensively are the Chinese. (The Chinese historical novel, *The Three Kingdoms*, describes numerous battles in which psychological tactics played an important part.) And in the words of Sun Tzu, the best known strategist in China (200 B.C.), “The first choice is to conquer a nation without fighting a war.”

TRADITIONAL PSYCHOLOGICAL WARFARE VERSUS PSYCHOLOGICAL TOTAL WAR

In the Western world, medieval concepts of chivalry evolved into the unwritten rules of “conventional” warfare, which characterized both world wars and numerous smaller conflicts. The “Marquis of Queensbury” approach discouraged the use of psychological techniques, which were considered underhanded and unethical.

Even today, psychological warfare is limited by inadequate study, incomplete understanding, and suboptimum use. In the military forces of most Western countries there is little dedication to the use of psychological operations and relatively slight stress upon its development as a weapon.

Communist doctrine, however, puts a high priority upon psychological warfare. Indeed, military action is viewed by Communist armed forces as a tool for the achievement of a psychological condition which will in turn bring about the realization of political objectives. This reversal of priorities has created a new dimension in warfare.

One indication of this change is in the structure of Communist armed forces. Every unit from a platoon to an army has one or more “political cadre member” or “political commissar” to oversee the psychological implementation at every level. They are usually of equal rank to the commanding officer. But regardless of rank, the political officer always has the last word on all policy decisions. Furthermore, the political officer has his own chain of command and communication—outside the regular military organization—directly to a member of the politburo.

This emphasis on thorough indoctrination and consistent predominance of political objectives even at the lowest levels is designed to guarantee the psychological contribution to the campaign, to insure that each member of each military unit is a “true believer,” is devoted to his cause, is prepared to make the sacrifices requisite for furthering that cause, remembers to place all military circumstances in their “proper” political contexts, and is awake to the psychological potential inherent in every situation.

GUERRILLA WARFARE: THE BAIT—SOCIAL DISORDER: THE TRAP

Since the end of World War II, numerous revolutionary groups have challenged the legitimacy of governments in Africa, Asia, and Latin America. Having recognized their conventional military inferiority in personnel and equipment, many have relied upon guerrilla techniques to overthrow the incumbent regimes. However, it has rarely been the strategy of revolutionaries to rely on guerrilla military successes alone. Instead, aware of the Communist conception of psychological total war, they have concentrated much of their resource base and many of their hopes on psychological victories—the creation of dissension, dissatisfaction, and disorder in society.

As the government focuses on the “war effort” and asks greater sacrifices of the nation, severe strains are placed on the loyalty, patience, and understnading of the populace. It is this increased cost that the government demands of its citizenry that the guerrilla hopes to exploit.

CONTRADICTION AND IDEOLOGY: A PAIR OF TWO-EDGED SWORDS

The philosophy of the revolutionary is to “utilize contradiction, control contradiction, and promote contradiction.” These “contradictions” are therefore the seeds of destruction of government, powerful psychological tools the incumbent regime provides the insurgent. The objective of the government that wishes to preserve its dominion in the face of such a challenge is clear, then: it must eradicate contradiction between the government and the people. Corruption, electoral fraud, power abuse, ineffectual and arrogant bureaucrats may be fatal to a government under revolutionary siege.

On the part of the revolutionary force, ideology is often a powerful weapon because its sweeping generalizations allow many charges to be levelled at government in the name of ideology. But ideology also constitutes a potentially severe handicap to the revolutionary forces. If the generalizations can be used to castigate specific programs of the government, they can also be employed by the government to point out contradictions between revolutionary beliefs and the underlying attitudes and traditions of the population.

Too often, however, governments, concentrating on control of the economic, political, and military environments in which the revolution has developed, have neglected the potential for a psychological offensive, have neglected to use ideology to defeat insurgents through their own contradictions. The primary objective of psychological total war must be to marshal all available societal resources to secure the allegiance of the communications media, the intellectual and academic community, the organized and professional political elements, the rural community, the

workers, and the business community. The support of each is necessary to government success. And the allegiance of all can only be secured by imaginative use of psychological stimuli. When these six basic components of society are definitely won over to the government cause, the revolutionary forces are destined to fail in their own goals. They will have lost to the technique mastered by their forebearers: psychological total war.

PROPAGANDA

The purpose of this section is to illustrate many of the principles discussed earlier in the context of diverse propaganda appeals from governments and insurgent groups around the world.

The geographical grouping used here is arbitrary. Different criteria could be employed to group such appeals. For example, propaganda is often dichotomized: revolutionary versus status quo; developed versus underdeveloped; democratic versus totalitarian; Communist versus non-Communist; government versus insurgent; and the like.

None of these dichotomies is satisfactory for the broader purposes of this casebook. Eventually, most governments will either abjure the use of ideology or force it to conform to the state's needs. Propaganda is used to support the interests of the communicating entity, interests that, in terms of the study of communications, need not usually be considered in country-specific terms.

Therefore, to conform to the purposes of this casebook, what follows here are grouped essays dealing with political matters almost exclusively (while in fact governmental propaganda addresses a wide range of subjects). However, these articles, though primarily political in emphasis, focus on objectives, methods, media, policy planning, and organization. They are arranged on the basis of origin of the propaganda.

Western Europe

THE PROJECTION OF BRITAIN ABROAD*

BY MAX BELOFF

Cultivating the desired image of a country in foreign audiences is an extraordinarily complex undertaking. The high costs support the thesis that reevaluation and analysis of techniques and effects should be a continuing function of government. A positive image can be created that is still not the desired image.

* * * * *

Efforts directed towards creating a favourable image of one's own country are nothing new in the history of inter-state relations. The monarchs of the *ancien régime* who spent so much money on palaces and spectacle, who patronised the arts and men of letters, were clearly not

*Excerpts from "The Projection of Britain Abroad," *International Affairs* (London), XLI, no. 3 (July 1965), pp. 478-489. Reprinted with the permission of Oxford University Press and the author.

insensible to the political dividends to be drawn from such investments. It would be surprising if Britain were not concerned in this form of peaceful competition for:

If it is true to say as we believe, that of all the great Powers none is so dependent, for reasons of security and trade, on maintaining friendly relations with other countries as is the United Kingdom, then logically this country should spend more, in relation to population and resources, than other countries in order to maintain efficient Information Services overseas.¹

Nor is . . . [one] correct in assuming that information work can be limited to promoting particular ends of British policy as distinct from a more generalised projection of Britain's image. On the contrary, unless people have a high regard both for the country which is endeavouring to persuade them of the advantages of a certain course of action, and for the credibility and reliability of the institutions through which it purveys information in support of its views, the machinery available will not be able successfully to perform its required function when a specific case arises. Successful work in the information field demands a high degree of continuity both as to the regional area of concentration and as to the substantive content of what is offered. It cannot simply be turned on and off at will.

Finally, . . . the image that is used to attract tourists to this country, the beefeaters and thatched cottages—and that is for this specific sphere extremely successful, does in fact handicap the country's efforts to project quite other facets of Britain which are important for our commercial and even our political objectives. Tourists want to visit museums and antiquities; but a country whose image is limited to this aspect will hardly be looked to as a source of industrial equipment or new ideas in the fields of science, education, social institutions and so forth. We surely have no wish to see Britain regarded in the 20th century as was Italy in the 18th.

* * * * *

It is a perfectly valid point that it is much harder to individualise the appeal of a country which wishes to present itself as being in the vanguard of scientific or industrial advance; there is a common style pervading much of modern industrial civilisation, and national differences may be thought of as marginal, or as only perceptible to the expert in a particular field. But the fact that something is difficult does not mean that it is not worth doing. It is also true that rewards of investment in this field are very difficult to measure, though some would argue that modern market research is not without its application here; and the BBC has by now a relatively long experience of gauging the size of its foreign audiences, and the impact of its programmes upon them.

Furthermore, there are aspects of the effort itself which lend themselves to direct assessment. It is possible, for instance, to evaluate our exports of books, and reckon up the number of British books that secure translation into other languages. It is possible to work out the proportion of students from other parts of the world who come to our institutions of higher education to acquire specialised skills and more general prepara-

tion for positions of leadership in their own societies. It is harder, but it should not be impossible, to get some idea of their quality, and to know whether we are getting the best representatives of their generation or only those who cannot go elsewhere. We should be able to derive some information from the coverage of British affairs in the foreign Press and discover whether we need to do more to assist both resident correspondents, and the larger number of foreign journalists who come for shorter periods under official auspices.

In addition to such possibilities of concrete evidence as to Britain's standing there are other and more personal impressions to be evaluated—the feelings, for instance, that scientific, academic and other professional men derive from their travels and their contacts with foreign colleagues, a rather underworked vein in some people's view. And there is, above all, the large mass of information at the disposal of the world of business. Such impressions can at least be checked with advantage against the changes in the regional distribution of expenditure by the Foreign Office, the [Commonwealth Relations Office] CRO, the British Council and the BBC.

* * * * *

Naturally this does not mean that there is a direct relationship between the efforts of information or cultural agencies and the popularity of the country concerned. Other and more powerful motives may come into play. For instance, there is some reason, one would imagine, to believe that there is more latent goodwill towards Britain in that Cinderella-continent, Latin America, despite its relative neglect in these respects, than in the Arab Middle East which has absorbed a very high proportion of the total British effort. Indeed, the question of whether one should row with or against the tide is one of the hardest to answer; but the responsibility clearly lies with the policy-making departments rather than with the information agencies, and need not be much further explored here.

But one comment is perhaps in order. There is in Britain's case a peculiar political complication (not faced by the French or Germans) that arises out of our doubly complicated relationship with the United States. In the first place we are allied as the principal competitors with the Communist Powers for access to the hearts and minds of the "uncommitted" nations. In the second place, there is the fact that both we and the Americans are protagonists of the use of English as a "second language," and that individuals who have acquired the use of English can freely choose between British or American books, broadcasts and so forth, and are equally able to pursue higher studies or training in the United States or in the English-speaking countries of the Commonwealth, including Britain herself.

From these facts some people would draw the conclusion that it should be a matter of indifference to us whether it is the British or the American effort in the information field that prospers in any particular part of the world. Provided that the students we lose go to America and not to China or Russia, or provided the foreign literature in circulation is American

and not Communist, we have nothing to worry about and might indeed welcome on financial grounds the substitution for our own efforts of American ones.

Against this there is the alternative argument that the general similarity of our ultimate political objectives presupposes neither universal coincidence of opinions nor the absence of competition between ourselves and the United States. It is clearly not a matter of indifference to us whether British or American aircraft, automobiles or other industrial goods are bought by particular customers; nor, as we have all too good reason to know, is this matter of indifference to Americans.

Such commercial preoccupations have their counterpart in the informational and even cultural undertakings of the two countries. If students of technical subjects use British texts or go for training to Britain, the odds are that the apparatus they will want their countries to acquire will be British also. If the links they establish are with the United States, so too will the United States become the country to which they continue to look after their professional or industrial careers are established. It is true that the demands of the "underdeveloped" world are so enormous that Britain and the United States together cannot hope to meet them all; perhaps all the resources of all the developed countries are likely to fall short of what is needed. But we want to be in a position to choose how to direct our own limited resources, and in the matter, for instance, of bringing students to our universities to make certain that we get a fair proportion of the best ones.

If one accepts this view, certain practical consequences follow. For it is also certainly the view taken by the Government of the United States. It is perhaps most obvious in the field of book exports, which is of direct commercial interest to us quite apart from the impact it may have upon the "projection of Britain" at large. The American Government has gone much further in a variety of ways in facilitating the export of books to the "underdeveloped" countries and in subsidising or guaranteeing publishers in a variety of ways than our own Government has hitherto shown itself prepared to contemplate. And there are no signs that the United States would be prepared to regard the promotion of literacy in English, or the supply of educational material, as a co-operative rather than a national effort. In the circumstances the adaptability and performance of the British publishing industry is one of the most creditable parts of the record; but it may find itself outgunned if it is left to fight its own battles.

Where a more short-term appreciation of British attitudes is concerned, newspapers and magazines matter more than books. Here again, there is an element of competition though not in so direct a fashion. On the one hand there are the airmail editions of the English "quality" newspapers, whose growth is limited by their unprofitability—duties on newsprint are the obvious handicap imposed by the Government on their development. There is also the international role of "Reuters" as a supplier of news and trainer of journalists for overseas countries.

On the other hand there is the blanketing of the world market for news by *Time* magazine and to a much lesser extent by other similar American publications. It is not clear that there is any way in which this situation might be remedied to our advantage; there may well be economic reasons that rule out an operation of this kind from a British base. But that does not mean that the effects are not serious. It is worth reminding oneself, when people talk of British influence "east of Suez" or of reviving our links with Latin America, that for a large proportion of the people whose interest or support we wish to attract, what they know about Britain is what *Time* magazine can find room for, and that any voice that Britain may have independent of America's in world affairs must be a muffled one.

* * * * *

In these circumstances our position depends very much on what advantages we can take of media that depend less on language, or where indigenous languages can be used with greater freedom, namely radio and television. One is, of course, familiar with the fact that the wartime effort of the BBC provides a remarkable example—perhaps the most remarkable of all—of the rapid exploitation to the utmost of what was still a relatively new technique. But wartime provides a stimulus of its own. Furthermore, from the technical point of view, one was trying to reach an audience much of which was located conveniently near at hand. World-wide coverage is another matter, and if this is to be successfully achieved at high quality, much capital expenditure will be required for new relay stations and their equipment, as well as an increase in current expenditure. The direct return in the shape of sales of receiving equipment may be less important, since radio receivers of the cheaper kind are suitable for production in many countries. But in sound radio—whether it be direct broadcasts or transcription services—we start with some considerable advantages, which should not lightly be thrown aside.

The coming of television presents a more difficult problem. In the present preparatory phase where television is still for the minority (outside the advanced industrial countries) and where access to it is to be had by other countries mainly through the provision of films or other "canned" material, international competition takes the form of bids for supplying transmitters and studio equipment, and of offers to assist in the training of technicians and producers, which is a more complicated affair than it is for sound radio. Success in this important, though little publicised, form of competition (which involves private firms as well—in view of the dual structure of British television) may have direct economic consequences on the sale of receiving equipment, but it will also influence the choice of programmes by such stations, and therefore have a direct impact upon the image of Britain that is presented.

But as has been suggested, all this may only be a preliminary stage before we come to the television era proper. What at present distinguishes television from radio is its short initial range. We cannot even watch European programmes unless channelled to us through Eurovi-

sion. There seems a consensus of opinion that the development of earth-satellites will one day make this limitation obsolete. "Early Bird" shows what a relay through national networks can do: what will come is direct transmission which any individual can pick up as he can foreign radio broadcasts on short wave. The only question in dispute is how soon. Once this happens we may be in for a very fierce competition of a new kind, of which the lineaments are only dimly visible. We do not fully know what the immediacy of visual images can do in creating attitudes and responses; though we know something from Hollywood's effect upon the foreign image of America. It is certainly a case where considerable advance thought should be given to what is to be done, not forgetting the rather terrifying financial implications of entering this new epoch in the history of the international use of mass-media.

Even if we make the decision that to some extent Britain must project herself through all the means available to her, the problems do not end here. Britain has both advantages and disadvantages when it comes to competing in this field. The advantages consist in a high degree of professionalism, particularly but by no means exclusively, in radio, and the proved ability to communicate a national message without either the exaggeration that defeats its ends, or the vulgarity that goes with too pronounced an infusion of commercialism. We have managed with some skill to give the BBC a reputation for objectivity not subjected to the transient policies of individual British governments. The printed output of the Central Office of Information—the service organisation for all the field operations of the information services—shows a fairly consistently high quality of content and design within certain limits of expenditure which may be more tightly drawn than those of the Americans.

But it is more important to be conscious of what our weaknesses are, and to have some idea as to how to set about correcting them. One difficulty here is to fasten responsibility for the whole range of information and cultural services and the media through which they operate. Since some of the weaknesses can only be corrected through actual additional expenditure it would seem desirable that there should be a single Minister to decide upon priorities and to press the demands of these services upon the Treasury and the Cabinet. . . . On the other hand, not every Prime Minister has some actual or potential Cabinet colleague equally suited to the task.

* * * * *

There is in Britain a not altogether suppressed nostalgia for an imperial past. It is perhaps this underlying wish to strike paternalist attitudes quite as much as deep political calculation, that makes such activities as teaching elementary English, or now-a-days rather training teachers, or teaching teacher-trainers the kind of thing most readily acceptable, as obviously desirable in itself, as compared with, for instance, the projection of Britain to more sophisticated audiences.

We have already noted this fact in connection with the post-Drogheda shift away from Europe in the weight of the British Council's activities.

. . . Whatever may be said about the advantage of a variety of experience in the case of diplomats, the case in respect of some aspects of the British Council's work remains unproven. And this is particularly so where it is a matter of projecting Britain at the rather sophisticated level of contacts with national academies, universities and other cultural institutions, where a rather deep acquaintance with a particular country's language and civilisation are essential to success.

* * * * *

A similar preference for paternalist enterprises is shown in the decision to make the Ministry of Overseas Development responsible for relations with UNESCO. While it is true that the inculcating of mass-literacy has recently overshadowed the original scientific and cultural purposes of the organisation, it hardly seems a reason for abandoning the latter altogether, or for manifesting Britain's lack of interest in them.

* * * * *

But there is, of course, another reason for the shift towards this exclusive preoccupation with the educational needs of developing countries, and that is the general failure of the British Government (and public) to appreciate the extent to which a country's scientific and cultural achievements are an important aspect of its prestige abroad. This failure is shown in many ways. No attempt has been made to get any of the international bodies through which contacts in the natural sciences, social sciences or humanities are maintained to set up their headquarters in London, or to hold their conferences and seminars in Britain. When they meet in foreign capitals, the British Embassies rarely pay the same social attentions to the delegates as do the Embassies of other major countries. No attempt has been made to exploit the fact that in both the natural and the social sciences many of the officers of such bodies have so far been nationals of this country. No doubt the fault is not all on one side; academics in Britain tend to fight shy of officialdom in the way their continental colleagues (who are, after all, themselves officials) do not. But the gap is patent.

The fact that the teaching profession in Britain is not part of the service of the central government has other consequences as well. It is not easy to obtain from hard-pressed local authorities a massive secondment of teachers such as the French have made in order to secure the perpetuation of the French language in their former imperial possessions; nor can those who go overseas receive such ready assurance that their career-prospects will remain undamaged. Similarly the British Council cannot call (as can the *Relations Culturelles* of the Quai d'Orsay) upon British university teachers to spend part of their career directing Institutes abroad.

But this is a parenthesis. The third major weakness on the British side arises from a certain suspicious puritanism. We mistrust the showy; yet in modern conditions a direct visual appeal may be essential. It is no good sending abroad highly talented cultural representatives of well-selected

libraries and hiding them away up flights of stairs in dingy and uglily-furnished buildings. It is natural that when pressed for funds, the British Council should rather spend them on men than on "plant." But where the projection of Britain is concerned, "plant" tells as well, and the choice is not one that should have to be made.

Less importance should be attached to what might be called "*Daily Express* puritanism"—the view that no public money should ever be spent on disseminating the products of Britain's artistic genius. In fact, the fine arts take up only a very small proportion of the British Council's outlay while reaching elements in foreign élites that can be appealed to in no other way. The main problem is that theatrical and ballet companies and orchestras are extremely expensive to send abroad while in the particular case of the theatre there is a very easy descent from the best we have to offer, for which the demand is insatiable, to the merely mediocre which may easily do much more harm than good.

There is the further difficulty of the conflict between the ancients and the moderns. Shakespeare is our best-selling line, but in what sense is even the best production of Shakespeare a projection of modern Britain? And to have to choose amid the pitfalls of the modern drama is asking too much of a semi-official body. Luckily, in the visual arts, particularly sculpture, this difficulty does not arise. We have there an open door. But in general the idea that a British government might indulge in frivolously extravagant expenditure upon the fine arts has only to be stated to be seen for the nonsense it is.

The fine arts have, of course, the further advantage that they can be regarded as less politically-oriented than some other aspects of our cultural offering. It is therefore easier to include cultural exchanges, in this sense, in conventions with countries where access to all external stimuli is government-controlled. On the other hand we should not be content with this. Such exchanges may prove that both we and the country concerned are capable of reaching high levels of excellence in the theatre, the ballet or whatever the particular field of activity may be; but not much more follows from this than from similar demonstrations in the field of sport. We are proving in an agreeable way what no one ever doubted. What we are concerned to do is to increase our knowledge of these countries in a much deeper sense, and to project an image of our society which can correct the distortions to which it is subjected by foreign official propaganda, and thus serve direct political purposes.

We are, then, trying to do something which the other participants in such negotiations wish to avoid. We are already an open society which they can study if they wish but do not on the whole wish to, unless for very specific and material reasons. They are closed societies which want to drive the hardest bargain they can, in return for any chink in the curtain they are willing to open to us. One feels that those who are unacquainted with the difficulties of such negotiations, with the very tiny allotment of student places that we can secure, with the almost insuperable barriers still erected against access to our books, magazines and films,

are very often completely at sea in assessing either the cultural and political developments within such countries, or the role that cultural contacts abroad play in their scheme of things. Such countries think in terms of "delegations" and "manifestations"; we in terms of individuals and their direct interests. Possibly recent relaxations in the jamming of broadcasts should be taken as heralding an easier era in this respect, but one has the feeling that of all aspects of the task of "projecting Britain," this is by far the most difficult.

There is indeed one important additional reason for saying so. When we come to presenting our social and political institutions and ideas—and these parts of our culture are by no means insignificant—the most acceptable method is through free discussion. We want to show what we do and also discuss with others how they do things and where our ideas differ or coincide. Such a combination of the projection of Britain with free discussion is by far the most effective way of making the desired impression and arousing a permanent interest. Participation is always more effective than passivity. For this reason the institution known as Wilton Park, which has done this first on an Anglo-German, then on a European and now on an Atlantic basis, has some claims to be the most successful venture in this field that the British Government has ever undertaken. It would seem in many, though not of course all respects, both more effective and more economical than the sponsored tours of Britain by foreign journalists or politicians, which are its main competitors. On the other hand, the formula is almost impossible to apply to exchanges with countries where a high degree of totalitarian uniformity and dogmatism prevails. The one comparable Anglo-Soviet venture can hardly have been termed a success; nor have the Russians been willing to repeat it. Anglo-Polish exchanges understandably have shown much more promise. But the essence of the formula is free discussion between individuals in which a national uniformity of view is specifically excluded.

* * * * *

But one comes back in the end from questions of organisation and media to questions of content and purpose. Our purpose can be stated clearly. We wish to present Britain as a country which, despite its loss of relative power in the world, can still offer much of interest in both the material and intellectual sphere. We know that there are difficulties in our internal arrangements for making our most recent and exciting achievements readily available for projection overseas. The fact that Britain's not inconsiderable output in important branches of the social sciences is so little known outside the Commonwealth may be due to the fact that there is as yet no organisation to do for the social sciences what the Royal Society has so long done for the natural sciences, and what that odd and secretive body the British Academy is now attempting to do for the humanities. But the difficulties are partly due to our ignorance of ourselves. How can we expect to explain to foreigners what British universities have to offer when we read such ill-informed nonsense about them in the British press itself, and find it believed by those who should

know better? We have only recently become a fully self-conscious society, and some of the self-consciousness takes such morbid forms that the less it produces in the way of export, the better. We would not like to be judged on the basis of BBC "satire" any more than by the "beefeater, thatched cottage" image.

The content of our self-projection can thus be negatively defined. It is further limited by the country's own achievements. The best advertising is no use if the product is no good. All one can ask is that those responsible for informational and cultural work are fully acquainted with those aspects of the nation's achievements in which we may genuinely take pride. They should therefore have a sensitivity to developments in society and thought which, even if they have no direct mass-appeal, may still impress the élites of other countries. They must not allow enthusiasm for a new post-colonial role (with an expiation complex lurking in the background) to overshadow the importance of our dealings with highly advanced countries, whether or not these are friendly disposed towards us.

It would be absurd to compare the importance for Britain's international standing of her informational and cultural activities with the skill of her statesmen, the productivity of her industries or the courage and efficiency of her fighting men; but they remain an important part of our national armoury; their cost if not enormous is not negligible, and is almost certain to rise for the technical reasons already stated. It is one of those occasions when one must conclude by saying: if the thing is worth doing at all, it is worth doing as well as it can be done.

INTERNATIONAL FILM AND TELEVISION PROPAGANDA: CAMPAIGNS OF ASSISTANCE*

BY BERNARD RUBIN

All countries engage in propaganda, the more highly developed states more heavily than developing societies. As each government emphasizes the themes it considers to be most important to its national interests, different audiences attend to communications at levels based upon their perceived interests.

* * * * *

WESTERN EUROPEAN FILM AND TELEVISION PROPAGANDA

Western European countries have developed sizable film and television programs for international persuasion purposes, emphasizing trade, cultural, and political objectives. France and Britain exchange information

*Excerpts from "International Film and Television Propaganda: Campaigns of Assistance," *The Annals of the American Academy of Political and Social Science*, Vol. 398 (November 1971), pp. 81-92. Reprinted with the permission of the American Academy of Political and Social Science and the courtesy of the author.

with the independent countries formerly in their colonial empires. Both nations look to the maintenance and enhancement of important trading areas within the cultural regions they helped to shape in the past. The Federal Republic of Germany is anxious to win understanding for its political point of view and customers for its commercial and industrial offerings. All three nations are representative of the highly developed democracies whose main propaganda is geared to peaceful exchanges of information and technology.

Great Britain

Great Britain's overseas film and television program is largely directed by the Central Office of Information (COI), which works in close cooperation with other government departments and with relevant private organizations. On the film side, the *Overseas Film Library Catalogue 1970-71*, published by the COI for the benefit of potential clients, offers hundreds of productions dealing with British culture and history, Commonwealth developments, governmental planning and services, science and technology, sports and recreation, the arts, agriculture, commerce, industry, and labor.

An essential aspect of the enterprise is the determination of all concerned to "put Britain across" in its export program. A senior British official writes: "The promotion films we acquire—mainly for non-theatrical showings—are most important . . . and the trade theme features prominently in our television programs."¹

The over-all effort is impressive. In 1968/69 the COI distributed a weekly cinema newsreel to seventy-nine countries, two monthly and one bimonthly cinemazine programs going to fifty-one countries, and eleven weekly television programs going to ninety-two countries. In that same period, COI completed twenty-six films requested by government departments concerned with home affairs and four on behalf of the Foreign and Commonwealth Offices. Two hundred and ten other films were acquired from commercial sources—mostly industrial—and of those, ninety-seven were distributed overseas.

Approximately 150 Commonwealth, colonial, and foreign lands receive COI films each year. . . .

The Films and Television Division of the COI cooperates closely with the British Broadcasting Corporation (BBC) and the Independent Television Authority (ITV). Reuters, the BBC, and the Australian, Canadian, and New Zealand broadcasting authorities form the partnership known as VISNEWS LTD., the news film agency which provides a daily international news service on film to television subscribers in sixty-eight countries.² The BBC and the ITV each distribute about sixteen thousand television programs a year to more than eighty countries.

By and large, the COI is reticent about the successes and failures of the film and television productions sent abroad. It states:

No attempt is made to evaluate the total film and television programmes. Comprehensive usage reports are called for each year from overseas posts on a sample range of films. In the television field, user stations are asked to report times and frequency of use.

The Federal Republic of Germany

The Federal Press and Information Office in the Federal Republic of Germany cooperates closely with several quasi-official and private organizations. Inter-Nationes, the German association for the promotion of international relations, is a non-profit institution primarily responsible for cultural programs. Official government missions abroad maintain inventories of films listed in the Inter-Nationes catalogue. Those missions thus act as clearing houses for a wide range of German organizations. They include: *Institut für Film und Bild in Wissenschaft und Unterricht*, *Institut für den Wissenschaftlichen Film*, and *Deutsches Industrie-Institut*. The only limitations imposed by the missions before they will pass requests along to Inter-Nationes are that the clients order no more than four films from any one organization at a time, and that the order be placed a month ahead of the screening date.

Following other leading Western powers, the West German government maintains film archives in key cities abroad and film depots to serve regional interests. "Kultur" institutes in seven less developed countries also serve as presentation centers for television and film works.

Trans-Tel, the only non-government TV organization partly sponsored by the federal government, is headquartered in Cologne. Its statutes forbid Trans-Tel to distribute in Europe, the United States of America, Canada, Australia, and Japan. Television companies, acting directly through their commercial agents, deal with those markets.

Trans-Tel does not produce anything itself but, from the two German networks, merely selects, edits, and dubs TV programs that promise to be of cultural, instructional, or public relations value in the developing countries. The fees are relatively low.

Because there is no governmental television agency in the Federal Republic, this joint undertaking of the two major and rival West German television services, *ARD* and *ZDF* (*Arbeits-gemeinschaft der Rundfunkanstalten der Bundesrepublik Deutschland*; *Zweites Deutsches Fernsehen*), is of prime importance in the success of foreign relations.

For the international market, Trans-Tel "employs international teams of experienced film editors and commentators whose job it is to adapt and tailor the films, synchronizing them in English, French, Arabic, Portuguese and Spanish." By and large, adaptations of TV programs are handled by the staff of *Deutsche Welle*.³

France

The French government's film and television overseas enterprise in the Ministry of Foreign Affairs works closely with other government organizations such as the *Office de Radiodiffusion Télévision Française*

(ORTF) and the *Office Français de Techniques Modernes d'Éducation*, and private companies.

In scope, the program ranges as widely as the American, British, and German, emphasizing distribution of film magazines, cultural films, television program series, theatrical films (several subtitled in English, Arabic, and Spanish), newsreels (Great Britain is the other main supplier of newsreels), educational films, and courses of instruction in the French language.

During 1970, the Ministry of Foreign Affairs with the help of private firms sent out the magazines *France: Panorama*, *Chroniques de France*, and *Aux Frontières de l'Avenir* (on scientific subjects), while ORTF produced *Pour Vous*, *Madame* and a magazine devoted to literature. Most of these productions were also prepared for audiences speaking English, Spanish, Portuguese, and Arabic. *France: Panorama* was prepared in a Russian language version in addition to the other languages.

ORTF productions form the mainstay of the general program. Variety, documentary, dramatic, and musical programs are sent to French-speaking countries in the same versions as seen at home, while other countries receive dubbed or subtitled versions. A strong effort is made in the area of education. The *Service de la Radio-Télévision Scolaire* emphasizes the sciences.

The volume of programming is impressive: approximately 8,500 hours of film and television magazines a year; 5,783 of ORTF domestic productions in 1969; and, in terms of copies sent out, approximately 1,600 copies of educational programs sent to 69 countries in 1969.⁴

Estimating or speculating about the effectiveness of French television and film work is difficult. In the past few years governmental sensitivity seems to have increased in proportion to the increasingly important role France tries to play as a mediator between and manipulator of powerful opponents. In short, French reticence on the subject of program evaluation is at this time a fact of life.

THE DEVELOPING NATIONS

Films and television programs have been instruments for useful propaganda exchanges between the "have" and the "have-not" peoples. Cultural news has been the main ingredient in those exchanges, and this will continue. Unfortunately, cultural news is primarily one-sided, the "have" nations not learning much, if anything, about the people they communicate with.

However, some small insight as to foreign effectiveness with films is obtained from a limited recent survey (those interviewed were mainly young people considered to be potential technological change-agents), conducted in South America and Middle America. The results which follow (see Table) are in response to the question, "From what country or countries are the films which you see most?"⁵

TABLE—Foreign Film Reception in
Middle and South America

Source	Middle Americans (n = 119)	South Americans (n = 190)
United States	96	82
France	41	57
Italy	35	51
West Germany	26	12
Mexico	25	4
Great Britain	17	15
Eastern Europe	3	6
Spain	5	3
Argentina	4	3
Sweden	0	5
Japan	0.8	3
India	0	0.5

NOTE: The respondents in many cases named more than one country, which accounts for total of answers being larger than number of persons interviewed.

At the very least, provisions must be made for film and television propaganda to be mutual, if the general interest is to be served.

In a significant way, film and television propaganda constitutes schooling in development. Will it be effective? Perceptive students are skeptical. Here are a few reasons:

1. For a developing world torn by political difficulties, there is precious little use of films and television to warn emergent nations about the perils of repeating dreadful twentieth-century experiences of the advanced countries. The newsreels available from abroad have too little relevance to the local needs for news; much so-called news is documentary gloss and is lacking in truly educational information. It is a fact that "underlying causes of recurring crises are rarely explored . . . no account is given of what might be done to avoid or alleviate these crises."⁶ For both the developing and developed nations, there is a lack of adequate reporting about really serious problems like starvation and brutality. Coverage of the Biafran revolt or its aftermath in Nigeria, or about South African apartheid, are cases in point.⁷ . . . [One of the] savants produced by the American television industry, says "As journalists, we are not keeping pace with the realities; we report them but we do not truly understand them, so we do not really explain."⁸

2. Not enough study has been devoted to why development films fail to "contribute vitally to organic progress." We need more films of the type produced in the last decade by the National Film Board of Canada, such as *The Head Men* (which compares village chiefs in Brazil, Nigeria, and Canada), *You Don't Back Down* (a report of a two-year study by a young Canadian doctor in a village of Eastern Nigeria), and *The Stage to Three* (which contrasts leading theatrical personages of Greece, Thailand, and Canada).⁹

* * * * *

The developing nations are so caught up in rhetoric about communications technology that key Western leaders translate all worldly needs in terms of their own ambitions, and those ambitions by-pass objectives so necessary to progress in less developed countries. Propaganda becomes a mirror image of the developed West. Robert W. Sarnoff, chairman and president of the Radio Corporation of America, worries about the "social grasp" of communications and about communications satellites in particular. He warns that

If this new device is to realize its full potential, the nations of the world must come together to agree on matters of frequency, rates, copyrights, avoidance of interference, and freedom of access to the system's facilities.¹⁰

Such contemplation reveals all too dramatically the basic propaganda chasm of our times! The man in love with the idea of the machine is distinct from the man who desperately needs the ideas that are themselves the machines of progress.

DEVELOPMENT OF THE SOVIET PROPAGANDA LINE*

BY FREDERICK C. BARGHOORN

Soviet propaganda is not prevented by Communist ideology from adapting to changing international needs.

* * * * *

Since the [Communist Party of the Soviet Union] CPSU's "general line," formulated and reiterated with appropriate modifications in certain key statements, sets the ideological and semantic framework to which Soviet propaganda must conform, a survey of a series of these propaganda directives may furnish a background useful for understanding the major propaganda themes.

The communications examined have policy as well as propaganda aspects. It would be noted here that in Soviet political communication it is unusually difficult, and sometimes nearly impossible, to distinguish clearly between the elements of policy and propaganda. One can, of course, seek to infer policy from action. In reading Soviet mass media, however, it is difficult to separate analysis and directive, on the one hand, from demagoguery and even deception, on the other. A heavy component of propaganda is built into most published Soviet statements, especially those intended for distribution outside of a relatively narrow circle of heavily indoctrinated, experienced communist party insiders. The party leaders tend to view even most communists as objects of propaganda manipulation. Moreover, difficulties arise because they are impelled to resort to guarded, esoteric communication patterns that reflect both the influence of the elitist, conspiratorial political structure in which they operate and probably also the inadequacy of Marxist-Leninist terminology as a political language.¹

Of course, the student of Soviet political prose learns to distinguish between statements intended primarily as policy directives for party executives and propaganda specialists, for example, and agitational statement designed to play upon the emotions of rank and file communists and of non-communists. Thus, an analysis in a CPSU theoretical journal such as *Kommunist*, most of the readers of which belong to the Soviet political elite, of the "political essence" of the "national bourgeoisie" can be classified as primarily a policy document. Still, such an article may be permeated with propaganda connotations of a more or less covert nature. It may be intended, in part, to convey to Soviet and foreign communist functionaries instructions regarding tactics to be applied in dealing with, for example, Indian, Indonesian, or Brazilian "bourgeois" statesmen. By contrast, when Khrushchev openly and insist-

*Selections from "Development of the Propaganda Line" in Frederick C. Barghoorn, *Soviet Foreign Propaganda* (copyright © 1964 by Princeton University Press). Renumbering of footnotes. Reprinted by permission of Princeton University Press.

ently advocates "universal and complete disarmament" but dodges the issues of control and inspection, he is dispensing propaganda, but of course within the framework of the policy line controlling Soviet behavior in the given period.

Many Soviet statements, perhaps particularly those concerned with professed values and long-range goals, offer a rather confusing mixture of propaganda and policy content. Such a characterization would appear to be applicable to the statement taken from the 1961 CPSU program, and quoted by *Pravda*, for December 3, 1961 that "Communism fulfills the historic mission of rescuing all people from social inequality, from all forms of oppression and exploitation, from the horrors of war and establishes in the world peace, labor, freedom, equality, fraternity and the happiness of all peoples." Such a statement embodies both long-range policy and short-run agitational content. It also contains an element of myth and the reader's evaluation of it depends upon his fundamental political philosophy and his level of intellectual sophistication.

Understanding of Soviet propaganda strategy is facilitated by familiarity with certain kinds of statements, or indicators, such as the slogans issued by the party central committee in connection with the May Day and November 6 revolutionary holidays, or the documents emanating from congresses and other important meetings of the CPSU and the international communist movement. As a rule, the instructions, demands, and perspectives contained in slogans and other influence-seeking messages remain valid indicators of the Kremlin's outlook until they are altered or superseded by new communications that reflect new analyses and new decisions. Of course, these indicators have their imperfections. Even the leaders of various national communist parties often have difficulty in deciphering their full meaning for their particular situations. Nevertheless, acquaintance with those sequences of statements in which the semantically flexible but attitudinally rigid international policy line of Soviet Communism have been embodied over time is essential to an understanding of Soviet foreign propaganda. Let us begin with a survey of the international implications of Soviet slogans.

A systematic analysis by Lasswell and Yakobson of trends in Soviet May Day slogans for the period 1918-1943 yielded significant results.² The central finding of the study, which covered a period, it should be noted, when Moscow was usually on the defensive, was a pronounced diminution in "universal-revolutionary" symbols.³ This was attributed to "changed expectations regarding the imminence of world revolution, and the resulting change in the relationship of the ruling elite to the world balance of power."⁴ During the dangerous year 1940 even the term "international proletariat" disappeared from the May Day slogans. It was in that year that the threat of "imperialist encirclement" seemed to the Soviet leaders to become more acute than ever before. In 1940 and again in the early months of 1941, the slogans reflected a desire "not to affect

adversely, by any hasty or unfriendly word, the established understanding with Berlin.”⁵

In 1942, during the first year of the Soviet-Nazi war, the slogans called upon the “proletarians” of all countries to fight against German-fascist aggression. The Nazis were referred to as “Hitlerite imperialist bandits,” an expression calculated to mobilize both traditional Russian patriotic hatred of an invading enemy and the newer “Soviet patriotism” based upon devotion to Marxist-Leninist ideology and upon identification with Soviet institutions and achievements. The 1942 slogans significantly failed even to mention the Communist International. Its name was thus dropped well in advance of its official liquidation in 1943—“either by reason of obsolescence or in an effort to appease the new democratic allies.”⁶ Beginning in 1943, such words as “proletariat” and “proletarian” were no longer used in the slogans. From that year on, the slogans themselves began to be referred to as “appeals.” The 1942 and 1943 slogans contained cautiously friendly references to Great Britain and the United States.

In the late 1920’s and in the 1930’s, a theme gradually emerged which is vital in Khrushchevian propaganda, and which like so many of Khrushchev’s propaganda lines owed its inception to initiatives taken by Stalin. This theme was the superiority of the Soviet model for industrialization of a previously backward society, and it took on increasing significance during the period of the great depression in the west, in the early 1930’s. By 1939, the slogans declared that the “immediate task” facing the Soviet people was that of “overtaking and surpassing” the economically progressive capitalist countries.⁷ Even at this early stage, “the Soviet economy was ambitious to lead the world.”⁸ Of course, the introduction of the industrialization motif did not distract attention from urgent concerns connected with the difficulty of surviving in what Moscow correctly appraised as an exceedingly threatening world situation. The slogans, reflecting the bitter struggle of the Soviet leadership against external enemies and their real or fancied internal supporters, were dominated by warnings of impending dangers.

From the perspective of our times, however, it is significant that these slogans contained so many expressions of confidence about the future world role of the Soviet Union and of the communist movement in general. Despite the lesser prominence in the slogans and other contemporary communications of the general theme of “world revolution,” this objective was, of course, not repudiated. For example, the famous “Short Course” on the history of the CPSU, published in 1938, stated in its introduction that the study of the history of the CPSU inspired confidence in the final victory of communism in the whole world.

World War II, while setting the stage for the second great period of expansion of world communism, also temporarily weakened the Soviet Union. In this complex and contradictory situation the Kremlin seized and, in the aftermath of the war, consolidated its control of as much

territory as it could in eastern Europe and in Asia. Reflecting alarm at Western resistance to Soviet expansion, the slogans, beginning in 1947, denounced the "warmongers" of the west. The May Day slogans, 1947-1952 inclusive, placed toward the beginning of the list such exhortations as "Workers of all countries: Struggle for a firm peace against the warmongers!"⁹

These slogans reflected Kremlin strategy in the period of military-political consolidation of the gains resulting from World War II.

May Day and November 6 slogans from 1953 on suggested only the broad outlines of the new world-wide propaganda strategy. Nevertheless, they furnished clues both to Soviet estimates of developing susceptibilities in various audiences and to the capability of the USSR to take advantage of them. In particular, they reflected Khrushchev's decision, from 1955 on, to exploit anti-western sentiments in Asia, Africa, and Latin America.

The most striking over-all difference between the post-Stalin slogans and those of the late Stalin period was the reappearance and growing frequency of "internationalist" symbols. This trend was signaled by the May Day slogans in 1953 which were issued about six weeks after the death of Stalin. The very first slogan contained the exhortation, "Raise higher the banner of proletarian internationalism!"¹⁰ In every subsequent year following the death of Stalin this exhortation was repeated. Until 1962 it was contained either in the first slogan or in one of the first three, sometimes as part of one of the slogans and sometimes as a separate slogan. However, in 1962, it dropped to seventh place in the listing, perhaps reflecting a certain disillusionment in Moscow with the results of cultivating the foreign "Internationalist" audience—though the clue may be too minor a one to serve as a basis for interpretation.

It is possible to distinguish between two kinds of "internationalism" in Soviet propaganda since Stalin. There is the traditional kind of communist internationalism, which is directed toward some group assumed to be favorable to the USSR—such as "peace partisans" or "workers"—or which revives such symbols of international communism as "proletarian internationalism." There is also a "great power" internationalism, in which the Soviet Union or other great powers appeal to world audiences without regard to class or ideological considerations. The relative weight of both of these kinds of international or "foreign" appeals increased in Soviet slogans and in the total Soviet propaganda output after the death of Stalin. The increase in slogans with "ideological internationalist" connotations was particularly pronounced after 1957. This type of appeal was, however, played down in 1955, the year of the "Geneva spirit" and the high point of the post-Stalin campaign for "relaxation of international tensions."

An analysis of Soviet slogans since Stalin's death revealed trends of interest for the study of Soviet foreign propaganda.¹¹ There was a substantial rise in the percentage of attention devoted to "foreign" as against

"domestic" problems. The total number of slogans and especially the number devoted to foreign countries increased. The slogans reflected the fact that Soviet concern with and attention to the external world increasingly flowed outward from the Soviet-Chinese heartland into areas to which previously little attention had been given. The area of Soviet attention broadened to include more and more countries in the "neutralist" world.

* * * * *

The slogans issued to the world by the CPSU following Stalin's death indicated a revival of confidence that the forces of world social revolution were once again on the move, especially in the underdeveloped countries. At the same time, they also reflected acute awareness in the Kremlin of the enormous dangers involved in the confrontation of Soviet bloc and western military power. Finally, unlike those issued during the first few years of the bolshevik regime, the post-Stalin slogans suggested that the leaders of world communism regarded Soviet state power rather than the international proletariat as the chief instrument for remaking the world.

It will now be useful to briefly survey and compare the vitally significant and revealing communiques issued by the two world communist summit meetings of 1957 and 1960. The 1957 document was endorsed by the CPSU and eleven other ruling "communist and workers' parties." The 1960 document was subscribed to by eighty-one communist parties.¹² In essence, both of the communiques heralded a revival of the international communist movement particularly with reference to the underdeveloped countries. With the internal situation in the Soviet bloc once again under tight control late in 1957, the Soviet and other communist leaders apparently felt that the time was ripe for the resumption of the international propaganda and psychological warfare offensive. The very beginning of the 1957 communique asserted that the "fundamental content of our epoch" was the "transition from capitalism to socialism, begun by the Great October Socialist Revolution in Russia." It went on to assert that the most important consequence of the increase in the influence of the "forces of socialism" was that it had "stimulated the rapid extension of the anti-imperialist national liberation movement in the post-war period." It listed various countries that had "shaken off the colonial yoke and established national independent states." It hailed the struggle of the peoples of "the colonial and dependent countries" for "national liberation."

Both communiques depicted the capitalist countries as fighting to preserve a deteriorating position of world power. The 1960 communique, officially entitled Statement of the Conference of Representatives of Communist and Workers' Parties, referred to the contemporary historical period as a time of "socialist revolutions . . . nationalist revolutions . . . a time of the breakdown of imperialism . . . the abolition of colonialism . . . of transition of more peoples to socialism and communism on a world-wide scale." Both communiques described the world socialist

movement and the "national liberation movement" as natural allies in a bitter struggle to destroy capitalism. Both presented the "socialist camp" as the only possible model for economic and social development. Both also branded the United States as the leading exponent of reactionary policies and portrayed that country as the leader of a monopolistic, capitalist-imperialist bloc.

The two communiques both set forth similar strategical concepts. One was that of the non-inevitability of war between the capitalist and socialist blocs and the other was the doctrine of the "anti-imperialist" coalition. Both communiques expressed the conviction that the victory of socialism could be achieved without an all-out war. Such a war would be unprofitable for socialism. It was, however, necessary to keep socialist military strength stronger than that of the adversary in order to discourage a resort to war by the capitalist bloc. Perhaps because of the Chinese challenge to the thesis of the non-evitability of all-out war, the 1960 communique dealt at much greater length than that of 1957 with the problem of peaceful coexistence. The 1960 communique held that peaceful coexistence was "the only correct and reasonable principle of international relations" and that this policy was "an ally of socialism." It certainly did not, however, imply a cessation of the class struggle or any reconciliation of socialist and bourgeois ideologies. On the contrary, it demanded an intensification of "the struggle for the triumph of socialist ideas."

With regard to the "anti-imperialist coalition," the 1960 communique defined it as "the world socialist movement, the international working class, the national liberation movement, and the countries opposing war, and all peace-loving forces."

The language of the two communiques indicated that the leaders of the international communist movement were confident that the socialist bloc could win the adherence of all the underdeveloped countries of Asia, Africa and Latin America to their general line of policy and leadership. In addition, they counted on gaining the support of neutral countries and of all factions in the western world that were opposed to war and to the use of nuclear weapons. Finally, they could rely on foreign communist parties to facilitate their efforts. By marshaling these political and social forces they expected to bring about, systematically and rapidly, the progressive isolation of the western democracies from any influence outside the North American continent and western Europe.

In keeping with this strategic analysis, the two communiques contained directives for propaganda tactics. They urged the defense of "peace." The 1960 communique demanded "an end to nuclear testing in the arms race, of foreign bases, foreign occupation, the disbanding of all military blocs, a peace treaty with Germany, the demilitarization of Berlin, and the prevention of the revival of militarism in Germany and Japan."

Secondly, the communist parties were urged to fight in defense of the "national and democratic interests" of the peoples of all countries. The 1960 communique was more radical, however, than the 1957 communique

with respect to the "national liberation struggle." It foresaw as the immediate objective of this struggle the establishment of the "independent national-democratic state," or "national democracy."

The 1960 communique defined an independent national-democratic state as: "A state that consistently defends its political and economic independence, struggles against imperialism and its military blocs, against military bases on its territory; a state that struggles against new forms of colonialism and the penetration of imperialist capital; a state in which the people are assured broad democratic rights and freedoms (freedom of speech, press, assembly, demonstrations, and establishment of political parties and political organizations) and the opportunity to work for agrarian reform and the satisfaction of other demands in the sphere of democratic and social transformations and for participation in the determination of state policy."¹³

It would seem, then, that a central criterion for the establishment of "national democracy" is the elimination of "imperialist," or in other words western economic, political and cultural influence. Further characteristics of the national-democratic state also appear from the above definition to include nationalization of the major sectors of the economy, a radical program of agrarian reforms, and freedom of action for the local communist party. It is expected that the national-democratic state will be established through the unification of all "progressive" forces "vitally interested in abolishing the domination of the monopolies," these forces being the working class, peasantry, intelligentsia, and urban, petty, and middle bourgeoisie.¹⁴ It seems clear from the 1960 communique and from the resolutions of the Twenty-second Congress of the CPSU that the stage of "national democracy" is regarded as one of preparation for the transition to socialism. This is evident from the 1960 communique, which stated that: "The participation in the struggle for democratic transformations by the broad strata of the population convinces them of the necessity of unity of action with the working class and helps to increase their political activeness . . . In the process of this struggle they continually strengthen their ties with the masses, raise the level of the masses' political consciousness and bring them to understand the tasks of socialist revolution and the necessity of achieving it. . . . Marxists-Leninists are firmly convinced that the peoples of the capitalist countries will in the course of their day to day struggle come to understand that socialism alone is the real way out for them."¹⁵

Soviet foreign policy and foreign propaganda efforts continue to be linked to the objective of fostering and accelerating world-wide social revolution. And, as we pointed out in the preceding chapter, Khrushchev and other Soviet leaders continue to urge adherence to another Leninist policy, namely, that of making maximum possible use for communist purposes of temporary class allies such as the "national bourgeoisie" or various other non-proletarian strata and groups. The communists, of course, reserve to themselves the right of defining these groups and of

deciding when they cease to be useful and should be attacked or destroyed. However, while recommending cooperation with non-proletarian and non-Marxist groups and organizations whenever it is expedient, the 1960 communique and other current Soviet documents make it clear that the communists are prepared to resort to violence, or at least to threaten its use, to prevent the loss of any gains that may have accrued to them as a result of their exploitation of the national liberation movement and other contemporary social forces. In this connection it is significant that the 1960 communique also declared that it was the duty of all communists to oppose the "export of counter-revolution." This doctrine has assumed a particularly ominous significance since 1961 in connection with the Cuban problem and Khrushchev's ambiguous but nevertheless threatening statements that United States military action against the Castro government would mean war.

The main lines of the 1960 communiqué were reiterated in Khrushchev's speech of January 5, 1961, to a gathering of Soviet communists in Moscow, entitled, significantly, "For New Victories of the World Communist Movement," as well as the 1961 program of the CPSU. For example, the program indicated that although there could be differences in the "forms and tempo" of social revolution, revolution remained the only means and the dictatorship of the proletariat (declared by the program to be superseded inside the Soviet Union by the "state of the entire people") the inevitable outcome of the struggle still underway in the non-communist world.¹⁶

The above doctrines, reflected in Soviet strategy *vis-à-vis* such countries as Guinea, Laos, and Cuba, indicated Khrushchev's determination to achieve Leninist aspirations for world revolution even in the conditions of the nuclear age. Among many ominous manifestations of the post-Stalin rededication to the export of violent revolution, certain little-noticed Korean developments are worth mentioning. The Fourth Congress of the North Korean Workers (Communist) Party, in September 1961, called for establishment in South Korea of a "revolutionary Marxist-Leninist party," to fight against U.S. "imperialist occupation," and carry out an "anti-imperialist" program.

Secretary of State Dean Rusk in an address on July 10, 1961 noted that in Soviet policy, "the very language of international intercourse became distorted and contrived." "Peace" had, he observed, become a word to describe whatever condition would promote the communist world revolution. "Aggression" was whatever stood in the way of this revolution. He thus reminded the world of a communist practice, first applied on a global scale in the mid-1930's, of employing traditional symbols of democracy and liberalism for communist purposes. Of course, such terms as peace, negotiation, freedom, democracy, progress, etc., mean different things to communists than to western democrats, liberals, and non-communist socialists. The importance of what Lindley Fraser in his excellent study *Propaganda* called "double-talk" is that very often the

non-communist targets of the use of these terms by communists are not fully aware or perhaps not aware at all that, for example as Fraser puts it, "world peace will be for the first time achieved when the world as a whole is converted to communism." ¹⁷

The doctrines, directives, and messages which we have surveyed reflect the dominant and persisting influence exercised in Soviet propaganda strategy by what Brzezinski calls the "dichotomic" Soviet vision of the nature of international politics. The data examined would appear to support Brzezinski's contention that the Soviet international outlook has been shaped by "the notion that social developments throughout the world operate on the basis of a sharply definable dichotomy—a dichotomy that is proof per se of an unbridgeable hostility between the emerging socialist state (later a system of socialist states) and the rest of the world."¹⁸

But, as we have also observed, the dichotomic orientation permits and indeed requires the exercise of strategic and tactical flexibility. It is probably true, as Robert C. Tucker impressively but perhaps a little too forcefully argued in 1957 in his article "The Psychology of Soviet Foreign Policy," that Stalin in the last few years of his life was so obsessed with physical control over territory and people that he was, in contrast to his successors, unable to employ propaganda effectively as an instrument of foreign policy.¹⁹ While there is much truth in such an interpretation of Soviet policy during the late Stalin era, it tends to exaggerate the differences between the policies of Stalin and those of his successors. During the last three years of Stalin's lifetime some essential elements of the strategy which has paid considerable political dividends to Khrushchev were worked out at least in preliminary form. The truth may be that Stalin, or some of his lieutenants, perceived the need for more flexibility in Soviet foreign policy and for a more persuasive manner of presenting it. But it is possible that the dictator was temperamentally incapable of adjusting fully to the challenges and opportunities which the emerging international constellation offered for the extension of Soviet influence.

Nevertheless, as Marshall D. Shulman has convincingly argued, Stalin adopted, in 1949–1952, a policy designed to disintegrate the unity and mobilization achieved by the western powers in their efforts to counter the Berlin blockade, communist aggression in Korea and other communist actions. Stalin turned to "the use of nationalism, the peace issue, neutralism, trade, and other forms of collaboration with elements of the bourgeoisie."²⁰ Among the major propaganda operations in which the Soviet policy shift after 1949 were reflected, the Moscow International Economic Conference of April 1952, and a stepped-up "peace" campaign were perhaps the most conspicuous. Although with less enthusiasm and skill than Khrushchev was later to display, Stalin nevertheless attempted to convince foreign businessmen that it was profitable to trade with communist Russia. Shulman compares the late Stalin "right-wing policy" with other temporary Soviet retreats, succeeded, as was that of 1949–

1952, by renewed advances. He arrives at an interpretation which may seem reassuring because it differs from theories that emphasize neurotic compulsions in the personality of leaders as driving forces in Soviet policy, but should also serve as a warning against underestimating the effectiveness of that policy. Shulman sees in Soviet policy—and this writer agrees with his finding—a “largely rational responsiveness to changes in the world environment, particularly to changes in world power relationships.” What may be an irrationally intense urge for power is associated with sensitivity to many dimensions of social and political reality, including some often neglected by non-communists, and with a formidable, coordinated program to shape the future of mankind in conformity with the Marxist-Leninist vision. If to these strengths one adds the energy displayed by Soviet communicators, and the resourcefulness they so clearly possess, it becomes possible to better understand the magnitude of the challenge posed by their urgent and persistent appeals to world audiences.

NOTES

¹ Aspects of the “exoteric-esoteric” dichotomy in Soviet political communication have been perceptively analyzed by Almond, *op. cit.*, especially in chap. 3, and by Nathan Leites, in *A Study of Bolshevism* (Glencoe, Ill., 1953); see also Myron Rush, *The Rise of Khrushchev* (Washington, D.C., 1958) and Robert Conquest, *Power and Policy in the U.S.S.R.* (New York, 1961). Rush and Conquest are concerned primarily with Soviet domestic politics but their techniques of analysis have relevance also for the study of Soviet foreign policy statements.

PROPAGANDA FOR THE PLA SOVIET ATTEMPTS TO SUBVERT THE RED CHINESE ARMY*

BY RICHARD H. GIZA

An account of a two-year propaganda campaign using radio broadcasts to exploit tensions within the military forces of another country. In a conflict between ideological kinship and national interests the latter will win.

The withdrawal of Soviet military advisors and aid from Communist China in 1960 halted the modernization of the Chinese armed forces—the People's Liberation Army (PLA). Already in the late fifties, a debate was underway in China's military circles between professionals favoring an independent role for the military and the Maoists who advocated stronger party controls over the army.¹

The Soviet Union, seeking to exacerbate tensions between the opposing military lines in China, began a sophisticated propaganda campaign in early 1967 using radio broadcasts, especially designed and beamed to PLA listeners, to play upon the discontent within the armed forces. The tenor of these broadcasts makes it quite clear that the Soviets are attempting to subvert the PLA.

PLA WEAKNESSES

While the PLA with its approximately two and one-half million men is the only nationally effective, comparatively unified body in China, it has weaknesses. It is divided by regional alliances, personal loyalties, and political, as well as professional, aspirations. It is, however, the only organ with sufficient power to challenge the Maoist regime. Now that the PLA is playing a role in practically all aspects of Chinese society, its loyalty is a vital factor in the Great Proleterian Cultural Revolution and the future of China.

The Chinese *Liberation Army Daily* admitted that a struggle existed between the "proletarian revolutionary line" represented by Mao Tse-tung and the "bourgeois reactionary line" in the PLA. It urged that troops be loyal to Mao and that they eliminate his opponents "who have wormed their way into the PLA."²

*From *Military Review*, XLIX, no. 9 (September 1969), pp. 89-95.

The Soviet Union probably decided sometime in 1966 to take advantage of the growing opposition to Mao in military circles and openly intervene in the cultural revolution. Moscow no doubt felt that the area was fertile for exploitation and that there was not too much risk involved on her part. The beginning of the Soviet attempt to subvert the Maoist leadership and provoke discontent within the PLA was signaled by an editorial in the 29 December 1966 issue of *Red Star*, the Soviet daily military newspaper, entitled "Events in the Chinese People's Republic and the People's Liberation Army of China."³

ANTI-SOVIET CAMPAIGN

The article begins with a commentary on the anti-Soviet campaign currently being waged in China and praises the PLA as representatives of the working class and true revolutionaries. It further states that the Maoist leadership is attempting to make the army a blind weapon for implementing its anti-Marxist-Leninist, anti-Soviet course. On purges, it stresses that those purged:

... were experienced military leaders and Communists who tried to base and strengthen the combat capability of the PLA with a consideration for national peculiarities and revolutionary traditions.⁴

Having purged the army of all those disagreeing with Mao's politico-military theoretical concepts, the article accuses the Maoists of attempting to strengthen the army's role in the nation's political life and make it a bastion for Mao's ambitions. The article closes recalling the history of friendship between the PLA and the Soviet Army and expressing the hope that they will march together again united.

The Radio Moscow phase of the campaign to turn members of the PLA against Mao's military thought began slowly in 1967 and picked up momentum toward the end of the year. In February 1968, the Soviets sharply escalated the attack by increasing their half-hour programs to PLA listeners from three broadcasts a week to daily programing with each broadcast repeated four times per day.⁵

The general format of a "Program for the PLA" usually consists of a commentary by a military officer. He holds the rank of colonel or above and in many instances is identified as a former Soviet advisor to the PLA. Frequently, the previous warm ties of friendship between the PLA and the Soviet Army are recalled before the commentator attacks various Maoist policies said to be harming the armed forces. The program usually closes with a summary of the main theme and the hope that the PLA will overcome the grave obstacles put before it and become united once again with the Socialist camp.

The propaganda effort by Radio Moscow toward the PLA is based on six basic themes: a general attack on Maoist military doctrine, combat weakness and training, the cultural revolution and the army, the purge, the use of the PLA for nonmilitary purposes, and the recall of historical ties between the PLA and the Soviet Union. It is evident that the aim of

these programs is to cause a breakdown in the morale of the PLA which could lead to an open revolt against the Maoists.

The following is a typical Soviet attack on Maoist military doctrine:

Mao's theory is basically erroneous, negative and defensive and points to defeatism. Mao proposes retreat and defensive maneuvers; giving the soil to the enemy. What was thought to be correct during the period of guerrilla war cannot be made the basis of present day combat maneuvers.

The broadcast closes with the following appeal:

We know the PLA is an army which has spirit, patriotism and love for the fatherland. It will not be a silent and pliable tool in the hands of Mao.

On guerrilla warfare, Radio Moscow exhorts:

Mao's guerrilla war thesis is not only a mistake of a man who has no knowledge of military affairs but an ideological attack aimed at shattering the Chinese people's belief in the Soviet Union's advanced military science.

COMBAT DEFECTS

The broadcasts which probably have the greatest impact on professional soldiers are those which attack combat weakness in the PLA. This weakness is attributed to the lack of modern weapons and realistic training.

In a program for the PLA entitled "Fatal Effects of Mao Tse-tung's Military Thought on the Development of the Chinese PLA" on 14 July 1968, the Soviets played on their favorite theme with this quote from V. I. Lenin.

The ones who win the upper hand in war are those equipped with the best technological weapons, good discipline and behavior. . . . war tactics depend on the level of military technological equipment. . . . the finest army will be instantly mopped up by the enemy if it does not have the necessary arms, supplies and training.

The program concluded: "There are no planes or tanks in the PLA and the lack of spare parts makes useless those given by the Soviet Union."

Radio Moscow often quotes official Chinese Communist sources and then attacks the statement. In January 1968, it quoted a *People's Daily* statement that "the best weapon is Mao's thought as far as the Revolutionary Army in the contemporary era is concerned." The broadcast then charged that no PLA fighter can seriously accept this view and that planes and weapons are necessary for victory—not Mao's thought.

RHETORICAL QUESTION

The Soviets often use the rhetorical question to make their point. The query "Why does Mao's propaganda deny the importance of modern weapons in warfare?" is answered: "To have weapons you must first have a strong economy. The cultural revolution has dislocated the economy so that new equipment for the PLA is out of the question."

Individuals such as Lo Jui-ch'ing, former Chief of Staff of the PLA, are used as propaganda vehicles. One program stressed that Lo's purge was

due to his suggestion that weapons play an important role in modern warfare and his insistence on the modernization of the army instead of following the thought of Mao.

The Soviets boast of their assistance to other countries. One program detailed the modern equipment and training the Soviet Union was providing to the North Vietnamese Army. The idea apparently is to make the PLA jealous of the North Vietnamese Army and indignant at Chinese leaders for the poor relations with the Soviets.

Ridicule is sometimes injected into the campaign. The New China News Agency is quoted in one program as announcing that a U-2 spy aircraft was shot down while the Chinese air commander used Mao's quotes. The Soviets say this is laughable and that all Chinese people know that the victory was achieved not through quotes, but through the use of Soviet MiG aircraft.

No doubt the ultimate insult was a broadcast statement that the PLA was even inferior to Chiang Kai-shek's troops in technology and equipment.⁶

Maoist policy on military training stresses learning through actual combat. Moscow criticizes this policy as leading to great bloodshed at the hands of green leaders and points out that poorly trained troops cannot compete against modern armies. Mao is accused of betraying resolutions adopted at the 8th Party Congress which called for modern training for PLA cadres, for the PLA to master the skills possessed by Soviet troops, and for the PLA to guard the Socialist camp with the Soviet Union.

The Soviets set up the military school system in China, and many Chinese officers were trained in the Soviet Union. In the late fifties, the Maoists launched a campaign to deemphasize Soviet methods and doctrine. Today, Moscow broadcasts use ridicule to promote distrust of the present school system as a means for military preparedness. Commenting on a Chinese article announcing the establishment of an academy for training navy minesweeper personnel, a Soviet program had this to say:

The major subjects in the curriculum are class struggle and the struggle between the two roads. . . . Mao claims there was not a single qualified military academy prior to the Cultural Revolution. Training of two to three years is too long involving too much book work . . . only one month is needed to train a good pilot. . . . An army which loudly recites Mao's slogans does indeed only need a couple of months of training.

The Soviets devote the largest percentage of programming to the cultural revolution and its effect on the PLA. They charge that opposition exists within the army and that Mao needs the army for the cultural revolution to succeed. In discussing an editorial in a PLA organ, which advises the army to keep away from factional conflicts, a Soviet broadcast concludes that this testifies to disturbances and disorder within the army and the factional conflict between supporters and opponents of Mao.⁷

In two programs in 1968 dealing with the opposition problem, Moscow claimed that 12 military corps do not support Mao, that Mao's policy in splitting this once closely knit group (the PLA) is contrary to China's

national interest, and that Mao is afraid of the PLA. The only answer for Mao is to split the army and sow discord.

PURGE STATISTICS

When a nation is in turmoil, the purge is no doubt the most feared consequence for those in power. Six programs for PLA listeners in 1968 were directly concerned with purges, and many other broadcasts alluded to them.

Statistics are frequently employed in exploiting this theme as indicated in an October 1968 broadcast:

Ninety percent of the CCP [Chinese Communist Party] military affairs committee in the last two years were expelled. . . as well as sixty top level PLA commanders.

Probably the best ploy used by Radio Moscow is the threat that the purge will be extended to the lower levels of the PLA. For example:

Mao Tse-tung does not limit his purge to high-ranking commanders, but has decided to expand the purge to reach the middle and low ranking commanders, such as commanders of regiments, battalions, and companies.

SECRET POLICE

The Soviets also promote suspicion in the ranks of the PLA by referring to a secret police organization set up within it by Mao. The claim is stressed that any one can be arrested and units can be discarded at any time by the secret police.

The opposing military line in China has frequently complained that government use of the armed forces for nonmilitary purposes was detrimental to morale and combat preparedness. This theme is exploited by broadcasts which claim that the use of the PLA in propaganda efforts to spread Mao's thoughts and in military police work to put down clashes by the Red Guards detracts from its combat readiness and mastery of weapons. Radio Moscow calls on the PLA to refuse these tasks and not be manipulated.

For consumption by the Chinese civil populace, the Soviets claim "the army is everywhere having assumed the roles of police, judges, workers, executioners, peasants, and schoolteachers." To further opposition to the PLA and promote discontent among minority groups in China, broadcasts are directed to these people in their dialect. The aim is to unite the minority groups against the army and possibly provoke open opposition.

Stress is also placed on the deterioration of the PLA since the break with the Soviet Union. Weakness in the PLA is said to be due to the absence of cooperation with the Soviet Union, and this is Mao's fault. In contrast, the Warsaw Pact is held up as a symbol of unity and strength.

The PLA is asked in another broadcast why Mao attempts to incite hatred within the army for the Soviet Union. Moscow answers the question by stating that it does not matter what Mao attempts since Soviet and Chinese troops know the real value of combat friendship.

These programs stress the "good old days" and contrast them with the turmoil of the present day. There always appears to be the hint lurking in the background that conditions would improve if Soviet aid were provided.

This two-year propaganda campaign by the Soviet Union to subvert the PLA began to taper off in late 1968, and, by the end of the year, it had virtually stopped. The Soviets may have felt that they had exhausted the subject or that the campaign was not accomplishing the results desired and quite possibly that it was becoming counterproductive.

POLITICAL WARFARE—QUALIFIED APPLICATION* **

BY MONTE R. BULLARD

The political warfare concept has been used as a system to promote governmental legitimacy and to develop supportive political attitudes within the military forces, as well as to close the gap between the military services and the civilian populace. A political warfare doctrine to be transferable must recognize and be able to adapt to the underlying traditions of the society to which the transfer is attempted.

The importance of political warfare in countering wars of "national liberation" is evident in the increasing discussion of the political side of warfare. Asians, as well as Americans, are conscious of the need to place more emphasis on the political. As a result, Asians have begun to review Asian sociopolitical experience in the hope of finding a model which fits Asian problems more precisely than the Western approach which stresses military technology.

One model which is considered quite successful by Asians is that of the Republic of China (ROC). It is considered successful because it seems to have reached an appropriate compromise between sociopolitical and technological considerations. The Republic of Vietnam was the first to adopt the Chinese system.

* * * * *

SUPPLEMENT OR SUBVERT?

When certain conditions exist in a developing nation, the ROC political warfare model can be a valuable institution. Even when the conditions are appropriate, however, the ROC model must be modified before it is applicable to other nations.

* * * * *

The ROC model, in the eyes of the Vietnamese, seemed to fit the cultural patterns, history, and character of the people more closely than the U.S. military solutions for insurgency. It seemed to counter the threat of covert rather than overt aggression better than U.S. doctrine and tactics.

The principal political consideration concerns the length of time an incumbent government has been in power. A good government which has been in power for a long period may have proved itself by satisfying the demands of the people, thereby gaining their support. In other words, legitimacy has been established.

POLITICAL ATTITUDES

New governments, however, have not yet established legitimacy. They cannot assume that the people will grant automatically their wholehearted support. The government which has just gained power must rely on a political socialization process to teach the people their new role in society. It must create political attitudes which will support it until it has shown that it can satisfy the demands of the people better than the insurgents. It must devise some active means of creating supportive attitudes without the use of coercion since, in the long run, coercion would weaken the government.

The political warfare concept was the tool selected by the Chinese to accomplish this task in the aftermath of the 1911 Chinese Revolution. The Chinese abandoned the political warfare concept during World War II, however, because Western advisors believed it counterproductive.

When the Republic of China withdrew to Taiwan in 1949, it began an intensive review of the causes of its defeat. Many well-trained and well-equipped military units would have proved proficient, but there was a key weakness—loyalty. Outstanding units, trained by Western advisors, following Western military doctrine, were useless, or even dangerous, when they decided to change sides in the middle of the civil war. The Chinese recognized that internal strife generated unique military problems which did not exist in wars between nations. Thus, they concluded that a political warfare system was mandatory to promote governmental legitimacy and develop supportive political attitudes within the military forces.

LOYALTY CONCEPT

Beyond the idea of creating support for the government, the concept of loyalty in Asia should also be considered. There is little tradition in Asia of loyalty to a nation or ideology. More important has been loyalty to an

individual or family. The leaders of China had the monumental task of transferring this loyalty from an individual or family to a nation or ideology. The political warfare system was a vehicle for this transfer.

China had no tradition of democracy with its emphasis on individual rights and dignity. Even under the political system as outlined by Sun Yat-sen in the "Three Peoples Principles," the individual was to be subordinated to the needs of the state. It was true that the people, the masses, came first in everything, political or economic, but the term people always referred to the people as a whole, a collective term, and not people as individuals. When this concept is combined with the authoritarian tradition, the concept of standing up for one's individual rights is lost. As a result, a type of passive submission to authority existed among the people, especially in the army.

If a company commander took advantage of his position to maltreat one of his soldiers or even the civilians in his area of jurisdiction, traditionally there was no recourse for the mistreated individual. The power of the commander was too great.

One possible influence on the commander was his education. If he were well read and understood the humanitarian principles of Confucius, he might be a benevolent leader, and there would be fewer problems. The majority of commanders, however, were not so well educated.

Often, economic temptations were great. The pay of officers, as well as that of soldiers in China, has always been low in comparison with other elements of society. Fringe benefits found in Western armies were lacking. There was no one to look after the moral or economic welfare of the troops.

ECONOMIC GAIN

Consequently, the unit commander, who received only a nominal pay, certainly not enough to support a family, began to take advantage of his position for economic gain. If he were given money to buy food for his troops, he embezzled a portion of it. If he had the opportunity, he confiscated some of the produce of local civilians in the name of the army and the revolution. But the soldiers sent to confiscate the local rice saw an opportunity for themselves. They confiscated more than the commander asked for and kept the difference for themselves. Corruption was even worse at the higher levels.

There was traditionally a deep-rooted enmity between civilians and soldiers in China. For centuries, the armies of China have maltreated, robbed, and abused the peasant. This is reflected in the old Chinese saying, "One does not use good steel to make nails nor does one use good men to make soldiers."

The political warfare concept was designed by Chinese leaders to close the gap between commanders and soldiers and between the military services and the civilian populace.

FAMILY RELATIONSHIPS

One important reason for the quick acceptance of the political warfare concept into China concerns basic family relationships. Traditionally, family authority and responsibility are vested in the eldest member. He is responsible for the livelihood and protection of the family members. In order to make this system function, strict rules govern individual behavior and discipline, and all members of the family are expected to comply with the wishes of the group leader, the oldest living relative.

As a result of this relationship, the individual derives a strong sense of security. He knows he can depend on his family to help him solve his personal problems, especially those with people outside the family group.

When an Asian youth is taken from the relative security of his family group, he experiences much more of a traumatic shock than his Western counterpart. He is completely lost when he finds that he must accept the full responsibility for his own actions and has no one to provide him guidance and support. The political warfare concept provided a solution for this problem. When the concept is carried out as it is intended, the military unit replaces the family, the political warfare officer provides assistance in solving personal problems, and the commander represents parental and supreme authority.

The concept of the military commander and the political warfare cadre acting *in loco parentis* is communicated to soldiers by means of military magazines, radio, and television, usually in the form of fictional stories which dramatize the role of the unit political warfare officer.

The role of the unit political warfare officer goes beyond serving *in loco parentis*. He is responsible for personalizing relationships within a unit. His goal is to make the unit into the soldiers' new primary group—that is, a surrogate family. The assumption is that, if the military unit becomes a *de facto* primary group, favorable patterns of behavior can be stimulated more easily, and new values can be formulated. The Chinese recognized the political warfare system as a possible solution for remolding attitudes and forming new values which could transfer the loyalty of soldiers from their real family to their new military family and beyond that to the nation.

A second sociological reason for the ready acceptance of the political warfare concept is directly related to the first. Personal relationships at the lowest level are virtually codified. Custom dictates how one individual deals with another. There are acceptable and unacceptable actions which can be taken. When a conflict between two persons arises, the means of resolving it is especially limited by the "code" of conduct. Conflict cannot be solved by direct confrontation. The traditional Asian way to resolve conflict between two individuals has been to use a go-between.

The problem of direct confrontation is especially difficult in the military hierarchy where the commander of a unit must maintain a special image. As a result, if a soldier has a grievance which might reflect adversely on

the capabilities of the unit commander, he must not seek redress because the commander cannot recognize the fact that something is wrong in his own unit. Consequently, the provision had to be made to resolve problems which were caused by the commander's actions.

MEDIATOR ROLE

It was necessary that no culpability be attributed to the commander who must be made to appear the champion of his troops, striving to protect them from grievances brought about by "the faults of the time." The only means to achieve this, yet bring bona fide problems to the attention of the commander, was through a mediator. Political warfare officers serve this purpose—grievances can be aired before the commander without attacking his dignity.

These were some of the considerations which caused China and Vietnam to accept the political warfare concept. Even if we allow, however, that the political warfare concept is a useful tool for situations like Vietnam, there are still some qualifications which must be introduced if an undesired concentration of power is to be avoided. Political warfare doctrine should:

- Be taught as a model only where political and social conditions are appropriate.
- Come from the majority voice of a representative national congress.
- Include political, sociological, economic, psychological, and military principles which reflect national goals.
- Be transmitted through command channels and be a command responsibility..
- Prohibit direct connection between political warfare cadres and political parties or special government organs. Political warfare cadres should have no special channels of communication to the outside (party or higher level political warfare cadres).
- Include the fact that the political warfare cadre's role is to support the commander and not to watch over his activities.
- State that political warfare cadres are subordinate to unit commanders. Unit commanders must have courts-martial jurisdiction, influence on promotions and assignments, and generally unsubverted command authority over the political warfare cadre.
- Provide that the political warfare cadre should rotate in and out of political warfare jobs. Political warfare should not become a career specialty.
- Emphasize the welfare, educational and recreational aspects of political warfare.

Organizationally, counterintelligence should not be included as a political warfare function.

The Republic of Vietnam has studied the ROC model in detail,

and has integrated some of the points mentioned. The South Vietnamese have taken from the Chinese model that which they believe is consistent with conditions in the Republic of Vietnam. They have rejected portions of the Chinese model which are not suited to Vietnamese national goals.

The Republic of China's political warfare model has much to offer nations struggling to achieve stability and independence. It is worthy of continued study to seek solutions to problems which are peculiar to emerging nations. Most important is to recognize the ROC model, not as a panacea, but as a partial solution to insurgency problems when those problems are caused by conditions similar to the Chinese experience.

CHINA IN AFRICA*

By G. T. Yu

The effect of persuasive communications is greater when the source is perceived by the audience to be similar or in similar circumstances.

CHINESE-AFRICAN INTERACTION

Chinese-African interaction represents an excellent example of China's international participatory role. Over a decade has elapsed since China first appeared on the African scene. During this period, Africa increasingly assumed an important place in Chinese foreign policy. An intensive drive to win friends and gain influence ensued. Although the campaign has suffered serious reversals, China's presence continues to be evident in Africa. In 1969 thirteen African States continued to recognize China, while Chinese influence among the African liberation movements was also dominant.

* * * * *

To date, the major thrust of China's interaction with Africa occurred during the years 1960 to 1965. Two dominant factors explain the wide level of Chinese activities. First, between January 1, 1960, and December 31, 1965, no fewer than twenty-nine African colonies won independence; consequently, these years represent also the peak of China's diplomatic offensive and other activities in Africa.

* * * * *

Secondly, with the increased level of the Sino-Soviet conflict beginning in the 1960s, China sought to openly challenge Soviet diplomatic influence and subvert Soviet revolutionary credibility internationally. Africa,

*Excerpts from "China in Africa," *The Yearbook of World Affairs*, 1970, Stevens and Sons, London, 1970. Reprinted with the permission of Stevens and Sons, publishers, copyright holder.

therefore, assumed the role of a battlefield in the Sino-Soviet conflict. Chinese activities in Africa directed toward the subversion of Soviet influence and credibility took many forms, including the campaign to identify the Soviet Union as a "European" State and the attempt to link Soviet policies with "United States imperialism."

* * * * *

1965 dates the beginning of the . . . present period of Chinese-African interaction. This period has been characterised by a reduction in the overt formal presence of China on the African continent and the initiation of a "selective" Chinese foreign policy toward Africa. Within China, this period coincided with the Great Proletarian Cultural Revolution; and except for Angola, Mozambique and a few other colonies this has been the post-independence era in Africa. Without question, this had been a period of Chinese retreat. . . . Really meaningful interaction with China involved less than six States, including the Congo (Brazzaville), Guinea, Tanzania and Zambia. Thus toward the end of 1969, China's policy toward Africa had changed from one of indiscriminately seeking to win recognition from and establish diplomatic relations with most of the African States in the early and mid-1960s to a policy of selective interaction with a limited number of African States.

* * * * *

CHINA'S AFRICAN POLICY: OBJECTIVES

Since the late 1950s with the passing of the colonial empires and the emergence of the independent African States, Africa has served an important function in the foreign policy of China. While for reasons of security, and other immediate factors, Asia represents the area of primary national interest, China has perceived Africa as second only in importance. Three primary objectives can be suggested for the importance of Africa to China. Anti-imperialism has constituted a major theme in the foreign policy of China. . . . The 1965 statement by Lin Piao calling upon the "world countryside" of Asia, Africa and Latin America to surround and capture the "world cities" of North America and Western Europe can be accepted as a Chinese variation of the classical Marxist-Leninist thesis.¹

* * * * *

If anti-imperialism constitutes a primary policy objective, the campaign to challenge and subvert the international status of the Soviet Union has become equally important to China. . . . A Chinese objective, therefore, has been to identify the Soviet Union with "United States imperialism" and to discredit the Soviet Union as a revolutionary force. . . .

A final Chinese objective has been the constantly reiterated theme: African-Asian-Latin American solidarity.

INSTRUMENTS OF CHINESE FOREIGN POLICY

China has conducted an aggressive campaign in Africa to achieve its

policy objectives, utilising a vast variety of foreign policy instruments, formal and informal. In the formal category, China has put great emphasis upon inter-State relations and has sought to win recognition by, and exchange diplomatic missions with, most of the African States.

* * * * *

To give substance to the relationship with the African States, China has been quick to employ additional formal foreign policy instruments. These have been expressed chiefly in the form of a variety of agreements. Generally speaking, they fall within four categories. First, there have been the more traditional alliance type of agreements, expressed in the form of friendship treaties. These treaties have always been based upon the Five Principles of Bandung, intended to promote solidarity between the two parties, and contained the provision "to develop economic and cultural relations in the spirit of equality, mutual benefit and friendly cooperation." . . . Cultural pacts represent a second type of agreement utilised by the Chinese. Such agreements usually call for the exchange of students, educators, newspaper reports, theatrical groups, and other activities in the cultural domain. . . .

* * * * *

Finally, there are the economic aid and technical assistance agreements. As an instrument of foreign policy designed to give substance to Chinese-African interaction, this formal instrument has been most important. The hunger and need for funds, the lack of technical know-how and human resources, and the great desire to engage in developmental work to attain political and, moreover, economic independence, have made the African States highly receptive to foreign assistance.

* * * * *

Concurrent with the utilisation of formal foreign policy instruments, China has made extensive use also of informal instruments. A study of statecraft has pointed to the importance of informal foreign policy instruments.² Basically, such instruments seek to bring into direct contact a State's representatives and opinions with the people and/or processes of another country, in an effort to achieve specific policy objectives. The emphasis here is upon face-to-face interaction as opposed to the formal State-to-State relationship. A major assumption is that by utilising informal instruments a State may better solidify friendship (or increase the level of conflict) with other States. Within the context of Chinese-African interaction, a degree of face-to-face contact has evolved through China's use of informal foreign policy instruments.

China's use of informal instruments includes a wide variety of techniques, overt and covert, violent and non-violent. (It is important to note that many of the informal techniques are made possible through prior formal access; *e.g.*, film agreements concluded between states make possible the showing of motion pictures to the general public.) Among the overt, non-violent techniques of informal access has been the exchange programme. This has brought Africans from various social levels and

professions to China and has sent delegations of one sort or another from China to Africa. Until the advent of the Great Proletarian Cultural Revolution, an increasing number of Africans and Chinese had visited each other's country. During the month of September 1964, *e.g.*, no less than twenty-five separate reports on Africans in China were announced, ranging from an art delegation from Mali, a youth league from Zanzibar, to a music scholar from Morocco; in the same month, a Chinese youth delegation was visiting several central African states while a trade union mission was in Algeria. Whatever the type of delegation and whoever the individuals, the exchange programme has without doubt done much to introduce China to the Africans.

China has made extensive use of the communication media to reach the African population. Since 1956, radio broadcasts have been utilised with increasing frequency. Beginning with only seven hours per week in English, China in 1969 was broadcasting to Africa over 100 hours per week in English, French, Hausa, Portuguese, Swahili, and Cantonese and Mandarin Chinese. Radio Peking's programmes have consisted of combinations of news and commentary, strongly ideological in nature, with intervals of recorded music. Another important media has been motion pictures. China has exported to Africa full-length films, short films and newsreels; Chinese film weeks have been held in several African cities. Modern Chinese theatre groups have also toured Africa.

China has relied also upon the printed word to reach the African populace. There are now English, French and Spanish editions of the weekly *Peking Review* for Africa. Where sale and distribution have been permitted, the *China Pictorial*, *Quotation from Chairman Mao Tse-tung*, Mao's selected military writings, and other Chinese offerings, have been readily obtainable. Other communication media include the New China News Agency, which freely distributes news of China to the Africans. In discussing the communication media, one must be intellectually aware that the measurement of flows is not necessarily a measure of their impact. Nevertheless, China's intensive use of the communication media, whatever the impact, cannot be denied.

Direct, face-to-face interaction between the representatives of one State and the populace of another constitutes another type of informal foreign policy instrument. Such personal contacts, it has been maintained, allow the representatives of one State to enjoy the maximum level of interaction with and impact on the populace of another State.

Within this context, the dispatching of Chinese experts to assist African individuals and groups in specific fields of knowledge (together with the training of select Africans in China) must also be considered. No doubt through such personal interaction, China has sought to influence a segment of the African population. Chinese technical assistance to Africa has included experts on tea planting and soil analysis in Morocco, rice growing and military training in Tanzania and Uganda, and building construction in Guinea. To date, the impact of the face-to-face interaction

via the presence of Chinese experts in Africa has been less as a consequence of personal interaction than through perceived exemplary Chinese behaviour patterns. Chinese experts in Africa, have largely refrained from establishing close social contact either with their African counterparts at work or with Africans generally. Personal interaction, therefore, has been minimal. Where the Chinese experts have made an impact has been in their collective and individual hard work and frugality, which has been cited by the indigenous leadership as behavioural patterns to be followed. In Tanzania, where over a thousand Chinese experts were residing in 1969, the face-to-face interaction between the Chinese experts and the indigenous population has followed this pattern.³

Participation in regional and functional international organisations constitutes yet another level of Chinese-African interaction. As an informal instrument of foreign policy, membership and participation in various international organisations have permitted China to gain access to both the representatives and processes of the African States. China's past and present role in the Afro-Asian People's Solidarity Organisation, the Afro-Asian Conferences, the Afro-Asian Journalists Association and other organisations represent examples of the great use of this informal instrument.⁴

China has been equally active in the use of covert informal foreign policy instruments. Unlike overt instruments which can readily be observed, covert operations are hidden and therefore difficult to measure. The great secrecy surrounding such activities have [sic] sometimes led to a majority of the covert operations being attributed to Chinese influence, thereby giving the Chinese a far greater role in Africa than they in fact enjoy. This is not to deny the use of covert instruments by China. Chinese "illegal" arms and money, and methods in unconventional warfare have been uncovered in a sufficient number of instances to lend support to certain charges. For example, Chinese assistance to the Angolan, Mozambique and other African liberation movements has not been without total foundation. In short, we can correctly assume that China has made free use of covert informal foreign policy instruments. The question, however, is not the utilisation of covert instruments. Rather it is the extent of Chinese covert instruments, and China's perceptions pertaining to the use of covert instruments in relation to its use of overt instruments of foreign policy.

Fundamentally, China perceives no conflict between its concurrent use of overt and covert informal instruments of foreign policy. The two instruments have been seen as complementary. Thus, China has not hesitated to employ—or threaten to employ—revolution as an instrument of foreign policy, while utilising overt instruments in its relations with the African States and territories.

Taking into account all foreign policy instruments, formal and informal, overt and covert—and positing that the extent of one State's interest in another's can be measured in terms of the degree and depth of utilisation

of such instruments—the African States have occupied an important role in China's foreign policy. Similarly, the concentrated employment of a vast variety of foreign policy instruments toward Africa constitutes a measure of China's international participatory role.

Southeast Asia

BETTER UNDERSTANDING OF THE ROLE OF NEWSREELS AND DOCUMENTARIES IN THE NEW SITUATION*

BY PHAN TRONG QUANG

In the face of aerial bombardment of their territory, the North Vietnamese concerned themselves with elementary and psychological impulses rather than with abstract ideological arguments. The effects of the air strikes were clearly depicted in order to reinforce domestic resolve and evoke international sympathy.

For nearly two years now, in the face of the situation of the American imperialists intensifying their war of aggression in South Vietnam and launching a war of destruction against North Vietnam, the Vietnamese documentary and newsreel films branch, rather than declining, has developed vigorously. In addition to the Vietnamese newsreel and documentary shops, we have additional Vietnamese People's Army film shops. Newreels, documentaries and science films have all increased over 1964. The process of making a film and getting it to the masses has been shortened. The number of films issued at home and sent abroad has tripled.

By way of instruction, the science films have made great efforts in guiding intensive cultivation to increased productivity of plants, in introducing production experiences from areas where there is continuous fighting, in actively contributing to stepping up the technological revolution in agriculture, and in teaching military, air-defense and first aid common sense.

By way of mirroring real people, real things and real scenery, the newsreel and documentary films have positively contributed to convicting the American imperialists and to singing the praises of our army and people. Although there have not yet been many films of the type that

*Excerpts from a translation of an article by Phan Trong Quang in the Vietnamese-language periodical *Hoc Tap* (Studies), No. 1, Hanoi, January 1967, pages 72-79. JPRS, listed in the monthly *Catalog of U.S. Government Publications*.

denounce enemy crimes, these films have become tombstones of hate and resentment through the pictures recording the barbarous crimes of the American invading army in its deliberate destruction of market places, schools, temples and churches and especially of our hospitals. The film of the Quynh Lap Leprosy Camp, destroyed by the American pirates, is, before international opinion, a fitting slap in the mouth of Johnson, the robber who both kills people and recites his prayer of "humane peace." The cruel character of the American imperialists was unmasked through their insane act of bombing the sick people receiving treatment there. The American bombs and bullets only brought to the surface the great and humane efforts of the public health workers of our country on the road to conquering Hansen's germ and to defeating the U.S. imperialists. The realism of the film is a reflection of the ardent revolutionary sentiment of the people who made the film. Only by really hating and resenting the enemy and only by really loving our system and our people could the film makers show these real pictures and be able to have such an effect. Teaching and creating hatred, resentment and despising of the enemy and building up the determination of our people to annihilate the enemy is a science and it is one of the important tasks of our culture and art.

* * * * *

We have recorded beautiful pictures which easily reflect the incomparable bravery and the will of the army and people of North Vietnam to defeat the enemy's war of destruction. In the rain of enemy bombs and storm of enemy bullets our patrol boats still fiercely strike back at the enemy planes; the air defense fighters still aim directly at the enemy and fire; the militia women still bravely fight and help down U.S. jet planes; the workers still climb up tall electrical poles to join a wire; the Suot women still bravely row the ferryboat to serve the troops. . . . By bringing to the movie screen these very "real" and very "alive" scenes, the newsreels and documentaries have tried to prove in a concrete and active way the great revolutionary heroism of our army and people. One type of news reportage films about the front line provinces of the old Region Four has been welcomed by the people because of the new pictures in the first period of combat. A number of films after that learned how to penetrate an individual, a thing and a scene and condition in combat. Through the scenes of our soldiers placing their guns on the corpses of the French tanks at Dien Bien Phu and of our army and people joining together to pull artillery up high hills in order to fire on U.S. airplanes, the film *Tay Bac Attacks The Americans* showed the people the relationship between the previous resistance against France and the present resistance against the United States and, in so doing, consolidated their trust in the anti-American national salvation task. The film *Fighting To Protect The Native Island*, is like a picture poem singing the praises of the spirit of combat unity of the army and people of Bach Long Vi. From the first arrival of troops on the island to the time when the troops help the militia in military training and coordinate in rhythmic combat against

the American aircraft one sees a process of development, not only of incidents, but also of people. The film *Brave Con Co* showed moving shots of the life of combat on a small and brave island of the fatherland through the eyes and feelings of a soldier guarding the island. It can be said that the film is a diary splashed with feeling. Alongside the hours and minutes of fierce fighting against enemy planes and warships, our soldiers still occasionally relax and lie with their legs crossed, whistling; still sometimes mischievously splash water on one another while bathing; or right in the middle of the fighting trench enjoy the boiled crab of the cook. Their bravery is as great as their spontaneity, initiative and optimism; it is an unusually simple kind of bravery, combining in a lively way the essence of the new revolution and the traditional national traits of the Vietnamese people.

* * * * *

Together with the precious films of the National Front for the Liberation of South Vietnam, the newsreels and documentaries in North Vietnam have effectively contributed to teaching the line and policy of the Party and Government, to stimulating the revolutionary heroism and will to win, to stimulating the people to stretch up into the front ranks, both producing and fighting and mastering science and technology. The newsreels and documentaries have been received by the masses with no less enthusiasm than for a feature film. Not only is the percentage of showings distinctly higher than before but the average number of viewers per showing is higher for newsreels and documentaries than for features. The tendency to treat newsreels and documentaries lightly and purely business thinking in the showing of films have begun to be overcome. It can be said that we have begun to carry out the instructions of late 1964 of Prime Minister Dong defining the present requirements for film production as "principally not feature films but newsreels and documentaries."

* * * * *

The aforementioned record in producing and issuing newsreels and documentaries is a noteworthy victory on the ideological and cultural front. It has contributed to the defeat of the schemes of the Americans in using bombs, bullets and psychological warfare in the hope of shaking the determination to liberate South Vietnam and of blocking every anti-American-national salvation action of our people. It proves that in the war against the United States newsreels and documentaries have increasingly become powerful ideological weapons and more and more are the indispensable spiritual food of our people. From this we can affirm that the more the anti-American-national salvation work progresses and the fiercer the struggle becomes, the more abundant and the more powerful the newsreels and documentaries will become; and, regardless of the situation, the production, issuing and elevation in quality of the documentaries and newsreels will still continue to develop.

* * * * *

Among our ideological tools, newsreels and documentaries are able to

reflect these real people, real things and real scenes in the most faithful, lively and timely way. The film *Anh Nguyen Van Troi Song Mai* (Nguyen Van Troi Lives Tomorrow) has greatly contributed to the work of mobilizing among our people a seething movement to imitate hero Nguyen Van Troi. It has been warmly received by foreign opinion chiefly because it has been able to introduce a hero who is proud and indomitable before the enemy troops during the last minutes and seconds of his life. When we saw Troi's picture in the newspapers we were able to concretely perceive a part of the truth. When we saw his image on a screen it was like seeing the entire truth about the historic nine minutes of his life. Real people and really brave things which have a political significance and effect, once selected for filming into documentaries or newsreels, take on more and more of a political character and are increasingly effective in directly serving politics. Lenin clearly pointed that the nature of newsreels and documentaries is reason and politics visualized, that the spirit of the film must comport with the proletarian press line and that the people who make the films and documentaries must become Bolshevik reporters with movie cameras in hand.

In reflecting real people, real things and real scene in the anti-American-national salvation task in order to stimulate, teach and organize our people to defeat the American aggressors, newsreels and documentaries perform the duty of a Party newspaper using images. As Party newspapers using images, the newsreels and documentaries must really correctly and really promptly reflect the line, policy and viewpoint of the Party through the reality of the masses who are striving to properly execute every directive and resolution of the Party in a self-aware manner. And, like a Party newspaper, newsreels and documentaries must assure timeliness, a mass quality, a combat quality, a liveliness and, most of all, truthfulness.

The principal value of newsreels and documentaries is the value of truth in life. Our people need to see newsreels and documentaries chiefly because they want to see the images of their native villages and their people and activities at the present time in order to take pride, be encouraged and be determined to vanquish the American invaders. Our people trust in the newsreels and documentaries and, consequently, we cannot allow one detail of the film to be able to sow suspicion in the viewer. In addition to the films which have unnatural smiles and smiles in the wrong places, there are a number of films which have a great many images of one hand on the plough and one hand on a gun, one hand on a hammer and one hand on a gun, and one hand on the fishing net and one hand on a gun; these have a forced quality. Tendencies to rearrange everything according to the subjective desires of the person making the film are also pretty prevalent. Even in some of the good combat films we still see details lacking in genuineness. No embellishment, no matter how "artistic" has any place in newsreels and documentaries, because newsreels and documentaries are only to reflect real people and real things.

Even in cases where we must reluctantly film a re-creation of the truth, the newsreels and documentaries still must assure the truthfulness and trustworthiness of the images represented and not permit the viewer to see the "hand" of the producer in it.

Every genuine image has truth; but every truthful image does not have genuineness. The image of mother Suot rowing the ferryboat to serve combat has been praised by viewers as genuine not just because it contains truth but, chiefly, because it has revealed the heroic but normal quality of a mother, in particular, and of our people in general. The genuineness discussed here is the genuineness representing the essence and law of matter in the process of its development, meaning genuineness in accordance with the point of view of Marxism-Leninism.

PSYCHOLOGICAL OPERATIONS IN LAOS*

BY THE 7TH PSYOP GROUP

A summary overview of the psychological operations program of the contending sides in Laos, the Royal Lao Government and the Pathet Lao.

Both the [Royal Laotian Government] RLG and the [Pathet Lao] PL have a variety of psychological operations (PSYOP) programs designed to reach various target groups within Lao society. PL themes are directed at the youth, ethnic minorities, religious leaders, and RLG troops. PL themes claim corruption and graft in the established government and are aimed at the youth and various ethnic groups. The PL direct the "war-monger" theme to all sections of the society. Along with this is an anti-U.S. propaganda program, designed for RLG troops. It stresses the righteousness of PL programs and calls for the RLG troops to defect to the "rightful" side.

To carry out their objectives the PL use radio, propaganda teams, motion pictures and printed media, including leaflets and a newspaper called the *Lao Hak Sat*. Four radio stations broadcast in support of the PL: *Radio Peking*, *Radio Pathet Lao*, *Radio of the Patriotic Neutralist Forces*, and *Liberation Radio* (Vietnam). Most of these programs are in Lao to Laos but the Pathet Lao send reports in English for international audiences via teletype.

In an effort to persuade rather than to force, the RLG carries out its own PSYOP programs. RLG themes are addressed to the entire country as well as to special audiences of Government officials, Lao-Thai, merchants and commercial circles, military forces, the PL, farmers, other ethnic groups, monks and the youth.

The PSYOP objectives of the RLG are to reduce the combat efficiency of the enemy to mold favorable attitudes toward the war effort, to stress the goodwill of the U.S. to confuse the enemy concerning ideology and the

*From "PSYOP Intelligence Special Report," Issue SR 1-72, 7 February 1972, pp. 1-15-1-16.

aims of leaders, to convince enemy troops to defect, and to carry out plans for economic and other development while educating the people.

To carry out these goals the Government uses posters, leaflets, motion pictures, still pictures, cartoons, traveling theater groups, FAR PSYOP teams, loudspeaker programs, radio broadcasts, and printed media.

The RLG has radio stations at Savannakhet, Pakse, Luang Prabang, Chimaimo, and Vientiane which transmit to an estimated 70,000 radio receivers in the country.

Since most of the people are illiterate, radio and loudspeaker programs are the most effective from the standpoint of reaching numbers of people. The cartoons, plays, and to lesser extent, leaflets are well received. Probably the most effective program is that of FAR country teams who travel throughout the country informally talking to villagers.

The Lao publish *Khao Phap Pacham Sapda*, a weekly news and photo sheet that has a circulation of approximately 20,000 and reaches the largest number of literate people in the country; this pictorial newspaper is valuable because its format is very effective in appealing to the uneducated villagers.

Since PSYOP effectiveness is always difficult to assess, the Ministry of Information, Propaganda, and Tourism is responsible along with military units for assessment. Recently, the value of leaflets was shown when large numbers of PL defectors stated that leaflets and loudspeaker programs were influential in their decision to desert. During the conflict in Indochina, PSYOP will be important.

Most Lao leaders are quick to recognize the importance of PSYOP to them even if the situation does not always allow necessary materials and support for thorough programs.

Pacific

INFORMATION AND CULTURAL AFFAIRS*

BY THE NEW ZEALAND DEPARTMENT OF EXTERNAL AFFAIRS

Government information must be clear, well written, and adapted to the audience. Official information activity must be carried out with reference to policy objectives and national interest.

* * * * *

In the past five years, following the somewhat belated recognition of the support which information activity must give to foreign policy, several important steps have been taken to shape and extend New Zealand's information efforts overseas. A Cabinet Committee has been established to provide co-ordination and guidance. An information unit has been set up within the Tourist and Publicity Department to produce material specifically designed for distribution overseas. Procedures have been worked out for regular co-operation and consultation in Wellington among the five most interested Departments—Treasury, the State Services Commis-

*Excerpts from *Annual Report of the Department of External Affairs* (New Zealand), 1 April 1966 to 31 March 1967, pp. 67-69.

sion, the Departments of External Affairs, Industries and Commerce, and Tourist and Publicity. A special annual appropriation for overseas information work has been provided. And deliberate efforts have been made in a number of ways to expand and improve overseas information activities within the broad policy objectives which have been set.

Particular attention was paid during [1966-1967] to projects for the adaptation and translation of information publications and film soundtracks for different regions; and priority was accorded material in vernacular languages for the new posts which were opened in Bonn and Rome. The basic booklet *Facts and Figures* is now printed in French, Italian, German, and Japanese, with Malay, Mandarin, and Thai versions soon to be available. The publication *New Zealand* has been completed in French, Japanese, and Thai, with Malay and Mandarin editions also planned. Selected articles in the New Zealand *Fact Sheets* series have been printed in all these languages, and also in Samoan and Indonesian. A set of the *Fact Sheets* in Dutch is in preparation. Finally, a number of background articles and a tourist brochure are also being translated and printed in most of these languages.

As the overseas information service has enlarged its scope, it has become apparent that continuing expansion in the range of publications and other resources, coupled with the growing experience of those concerned, make possible new and valuable opportunities to give factual details about New Zealand and to supplement its policies. At the same time, the increasing complexity of conducting sustained and successful information programmes has brought new problems.

For programmes to be effective, and equal to new opportunities as they arise, certain requirements are essential. The information service must be equipped with a comprehensive range of materials to enable it to present a true picture of New Zealand in all its aspects; there must also be close co-operation and co-ordination of efforts among the various Departments concerned in Wellington, and between the Department of External Affairs and overseas posts. At this early stage there are, obviously, some areas in which improvements in liaison are required. There is a need also for continual vigilance against differences of interpretation on basic policy features of the overseas information programme and for constant reference, in every publicity venture, to the accepted basic principles which govern information activities abroad.

If the increased production of basic information material in foreign languages is the year's most important advance, there have been several other useful achievements. Particular efforts have been made to take advantage of occasions which, of themselves, have directed attention of New Zealand. The distribution by posts to local newspaper editors and broadcasting stations of the New Zealand Day Press Kits, comprising feature articles and photographs on aspects of New Zealand, is an obvious example of the opportunities for valuable publicity which exist from time to time concerning New Zealand in overseas capitals. The visits to New Zealand during the year of President Johnson and Vice-President Hum-

phrey of the United States and the Prime Ministers of Australia and South Vietnam, aroused considerable interest abroad and led to heavy demands on our posts in many countries for information on New Zealand and its national and international policies. Kits of background material were provided to the groups of journalists accompanying the visiting parties. From all these differing operations one lesson has emerged clearly, namely, that the greater the number of audiences which New Zealand seeks to interest in itself, the more varied and sensitive must be the information which it provides.

The overseas programme exchange service of the New Zealand Broadcasting Corporation, which was established in 1965, has rapidly expanded its distribution of transcribed radio programmes to stations in the Pacific and throughout Asia. It has thus provided a valuable supplement to the Department's own efforts in the day-to-day activity of overseas posts. The Department has also given encouragement to New Zealand participation in international cultural exhibitions. Particularly pleasing results were achieved through the exhibition of Katherine Mansfield manuscripts, photographs, publications, and personal articles in Paris, London, New York, Baltimore, and Ottawa. This exhibition involved the posts concerned in a considerable amount of administrative effort, but the reward in the audiences gained and the consequent appreciation of New Zealand cultural achievements, has fully justified a sustained and complicated operation. Planning is now proceeding for the tour in the Pacific and Asia of an exhibition of paintings of contemporary Maori artists and Maori artifacts.

An active programme of visits by influential persons from countries of importance to New Zealand, was fulfilled under the Overseas Visitors Fund.

* * * * *

The Department will continue . . . to work in close association with the Overseas Information Section of the Tourist and Publicity Department to maintain and improve the effectiveness of New Zealand's information activities abroad. It will continue to emphasize the futility of information activity that lacks purpose and is pursued without regard to policy objectives and the national interest. It will stress, too, the need for information material that is clear, well written, and both in content and language, fully adapted to the audience.

Africa

SOUTH AFRICAN PROPAGANDA: METHODS AND MEDIA*

BY VERNON MCKAY

No country perceives itself as an international pariah, even if other states so treat it. The political communications of such a state tend to focus on the few highly specific audiences where the messages may have some impact.

. . . . For two decades, South Africa has been the target of worldwide

*Excerpts from "South African Propaganda: Methods and Media," *Africa Report*, February 1966, pp. 41-46. Reprinted with the permission of *Africa Report*, copyright holder.

criticism, some of it fair and some unfair. To respond to its critics, the Republic has mobilized a many-sided counterattack through the films, periodicals, and booklets of its Information Service, through employment of American public relations firms, and through publicizing the views of certain Americans who express strong sympathy for white South Africa and eulogize it as a fine field for American investors.

. . . . The Cabinet Ministers who portray South Africa as a stable, prosperous Western ally in contrast to a chaotic and savage black Africa infected with Communism are striking a responsive chord. . . . The ultimate objective is to change U.S. Government policy toward Africa.

NEW CONFIDENCE IN PRETORIA

To understand the current expansion of South Africa's information program, one must relate it to the political factors that account for the aura of confidence now emanating from Pretoria. . . . South Africans are encouraged both by their success in repressing African nationalist movements, sabotage, and terrorism, and by the hope that the threat of economic sanctions against them is receding.

* * * * *

The government's view that diversionary turbulence elsewhere will ease pressure on South Africa had repeatedly been confirmed, however, by the crises over Berlin, Cuba, the Congo, Malaysia, the Dominican Republic, the Middle East, and India's conflicts with China and Pakistan. These crises bolstered the view that Europe, Latin America, and Asia were higher than Africa in United States foreign policy priorities, and that the American armed forces, heavily committed in Vietnam and elsewhere, would regard the idea of a naval blockade of South Africa with great disfavor.

"OPEN SEASON ON UNCLE SAM"

Pretoria's new confidence was reflected during the next few months by the introduction of further stringent security legislation in April and June and by Dr. Verwoerd's declaration of "open season on Uncle Sam," as a South African newspaper termed it (*Daily Dispatch*, July 21, 1975). In May [1965], when the American aircraft carrier *Independence* wanted to refuel in Cape Town enroute to the Seventh Fleet in the Pacific, the South African Government took the position that only white flight crews from the carrier could land at the Republic's airports. The United States responded on May 13 by cancelling the carrier's visit to Cape Town.

This was followed, on June 25, by Prime Minister Verwoerd's statement at a Nationalist Party meeting at De Aar that the United States would not be allowed to post Negroes at its two space tracking stations in South Africa. Since the United States had not sent any American Negroes to the stations, Verwoerd's statement was gratuitous and provocative. NASA responded three days later by stating that the United States planned to continue operating its tracking stations, using personnel assigned without regard to race and color. The issue also got to the White

House, where Press Secretary Bill D. Moyers reaffirmed on July 16 that the United States would assign personnel abroad regardless of color. In response to questions from the press, however, Moyers refused to say whether the United States would close the South African stations in case of a showdown.

At the De Aar political rally on June 25, according to *The New York Times*, Dr. Verwoerd also bitterly attacked the multiracial guest list of invitees to the American Ambassador's annual Fourth of July party, and declared that South African officials would continue to boycott mixed receptions. Since this was the third year in which the Ambassador had invited people of all races, Dr. Verwoerd's statement again seemed deliberately provocative.

On August 30, the *Rand Daily Mail* carried a story saying that the Government of South Africa had demanded three cuts in the USIA film entitled *John F. Kennedy, Years of Lightning, Days of Drums*, because of scenes of U.S. Peace Corps volunteers working with Africans in Tanganyika, Negroes and whites working together in the United States, and scenes of the civil rights program. USIA refused to show a cut version of the film.

This was followed on September 21 by the Prime Minister's statement at the Orange Free State Nationalist Party Congress in Bloemfontein regarding his tangle with the United States Government over the activities of four American diplomats. It was true, he said, that these United States representatives had conducted themselves in a manner which his government did not regard as being in the interest of friendly relations between the two countries. He denied, however, the reports in the American press that South Africa had asked the United States to withdraw these diplomats. To repudiate reports that he had been rebuffed by the United States, the Prime Minister stressed that there was no question of a rebuff because he had only informed the United States of the behavior of its representatives, leaving it to the State Department to deal with the matter.

Two days later the American Embassy in Pretoria announced that the United States had decided not to withdraw the four "senior and experienced" diplomats. The statement reaffirmed full confidence in the officers, and the "conviction that they had performed their duties in accordance with normal and accepted practice for the conduct of diplomatic representatives." The Afrikaans newspaper, *Die Vaderland*, stated that the four Americans were "active in leftist politics," and it hinted that the government was displeased at reports that they were associated with the South African Institute of Race Relations. The paper also contended that the US Embassy had distributed films praising people who opposed the South African Government's policy and had issued "frankly propagandistic" materials on the civil rights issue in the United States.

* * * * *

Whatever Dr. Verwoerd's motives, it should not be overlooked that his attacks on American policy unintentionally helped the United States, at

least temporarily, by improving its image in the minds of Africans and other critics of apartheid.

THE INFORMATION DEPARTMENT

* * * * *

When the Nationalist government came to power in 1948, it decided to reorganize the Office and concentrate on an expanded information program abroad. Overseas information officers formerly under the Department of External Affairs were transferred to the State Information Office under the Department of the Interior. A Cabinet decision gave the Office director and his staff access to all Ministers and department heads, and the Office worked out a system of cooperation with other departments and with such government organizations as the South African Tourist Corporation, which advertises the Union's scenic attractions.

While the Office also serves South Africans at home, "by far" its "most important function," according to its first annual report in 1949, "is to serve as a channel for the distribution of information on South Africa abroad." When Dr. D. F. Malan became Prime Minister in 1948, there were only three information branches overseas—one in London since 1939, a second in New York since 1942, and a third in Nairobi since 1943. The Nationalist government increased the number of information attaches and assistants to 16 in 1949. Officers were assigned to Paris, The Hague, Rome, Bonn, Lisbon, Ottawa, Buenos Aires, and Leopoldville, and plans were made to send one to Salisbury. The Office announced the optimistic intention to have an information attache in every country with which the Union had diplomatic relations.

* * * * *

The major program of the Office soon developed in the United States. According to its 1951 annual report ". . . the South African Government Information Office in the U.S. is in fact serving two States, the U.S. and the vast organization of the United Nations with its exceptional potentialities for spreading news and influencing world opinion." In 1951 the Union decided to set up an office in Washington in addition to the office operating in New York since 1942.

The 1952 annual report also suggested that the "West Coast offers an important and approachable field for South African publicity," although it was December 1963 before an office was finally opened in San Francisco. Above all, the 1952 report stressed the significance of New York which, "apart from being the biggest center of news dissemination in America, if not in the world, also has in its midst the elaborate press organization attached to the United Nations," with representatives of about 400 world newspapers, news agencies, and radio services accredited to the UN all the year around, and more than 1,000 accredited pressmen there during the General Assembly. The Office concentrates on lobbying of these newsmen in order to maintain the best possible relations with them: "This is undoubtedly the most important aspect of public relations activities in the UN."

By 1955, after J. G. Strijdom had replaced Dr. Malan as Prime Minis-

ter, the stage was set for still further expansion of information activities. The State Information Office was transferred back from the Ministry of the Interior to the Ministry of External Affairs, then headed by Eric Louw. At this time, Louw also held the key post of Minister of Finance and was willing and able to provide more money for overseas propaganda. Partly because of its policy decision to refuse to cooperate in United Nations discussions of South Africa's racial problems, the government was convinced of the necessity for greater publicity overseas through its own channels.

A change in tone in South Africa's attitude toward world opinion is clear in the first of 107 "Fact Papers" which began to appear in 1955 as supplements to the Information Office's weekly *Digest of South African Affairs*. Written by P. J. Meiring, Director of State Information, it appeared in December 1955 under the title "World Opinion—does it matter?" Meiring warned his countrymen that those who are indifferent to world opinion "have arrived at a dangerous state of mind" because "the possibility of isolation and ostracism is more than South Africa would like to endure or care to afford." He concluded his four page plea with these words:

Modern techniques have turned selling into a highly specialized science. South Africa could profitably employ these new-fangled methods in her difficult task of "selling" herself to the outside market. The real commodity that wants selling, however, is good will and the real story that wants telling is the unofficial, domestic and social story of what individual White South Africans are doing for the Bantu. Let that be a story of real understanding and willingness to uplift and it will be a story to impress and convince the outside world.

In addition to the problem of persuading the South African public, Meiring was having difficulty at this time in convincing Cabinet Ministers that they should be more careful in their speeches to constituents at local political rallies in order to avoid unnecessarily adverse reactions overseas. *The Star* (Johannesburg), in several critical articles during this period, called on the Information Office to publicize "facts" rather than political speeches. Meiring evidently had some success with Prime Minister Strijdom, partly by trying to convince him that the growth of President Eisenhower's popularity in the United States was the result of good press relations.

Another tactic of South Africa's propagandists is the use of American public relations firms. In 1955, when Meiring was considering offers from four American public relations organizations, he concluded that this was an effective way of selling Belgian policy in the Congo to American audiences, but doubted that American firms would have "enough sympathy and understanding for South African problems" to be good press agents for the Union. Five years later, however, the South African Government decided to employ . . . a New York firm, to help sell South Africa to the American public, mainly through films.

THE FULBRIGHT INVESTIGATION.

The activities of . . . [the firm] were investigated on March 25, 1963 by

the Senate Committee on Foreign Relations during its study of the activities of nondiplomatic representatives of foreign principals in the United States. The Committee Chairman, Senator J. William Fulbright, made it clear on several occasions that the Committee was not challenging the right of public relations firms to do business with foreign governments. The only issue was whether the public knew that it was getting foreign propaganda as required by the Foreign Agents Registration Act. Senator Fulbright pressed the point with painstaking care. When the . . . [spokesman for the firm] said that he did not engage in hardcore political lobbying, Chairman Fulbright took considerable time to establish the fact that the . . . Organization did engage in "political" propaganda. The Senator produced a letter dated November 22, 1961 . . . to Meiring which described the firm's propaganda work for the South African Government during the preceding seven months. . . .

What much of this work proves—beyond doubt—is the value of positive nonpolitical propaganda to create an effect essentially political. Political propaganda as such would have been largely ineffective. But institutional publicity—touching on South Africa's general life, economic, social, and cultural accomplishments, tourist attractions, sports, festivals, etc.—can tend to soften hard political attitudes, make for good feeling, and tend to correct misinformation about the country. (U.S. Congress Senate Committee on Foreign Relations, *Activities of Nondiplomatic Representatives of Foreign Principals in the United States*. Part 7, Hearing on March 25, 1963, 88th Congress, 1st Session, Washington, 1963, p. 708.)

* * * * *

Two years later, the government [employed] another American public relations firm. . . . to undertake "a professional survey and public opinion poll" to determine South Africa's image in this country. In a letter dated December 23, 1964, the South African Director of Information asked . . . [the firm] to "propose a program to counteract the harmful effects of current misconceptions of the true thrust and intention of South African policies. . . ." . . . [The firm] replied on January 4, 1965, that

South Africa has been the target of special interest and pressure groups internationally in recent years to an extent almost unbelievable in the history of militant propaganda. I am certain that no responsible person or group, in or out of the American government, desires misunderstanding with the Republic of South Africa, whose history so nearly parallels our own.

* * * * *

In addition to the above expenditures, the South African Government paid over \$141,000 during the first six months of 1965 for the tourist publicity of the New York office of the South African Tourist Corporation. Three American law firms were also in the employ of South Africa, one of them being a lobbyist for South African sugar.

THE NEW OFFENSIVE

By fiscal 1965/66, after a decade of continuous expansion, the information budget had risen to \$4,459,000 under a separate Department of Information created in 1962 with its own Minister in the Cabinet. The total personnel complement of the Department and its external service had risen to 378.

South Africa's accelerated drive for American support was launched in March 1965 by three full-page South African advertisements appearing in

The New York Times, *The Washington Post*, and four other major American newspapers. The first ad, on March 21, stressed South Africa's role as a rich, anti-Communist ally which has attracted 100,000 immigrants in the past three years. The second, five days later, eulogized the "miracle" of a "real Eldorado" where American corporations in 1963 reported "a 26 percent return on their outlays." And the third, on March 31, portrayed the Transkei as South Africa's "Pattern for Self-Determination" in the form of a "Community of politically independent, economically interdependent states." The response to the newspaper advertisements reportedly brought as many as 100 letters a day to the Embassy from Americans, some of whom were interested in emigrating to South Africa. *The Washington Post* reported that a "flock of other newspapers," seeking advertising income, had also contacted the Embassy.

South African officials are also exhibiting a new alertness in the treatment of the Republic's critics. One good example is their response to diplomatic correspondent William R. Frye, who is making a study of American policy toward South Africa for The Brookings Institution in Washington, D.C. After a visit to South Africa in March and April 1964, Frye published a series of articles in his syndicated column, "The World in Focus," in 78 newspapers, and in his syndicated news service, "The UN Today," in 16 newspapers. South African officials wrote letters of protest to the editors of many of these newspapers. Some of the editors subsequently canceled Frye's column.

Finally, South Africans are paying the expenses of a growing number of sympathetic American businessmen, journalists, professors and others, including wives, for tours of South Africa. The latest beneficiaries are a group of 14 American editors, publishers, and reporters who were given a tour of South Africa early in 1966. Four Americans were also brought to The Hague in 1965 by the South African Government to testify on its behalf in the South West Africa case before the International Court of Justice. While some of these trips are paid for by the government, others are financed by the South Africa Foundation, a private organization financed mainly by South African businessmen. Although the South Africa Foundation . . . contends that it does not engage in "political propaganda," the fact is that it buttresses the government by emphasizing only one side of the South African story—the boom in the White sector of the economy.

In the hope of improving the results of these propaganda efforts, the government is simultaneously attempting to stifle criticism at home and curtail it abroad. Visas have been denied to such American observers as Professor Gwendolen M. Carter, Director of Northwestern University's Program of African Studies, and Waldemar A. Nielsen, President of the African-American Institute. Visa application forms now contain a question asking if material will be written for publication. If the answer is affirmative, the application is sent to Pretoria for detailed screening. Few

graduate students now receive visas for research in South Africa. The whole system has tightened up, especially within the last three years.

Inside South Africa, the government is clamping down on the press and the English-speaking universities which in the past enjoyed an atmosphere of free speech. The press has been forced to undertake voluntary censorship in order to stave off repressive legislation. The opposition *Rand Daily Mail* has succumbed to the extent of booting "upstairs" to the post of editor-in-chief its talented and outspoken editor Laurence Gandar. In the universities, many faculty critics have left the country, some are confined by "banning" regulations, and most of those remaining find it expedient to curtail their expression of political views. Students, under the influence of parents, professors, and the government, are also becoming noticeably more conservative. Several organizations that seek to improve African conditions, such as the Institute of Race Relations, the Christian Institute, and the Defense and Aid Fund, are becoming the object of more and more overt attacks in this conformist political climate.

PROLIFIC AND ATTRACTIVE OUTPUT

The Information Service produces numerous informative periodicals, hundreds of attractive pamphlets and booklets, occasional press releases, and films for cinema and television. Its officers also make many speeches.

Six Information Service periodicals reach American readers, three of them produced in South Africa and the other three by the New York office. *South African Panorama* is an attractive illustrated monthly, including handsome color photography and many readable and informative article about the Republic. *South African Digest* (formerly *Digest of South African Affairs*) is a valuable and convenient weekly featuring the latest statements by government officials and useful data on recent developments. *Bantu* is an illustrated monthly dealing mostly with Bantu developments and produced largely for South African readers although a limited number of copies are sent overseas.

The New York office produces *South African Summary*, a weekly news release which summarizes for American readers material cabled daily from Pretoria to the New York office. *Business Report* is a second weekly news release, somewhat longer than the *South African Summary*, which emphasizes economic data and other news of special interest to American business. The Third New York periodical, *Scope*, is a more elaborate illustrated monthly on items of contemporary relevance. By December 1965, according to information filed with the Department of Justice, the monthly circulation of *Scope* had risen to 14,000, *South African Summary* to 4,800, and *South African Business Report* to 3,100. The monthly *Panorama*, which is produced in South Africa, went to 1,200 American recipients in May 1965.

The hundreds of pamphlets and booklets include the complete texts of many speeches by Cabinet Ministers, reprints of articles by Americans and others favorable to South African policy, and a great many publications, both long and short, written especially for the Information Service covering many aspects of South African life. The effective Audio-Visual

section of the Department of Information produces a number of films each year, mostly in color, and has won more than two dozen cups, medals and diplomas at international film festivals. It produces films in English, Afrikaans, French, German, Dutch, Italian, Spanish, and Portuguese. The most recent award came in October 1965 at the Ninth International Film Festival in San Francisco, where its film on "White South Africans" won first place among 225 films submitted by governments in the category "The film as communication—government film for general information."

The television section of the Department of Information has also produced several hundred films for television, but in the words of the Department's 1963-64 report: "Television gives a preference to sensational material; consequently it is difficult to get constructive material on South Africa into television screens." Successful efforts were continued, however, to get one-minute television recordings of interesting events in South Africa incorporated in U.S. television news services. Moreover, during 1963-64, officials of the Information Office in New York participated in about 60 U.S. television and 50 radio interviews, as well as giving about one hundred lectures to American audiences.

Finally, at the end of October 1965, Dr. Verwoerd officially opened the new Bloemendal international shortwave radio center near Meyerton which is to beam "The Voice of South Africa" in nine languages for a total of 30.25 hours a day. When complete, the station's powerful transmitters will be able to reach "about every corner of the earth."

By 1964, the Department of Information was able to report that while many Americans remained "cynical" about South Africa's racial experiment, "there was an appreciable decline in the eagerness of journalists to forecast nothing but darkness for South Africa. . . ."

CHALLENGE AND RESPONSE IN INTERNAL CONFLICT: PSYCHOLOGICAL OPERATIONS IN PORTUGUESE GUINEA (1959 until 1965)*

By I. WILLIAM ZARTMAN

While the propaganda by both sides in the Portuguese-Guinea conflict for internal and external consumption tried to convey a sense of victory, certain themes run so contrary to prevailing international sentiments in specific situation as to be unacceptable. As a result, the insurgents garnered much international support while the Portuguese were almost completely isolated on this issue.

BACKGROUND

Like other African colonial territories, Portuguese Guinea was caught up with the fervor for independence sweeping across Africa in the mid-twentieth century. If independence had not been achieved by Guinea in 1958 and Senegal in 1960, there would most likely have been no in-

*Excerpts from *Challenge and Response in Internal Conflict, Volume III The Experience in Africa and Latin America*, The American University, Center for Research in Social Systems, Washington, D.C., April 1968, pp. 353-370 (written in early 1965).

surgency in Portuguese Guinea. This was less the result of any direct aid from these two states than simply the psychological influence of neighboring areas' having transformed the slogan of "independence" into reality. In a larger context, the situation also resulted from a world opinion that put "colonialism" in the company of bad words and "independence" among the good.¹

Slightly larger than Massachusetts and Connecticut combined, this small wedge of Portuguese territory on the coast of West Africa, between the former French colonies of Senegal and Guinea, is a tropical lowland region of mangrove swamps and marshes along the Atlantic, with low foothills in the interior. It is roughly comparable in size and terrain to the coastal region of South Carolina. Fifteen to thirty miles off the coast, which is broken by numerous inlets and estuaries, lies the Bijagos archipelago of about 25 small islands. The country's largest city is Bissau, the chief seaport and capital, with a population of 30,000.

* * * * *

African Dissidence Is Largely Unstructured

From the urban and "civilized" population, feelings of dissatisfaction and nationalism have spread to the 500,000 Africans living mainly in the interior. In the face of this growing alienation, some support for Portugal has come from tribal chiefs who owe their importance and power to Portuguese backing, and from other tribal elements. Particularly in the Fula regions of the eastern interior, traditional elders have sought and found support from the Portuguese against their younger nationalist rivals.* Traditional animosity between the intermingled Diola and Manjak peoples in the north has also been reflected in conflicting reactions to Portuguese rule.² Intertribal disputes are thus translated into nationalist-colonialist terms, and sometimes they result in African support for the colonial power. In other instances, tribes which agree in opposing the Portuguese have joined rival nationalist organizations because of tribal differences.

Some tribes have a long tradition of resistance to European penetration. The Portuguese had to conduct military campaigns against coastal groups such as the Bijagos and Balantes as late as the World War I period. These tribes are located in the heavily populated areas of the earliest and deepest Portuguese penetration. Farther east in the interior, where there are fewer Europeans, there tends to be proportionately less antagonism to colonial rule.

During the 1950s, opposition to Portuguese rule grew among the *metiços* and urban African populations, specifically among laborers and those who had received some education. In 1952 an unsuccessful effort was made to organize an African political club. In 1954, an African sports and recreation association was formed, but it was repressed by the

*A similar situation, also involving the Fulas, occurred in neighboring French Guinea under French rule.

government because it opened its membership to *indígenas* as well as to *assimilados*. In 1955 an attempt was made to create a frankly political Movement for the National Independence of [Portuguese] Guinea (MING), but it failed for lack of support among civil servants and commercial employees in the face of Portuguese opposition. Between 1956 and 1958, urban workers were organized informally to the extent that they carried out strikes for specific labor benefits, but no African labor union was permitted.

Political activity during the 1952-59 period was limited to reform groups who concentrated on demands for better wages and political rights as well as for ending "contract" or forced labor, and the Portuguese system of dividing the African population into *indígenas* and *assimilados*.³ As attempts to organize and strike were put down by the Portuguese, these specific grievances became the basis for the nationalist movement.

INSURGENCY

The Partido Africano da Independência da Guiné e Cabo Verde (PAIGC), which despite its lack of legal status was to become the major insurgent organization, was founded in September 1956. It concentrated its efforts among urban workers and artisans, organizing strikes for specific demands. An important change in tactics followed the "massacre of Pigiguiti quay" of August 3, 1959, when a port strike in Bissau was ended bloodily with some 50 deaths. After this event, which marked the beginning of active insurgency, the PAIGC organization turned away from the city and toward the bush, where the Portuguese presence was weaker.⁴

Insurgent Phases and Areas of Operation

The insurgency involved a preparation stage, a phase of open guerrilla warfare, including some area control from the very beginning, and, from 1964, what may be considered a regular military phase. Actual fighting broke out during the middle of 1962 and has taken place in most of the heavily populated western half of the country. As of this writing in early 1965, the insurgency is still ongoing.

During the first year, the insurgency was largely contained in a southern area between Bissau and Bafatá on the Geba River and the border with Guinea. During the second year of the insurgency, fighting spread to the Senegal border region between the Cacheu River and the frontier around São Domingos, and in the Oio forest between Mansôa, Farim, and the Cacheu River, while intensifying in the original southern zone around Cacine and Catió.

Insurgent Aims, Strategy, and Tactics

The insurgents' purpose was to obtain total independence from Portugal. Their strategy has been to destroy the military and economic founda-

tion of the Portuguese presence and to wipe out installations that the PAIGC regarded as the symbols and bases of exploitation and socioeconomic disruption. Attacks were also launched to capture materiel, especially arms and small craft; and PAIGC claimed to have solved its arms problem with captured Portuguese weapons.

Guerrilla attacks during 1963 and 1964 followed several general patterns. Lines of communication—roads, bridges, and river transportation—were primary targets after the first sabotage attempts in 1962. Portuguese barracks and troop stations were other military objectives. Barracks and towns—such as São João and Fulacunda—were raided and burned, but never permanently occupied. Economic objectives were Portuguese trading posts and *cercos* (peanut storage bins), and installations of the large trading companies have been frequently hit. Guerrilla activity has thus been directed mainly against Portuguese military forces and commercial installations, although native supporters of the Portuguese have been killed along with Portuguese troops.

Attacks occurred most frequently at night, following classic guerrilla tactics of sudden ambush, after which the attacking force melted away into the forest. Before 1964, few operations ever reached a “military” phase, in the sense of pitched battles rather than guerrilla engagements. Occasionally, the size of forces involved in an ambush led to prolonged fighting rather than simply a hit-and-run raid, but this was usually by accident rather than by design.

Rebel Intelligence and Propaganda Efforts

To prevent counterattack, warning systems were set up around insurgent villages, so that the rebels’ own local population could be notified in time to flee into the bush before Portuguese troops arrived. This system was not always effective, however, since Portuguese sympathizers were also found in some villages.⁵ According to Portuguese sources, insurgent intelligence made extensive use of the women attached to guerrilla groups: On trips into town to make purchases, they were supposed to observe and report on Portuguese military movements.⁶

Intensive propaganda efforts by the insurgents to encourage desertion by Portuguese soldiers and officers have allegedly achieved some success.⁷ Word-of-mouth propaganda and written tracts have been used to win over the native population and to spread the idea that PAIGC is the wave of the future, while Portugal is on the way out. Any talk of discouragement among the small Portuguese population is inevitably overheard in the towns, and this supports the insurgents’ propaganda effort. Continuing attempts are also made to organize the native population—politically, into the PAIGC’s territorial units, and functionally, to give food, shelter, and information to the guerrillas.

* * * * *

PAIGC’s Internal Support Base

The PAIGC’s operations and membership gave it the best claim for

being the most significant nationalist movement in Portuguese Guinea. Relations with other nationalist groups tended to be hostile, as each group claimed to be the exclusive representative of the nationalist movement or, alternatively, an indispensable segment of the movement that must be taken into account in any unification effort. Within this contradictory atmosphere of hostility and unity, some attempts at political coordination were made.

A stillborn attempt to unify the PAIGC and the Union des Populations de la Guinée Dite Portugaise (UPG), led by Henri Labery, a Capeverdean in Dakar, took place in that city in July 1961 under the name of the Front Uni de Libération de Guinée et du Cap Vert (FUL). More successful was a later organization, the Front pour la Libération et l'Indépendance Nationale de la Guinée Dite Portugaise (FLING), which brought together the UPG, the Mouvement de Libération de la Guinée Dite Portugaise (MLG), led by Henri and Francois Mendy of Senegal, and the Rassemblement Démocratique Africain de Guinée (RDAG), led by Doudou Seydi and Cheik Mane of Senegal. In November 1963 FLING was reported to have been reconstituted, bringing into membership the moderate Union des Ressortissants de la Guinée Portugaise (URGP), or Union of Nationals of Portuguese Guinea, led by Benjamin Pinto-Bull, a Capeverdean in Dakar.

* * * * *

Importance of External Aid to the Insurgents

External aid has had the effect of keeping the insurgency alive, primarily by means of supplies of small arms and secondarily through the military sanctuary and haven for PAIGC leadership provided by the neighboring states, Guinea and Senegal. In the case of the splinter movements, including the MLG, sanctuary was everything, for the groups had little support and carried out little activity inside Portuguese Guinea. In the case of PAIGC, sanctuary and haven meant arms, offices for organization, and bases from which to carry out diplomatic operations to influence world opinion.

There is no way to measure the value of diplomatic support as against such material assets as arms or financial aid, but it is safe to say that the African states' propaganda campaign carried on by diplomatic means against Portugal has been of great advantage to the insurgents. Without it the insurgency would have been subject to demoralization, condemnation by world public opinion, and a more vigorous riposte from Portugal; furthermore, it kept hope and faith alive among the insurgents. Thus the diplomatic aspect of external aid, although intangible, may have been more effective than its few concrete victories might suggest.

Collective African Diplomatic Support

African aid to the insurgents of Portuguese Guinea has been given individually by single nations and collectively. It was, for example, at the second All African Peoples Conference, held in January 1960 at Tunis,

that the PAIGC joined the Movimento Popular de Liberação de Angola (MPLA), led by Mario de Andrade, to form the Frente Revolucionária Africana para a Independência Nacional (FRAIN). In Casablanca in April 1961, this organization was enlarged to include nationalist movements from other Portuguese territories and became the Conferência de Organizações Nacionalistas das Colônias Portuguesas (CONCP), with coordinating headquarters in Rabat.⁸

Three African interstate groups—the Casablanca Group, the African and Malagasy Union, and the Organization of African Unity (OAU)—have given diplomatic support to the PAIGC, and their members in the United Nations (U.N.) have sponsored measures, such as boycotts of Portuguese goods, in order to exert pressure for the rebel cause. In 1963, the OAU voted \$700,000 to assist the various insurgent movements in Portugal's African colonies.

Support From the African States of Guinea and Senegal

Aid from Guinea to the insurgents began in 1959, soon after that country gained independence from France. The external seat of the PAIGC was set up in the Guinean capital of Conakry following the already mentioned "massacre of Pigiguiti quay."⁹ Guinea's aid in the form of sanctuary led the insurgents to concentrate their efforts in the southern portion of Portuguese Guinea near the Guinean border during the early stages. Arms supply routes run from Conakry across the border into the Portuguese Guinea interior. A rest and indoctrination center was known to exist outside Conakry. Guerrillas have received training in Guinea, ranging from political and military instruction to political and labor courses in the Guinean "workers' university" in Conakry. Guinea has given financial aid and has beamed radio propaganda across the border to Portuguese Guinea since 1959 in support of PAIGC.

Guinea has given active diplomatic support to the PAIGC through the OAU, United Nations, and Casablanca Group. In an investigation of the Portuguese Guinean problem held by the U.N. in 1962 and by the OAU in 1963,¹⁰ the Guinean chairman of the subcommission in each case facilitated the PAIGC's presentation of its case. Guinea is also a member of the OAU liberation coordination committee of nine.

Senegal's position has been equivocal. Senegalese contacts with Portuguese Guineans and Capeverdeans antedated World War II, but Senegal could not proffer aid until it achieved independence in 1960. Both the PAIGC and MLG had bureaus in Dakar, but the MLG took greater advantage of this opportunity than did the PAIGC. At the OAU foreign ministers' conference in Dakar in August 1963, Senegal threw heavy diplomatic support behind FLING, of which the MLG was a part, effectively blocking OAU approval of the PAIGC as the sole representative of the nationalist movement in Portuguese Guinea.¹¹ Senegal is also a member of the OAU's liberation committee and special investigatory committee. Portuguese Guineans and Capeverdeans living in Dakar re-

ceived scholarships and education in Senegalese schools and at the University of Dakar. Some medical care was given to wounded insurgents in Senegalese hospitals. The insurgents also received press support through the Senegalese government's newspaper, *L'Unité Africaine*, and through Radio Senegal. The leaders of many Portuguese Guinea nationalist splinter groups were Senegalese citizens who had jobs in Senegal.

Support From Morocco, Algeria, and Ghana

Moroccan aid probably began about 1961. Significant events were the founding of the Casablanca Group in January 1961; the Conference of Nationalist Organizations of Portuguese Colonies (CONCP) in Casablanca in April 1961; and the establishment in June 1961 of a Moroccan ministry for African affairs, through which aid to the insurgency is coordinated. The Moroccan army has given training to guerrillas, and Morocco has given both financial aid and important quantities of arms. Office space has been provided in Rabat for the PAIGC bureau and CONCP offices, and diplomatic support for PAIGC has also come from Morocco in the United Nations, the Organization of African Unity, and the Casablanca Group.

Algeria became an important source of arms after the end of the Algerian war, principally through the shipment of war surplus; it has also been a source of financial aid. Radio Algiers propagandized the insurgent's cause, and support was given through the Algerian press, particularly *Révolution Africaine*, which was read throughout much of the continent. In the United Nations, the Organization of African Unity, and the Casablanca Group, Algeria has given diplomatic support to PAIGC against rival groups; it was a member of the OAU special investigating committee and liberation coordination committee. Algerian aid is coordinated through the offices of the president and the foreign ministry.

Ghana also gave diplomatic support to PAIGC through the United Nations, the Organization of African Unity, and the Casablanca Group, and has granted arms and financial aid in small quantities. A PAIGC bureau was located in Accra; money, aid, and accommodations are being handled by the Ghanaian African affairs bureau. Ghana's press and radio have given heavy propaganda support to the insurgents.

External aid from African sources has aroused little international reaction. Guinea and Senegal have been very careful to keep their aid limited and to avoid condoning direct guerrilla incursions from their soil, lest the Portuguese use the doctrine of "hot pursuit" to ravage such territory—the Tunisian experience in the Algerian war was a vivid lesson. As a result of this policy, Senegal was even able to have Portugal condemned by the United Nations Security Council on one occasion when it bombed the Senegalese village of Bouniak on April 8, 1963, following an MLG raid. The solidarity between newly independent African governments and aspiring independence movements in Africa has been more or less accepted throughout the world.

Aid From Communist Countries

There was more international concern, especially in the West, over Communist aid. The U.S.S.R. Czechoslovakia, and possibly China have contributed important quantities of arms and given training, including education in Soviet schools, as well as guerrilla and political instruction. In Guinea's "labor university," Communist-bloc instructors also appear to have taught insurgents. There are no reliable reports of any foreign personnel operating with the guerrillas in Portuguese Guinea.

As far as can be determined, Communist influence has been ancillary to nationalism and did not, in any case, initiate the insurgency. *Mestiços* and modernized Africans, especially the assimilados, have had occasion to contact members of the illegal, clandestine Portuguese Communist Party (PCP) when in Portugal for schooling, training, or work. Insurgency leaders have also been in contact with nationalist leaders from Angola and Mozambique who are themselves influenced by Communists, whether Portuguese or other nationalities. Thus, although indirect contacts exist and have grown since the outbreak of the insurgency, the insurgency is a product of local conditions.

Portugal has emphasized the Communist aspect of the fight in the United Nations, but since the extent of Communist infiltration into the movement is not known, Western governments have limited their reaction to careful watching. It is by no means proved that arms aid has won for the bloc countries any permanent advantage among the insurgents.

* * * * *

COUNTERINSURGENCY

Portugal's counterinsurgent strategy in this small West African colony evolved in reaction to the escalation of insurgent activity. As the nationalist movement gained momentum, the Portuguese turned from police measures to military operations. Later, the Salazar government instituted political reforms which appeared to have been taken in response to the growth of African nationalism throughout Portugal's African possessions, especially in Angola, which was in open revolt after 1961. Since Portugal's energies were so fully engaged in Angola, its military effort in Guinea was essentially defensive, although there were several military offensives against guerrilla-held areas.¹²

Portugal's initial response to the nationalist insurgency was to use police repression. After a number of strikes had taken place, a branch of the Portuguese political police, the *Polícia Internacional de Defesa de Estado* (PIDE), was set up in Portuguese Guinea in 1957. The Bissau port strike was ended by police action in August 1959, and the first large wave of arrests began in April 1960. Demonstrations in the cities were promptly broken up through the use of police and security forces. After 1959, there were no successful strikes. A 9 o'clock curfew was imposed in the principal towns, but this has been lifted from time to time.¹³

* * * * *

Psychological Operations and Civic Action

Portuguese efforts at psychological warfare have met with varying degrees of success. African support for the Portuguese has come from various groups and tribes, notably the Fula, an eastern tribal group that has cooperated quite consistently with the Portuguese.¹⁴ Effective use of the printed word has been limited by high illiteracy rates and general lack of public confidence in the government's official statements and commentaries. Government information media have in some cases succeeded in encouraging insurgents to defect, by carrying offers of pardon to guerrillas in the interior.¹⁵ Penitent prisoners have been rewarded with high-paying jobs as civilian construction workers, but most efforts at prisoner rehabilitation have occurred in jail. There has been no known offer of general amnesty during the insurgency.

Because of their budgetary inability to carry out a broad program of social welfare, the Portuguese have concentrated their civic action efforts in operational areas; army doctors, for instance, devote much of their own time to helping local people. There has been no native resettlement program, and there have not been enough insurgents captured to warrant a general rehabilitation program. The PAIGC has repeatedly charged Portugal with the use of torture and brutal killings, and also with the maintenance of a concentration and forced labor camp on Galinhas Island.¹⁶

Programs of Social and Political Reform

Positive social and political reforms have also been undertaken by the Portuguese in an attempt to restore harmony in their realm. The *as-similado* system was abolished by the reforms of 1961-62; thus all inhabitants of Portuguese Guinea were presumably placed on an equal footing under Portuguese law. The legal status of *indígena* and its accompanying head tax were also abolished, along with forced labor laws. However, the effect of these changes has not appeared to be very great. Some "public labor" or even "private labor" still persisted, although it is less widespread than before; other personal taxes replaced the head tax.

Critics of Portuguese policies claimed that the proclamation of equality on paper had little meaning in the absence of greater economic and educational opportunities and that the reform measures, as much as any other measures, were imposed by a foreign authority.¹⁷ In this view, the extension of Portuguese citizenship to all inhabitants of Portuguese Guinea would have meaning only if effective legislative bodies were created, to be elected by the entire population, and if a vigorous political, social and economic educational campaign were carried out prior to the vote.

Political reforms have also been instituted. New colonial statutes were drawn up in 1961-62 and promulgated in June 1963 to liberalize the political regime of all the overseas territories, including Portuguese Guinea.¹⁸ Pursuant to the Organic Law of 1963, a partially elected legisla-

tive council was authorized. On the local level, municipal committees and parish and local boards were established. The new organic law, which was indefinite on the powers of these bodies, provided for transitional conditions which left effective power in the hands of appointed officials. Laws passed by the council were subject to approval of the Portuguese overseas minister in Lisbon. Elections for the legislative council were held in March 1964, and the first council session opened in April. Voter registration requirements were so rigorous, however, that only a small percentage of the population could vote.¹⁹ In any case, there was little or no indication that these reforms achieved appreciable positive effects.

By mid-1962, Portugal had also permitted the creation of the moderate nationalist party, the URGP or Union of Nationals of Portuguese Guinea, under the leadership of Benjamin Pinto-Bull, brother of the secretary general of the province. The Portuguese encouraged the URGP and allowed it to present its case for reforms, following which it was immediately criticized by other nationalist groups as "neo-colonialist." According to African reports, the URGP was eventually frustrated by Portuguese intransigence and, tired of impotent moderation, merged with FLING by the end of the year.²⁰

Reactions in Portugal

Public opinion in metropolitan Portugal generally supported the government's suppression of the insurgency, for the territory of Portuguese Guinea has been considered an integral part of Portugal, and the insurgents as tools or agents of communism. Portuguese declarations and propaganda, however, have paid much less attention to Portuguese Guinea than to Angola and Mozambique, and many Portuguese were probably largely ignorant of the situation, possibly even of the existence of Portuguese Guinea. Relatively few Portuguese troops were involved, and the economic damage suffered by private investors in Portugal was fairly small and affected few people; thus there were few ways in which the insurgency touched the daily lives of the Portuguese people.

Still, the problem must also be seen in the context of the Salazar regime's general political position.²¹ Instead of retiring in 1958, as had been predicted, Salazar strengthened his hand in order to counter growing opposition. He consolidated his own political position at home, directed popular dissatisfaction against foreign scapegoats, and hardened his counterinsurgency policies in Africa. In June 1964, for example, the post of governor of Portuguese Guinea was combined with that of the military commander in chief. At the same time, Salazar encouraged ostensibly liberal reforms in the colonies, and there were persistent semiofficial rumors of greater liberalization.

International Reactions to Portuguese Policies

Portugal's colonial policies have aroused a variety of international reactions.²² Communist-bloc countries loudly condemned Portugal's at-

tempt to maintain its colonial rule in Portuguese Guinea. Spain has given consistent support to Portugal in the United Nations; France, Belgium, and Great Britain have given partial support. The United States, Britain, and France have at times expressed concern for the violence in the Portuguese colonies, and in April 1963 the U.N. Security Council unanimously voted to condemn Portugal in the Bouniak incident. At the same time, however, Western states have been reluctant to support what they sometimes view as empty and self-righteous resolutions presented by the African states in the United Nations. Western votes for these resolutions have more often reflected an intention to appease the Africans than to condemn the Portuguese.²³

* * * * *

Attitudes in Latin American countries have varied. PAIGC officials have cited Brazil and Venezuela as areas where there has been some unofficial support for the nationalist movement, revolving around Salazar opponents in exile there. Through 1963, however, Brazil and the Dominican Republic supported Portugal in the United Nations on matters concerning Portuguese Africa, whereas all other Latin American states have rather consistently voted against her.

Although African countries have generally condemned Portuguese colonial policy, only Portuguese Guinea's immediate neighbors and radical African nationalists have shown much interest in this particular Portuguese colony. African reactions have been based on both moral and political grounds; they have protested the limitation on indigenous African rights and sought to promote solidarity among all African nationalist and independence movements. Portuguese attempts to suppress insurgency in Portuguese Guinea have been supported in Africa only by the white governments of Rhodesia and the Republic of South Africa, two countries also under diplomatic attack for similar policies.

NOTES

¹ Much of the information for this article was gathered in interviews with three men associated with the insurgents—Amilcar Cabral, in Conakry in October-November 1962; Arraujo, in Dakar in May 1963; Portuguese Embassy Secretary Luis Navega, in December 1963; and Portuguese Military Attaché Col. Pinto-Bessa, in December 1963. Some of this interview material was previously published in the author's article, "Africa's Quiet War: Portuguese Guinea," *Africa Report*, IX (February 1964), 8-12. In the present study, specific source reference will be made to the interviews or to the previous article only when necessary.

INSURGENT APPEALS AND METHODS

Political communications emanate from intergovernmental organizations, national governments, semigovernmental organizations, and private institutions. A growing number of domestic and international propaganda appeals derive from insurgent groups.

Domestically, insurgent propaganda may serve one or more objectives. It often seeks to reinforce the revolutionary spirit of the insurgents and their supporters. It may attempt to attract others to the cause of the rebels or to demoralize those loyal to the incumbent regime. On the other hand, it may simply take advantage of an event or development in such a way as to add to the state of unrest in the country.

Internationally, insurgent appeals may attempt to win foreign support (including the support of international organizations) to undermine the

international legitimacy of an existing administration, or to create the appearance of a viable opposition movement.

The means that the insurgents utilize to communicate with the population of the area in which they operate, or to which they aspire, depend upon the circumstances of the specific insurgency. In general, however, groups that are illegal can rely very little upon the mass media such as the newspapers. Instead, rebel groups tend to look to informal channels of communication and social movements for their primary channels in most cases.

The four articles that follow illustrate and discuss the appeals and methods of various revolutionary groups. The content should not be considered to have official Department of Defense approval, express or implied.

Insurgent Appeals

OLAS: GENERAL DECLARATION*

Supranational or international revolutionary organizations must rely on ideological and highly political statements of doctrine.

This Conference [of the Latin American Solidarity Organization], after a deep and exhaustive analysis of the conditions existing on the continent and after having ideologically clarified the essential problems of the revolutionary movements, has arrived at the following conclusions:

Latin America exists in conditions of convulsion, characterized by the presence of a weak bourgeoisie which, in indissoluble union with the landholders, constitutes the controlling oligarchy of our countries. Increased submission and almost absolute dependence of this oligarchy on imperialism has caused the intense polarization of forces on the continent consisting of the oligarchic imperialist alliance on one side and the peoples on the other. The peoples have a tremendous revolutionary power which is only waiting to be channeled by a correct leadership, by a revolutionary vanguard, in order to develop or to initiate the fight.

That power is the power of the proletarian masses, of city and rural workers, of a poor and highly exploited peasantry, of the young intellectuals, of students with a great tradition of struggle, and of the middle strata, all joined together by the common denominator of the exploitation to which they are subjected.

In the face of the crisis of the whole structure of the economic, social and political system throughout the continent, and the growing rebelliousness of the peoples, imperialism has designed and developed a continental strategy of repression which proposes vainly to detain the course of history. The survival of the colonial and neo-colonial systems of exploitation and domination are the aims of U.S. imperialism.

*The General Declaration of the Latin American Solidarity Organization Conference, Havana, July-August 1967.

This situation determines and demands that revolutionary violence be unleashed and developed in response to reactionary violence.

Revolutionary violence as the highest expression of the peoples' struggle is not only the path, but it is the most concrete and the most direct potential for the defeat of imperialism.

The peoples as well as the revolutionaries have confirmed this reality and consequently realize the need to initiate, develop and bring armed struggle to its culmination in order to destroy the bureaucratic-military apparatus of the oligarchies and the power of imperialism.

In many countries the special conditions prevailing in the countryside, the favorable topography and a potentially revolutionary social base, in addition to the special adaptation of technical methods and professional armies to repress the people in the cities (which, moreover, are ill-adapted to an irregular war), mean that guerrilla warfare is the fundamental expression of armed struggle, the best school for revolutionaries and their indisputable vanguard.

The revolution, already underway in some countries, an imperative necessity in others and a future prospect in the rest, has a well defined anti-imperialist character within its anti-oligarchic aims.

The principal objective of the people's revolution on the continent is the seizure of power by means of the destruction of the bureaucratic-military apparatus of the state and its replacement by the people in arms in order to change the existing economic and social regime. This objective can be achieved only through armed struggle.

The development and the organization of the struggle depend on choosing the right site on which to carry it out and the most adequate methods of organization.

The lesson of the Cuban Revolution, the experiences accumulated by the revolutionary movement in recent years throughout the world, and the presence in Bolivia, Venezuela, Colombia and Guatemala of an ever-growing armed revolutionary movement show that guerrilla warfare as a genuine expression of the people's armed struggle is the most effective method and the most adequate form for waging and developing revolutionary warfare in most of our countries and, consequently, on a continental scale.

In this particular situation the unity of the peoples, the identity of their aims, the unity of their views and their disposition to unite in carrying out the struggle are the elements characterizing the common strategy that must be opposed to that which imperialism is developing on a continental scale.

This strategy requires a precise and clear expression of solidarity, whose most effective characteristic is the revolutionary struggle itself, which extends across the continent and whose vanguard detachments are the guerrillas and liberation armies.

We, the representatives of the peoples of our America, conscious of the conditions which prevail on the continent, aware of the existence

of a common counter-revolutionary strategy directed by U.S. imperialism.

PROCLAIM:

1. That making the Revolution is a right and a duty of the peoples of Latin America;

2. That the Revolution in Latin America has its deepest historical roots in the liberation movement against European colonialism of the 19th century and against imperialism of this century. The epic struggle of the peoples of America and the great class battles that our people have carried out against imperialism in earlier decades, constitute the source of historical inspiration for the Latin American revolutionary movement;

3. That the essential content of the Revolution in Latin America is to be found in its confrontation with imperialism and the bourgeois and landowning oligarchies. Consequently, the character of the Revolution is the struggle for national independence, for emancipation from the oligarchies, and for taking the socialist road to complete economic and social development;

4. That the principles of Marxism-Leninism guide the revolutionary movement of Latin America;

5. That armed revolutionary struggle constitutes the fundamental course of the Revolution in Latin America;

6. That all other forms of struggle must serve to advance and not to retard the development of this fundamental course, which is armed struggle;

7. That, for the majority of the countries of the continent, the problems of organizing, initiating, developing and completing the armed struggle now constitute the immediate and fundamental task of the revolutionary movement;

8. That those countries where this task is not included in immediate planning must nevertheless inevitably consider this as a future probability in the development of their revolutionary struggle;

9. That the historic responsibility of furthering revolution in each country belongs to the people and their revolutionary vanguards;

10. That in most of our countries the guerrillas are the embryo of liberation armies and constitute the most efficient way of initiating and carrying out revolutionary struggle;

11. That the leadership of the revolution requires, as an organizing principle, the existence of a unified political and military command in order to guarantee success;

12. That the most effective type of solidarity that the revolutionary movements can offer each other lies precisely in the development and culmination of their own struggle within their own countries;

13. That solidarity with Cuba and cooperation and collaboration with the armed revolutionary movement are imperative duties of an interna-

tional nature, the duties of all the anti-imperialist organizations of this continent;

14. That the Cuban Revolution, as a symbol of the triumph of the armed revolutionary movement, constitutes the vanguard in the anti-imperialist movement of Latin America. Those peoples that carry out armed struggle will also place themselves in the vanguard as they advance along the road of armed struggle;

15. That the peoples directly colonized by European powers—or subjected to the direct colonial domination of the United States—who are now on the road to liberation must maintain, as their immediate and fundamental objective, their struggle for independence and their close ties with the general struggle on this continent, since this is the only way of preventing their being absorbed into the neocolonial system of the United States;

16. That the Second Declaration of Havana, a résumé of the great and glorious revolutionary tradition of the past 150 years of Latin American history, serves as a guiding document for the Latin American Revolution, and has been upheld, widened, enriched and made even more radical by the peoples of this continent during the past five years;

17. That the peoples of Latin America harbor no antagonisms toward any peoples of the world and extend their hand of brotherly friendship to the people of the United States itself, encouraging them to fight on against the oppressive policy of imperialist monopolies;

18. That the struggle in Latin America is strengthening its bonds of solidarity with the peoples of Asia and Africa and the socialist countries, especially with the Negroes of the United States, who suffer from class exploitation, poverty, unemployment, racial discrimination and the denial of the most basic human rights, and who constitute a force of considerable importance within the revolutionary struggle;

19. That the heroic struggle of the people of Vietnam aids all revolutionary peoples fighting against imperialism to an inestimable degree and constitutes an inspiring example for the people of Latin America;

20. That we have approved the Statutes and created a Permanent Committee with its seat in Havana for the Latin American Organization of Solidarity, which constitutes the true representation of the peoples of Latin America.

We, the revolutionaries of our America, the America lying south of the Rio Bravo, successors of those men who won our first independence, armed with an irrevocable will to struggle and a revolutionary scientific orientation and with nothing to lose but the chains which bind us.

ASSERT:

That our struggle constitutes a decisive contribution to the historic struggle of humanity to liberate itself from slavery and exploitation.

The Duty of Every Revolutionary is to Make the Revolution!

THE ALGERIAN PROBLEM*

BY THE ALGERIAN DELEGATION IN CAIRO

In colonial wars, a major insurgent goal is the establishment of a national personality—even if artificial—which may be claimed to have a prima facie right to self-determination.

Algeria is the case of a country annexed by a colonial power after a military conquest characterised by all aspects of classical imperialism. These aspects can be summed up as a policy of social depersonalization, exploitation and oppression of the Algerian masses for the sole benefit of the colonizing power and European settlers.

Colonialism has attracted the cultural and religious heritage of the Algerian nation, intent on depersonalizing the masses so as to exploit them further and to implement the policy of "assimilation."

The national language of the Algerian people is Arabic. Colonialism has sought to stamp out the Arabic language. The results of this policy are characterised until now by the refusal to allow the teaching of Arabic in Government schools and by the many hindrances to free education. Only in the Higher Institute of Islamic studies, and three Medersas (secondary schools), attended by less than 500 students, are Arabic studies pursued. In the French secondary schools, Arabic is taught as a foreign language. The opening of free primary-schools is openly hampered by the authorities who frequently close them down and arrest their teachers. One teacher (Cheikh Zerrouki) has been condemned to four years imprisonment for teaching Algerian history.

Even education in French is very limited. The percentage of illiteracy is 90 percent and today two million school-age children are deprived of any education. Two Algerian children out of 100 inhabitants go to school, while the proportion for the Europeans in Algeria is 16 students for 100 inhabitants. . . .

The Algerian problem is essentially a colonial one, and so long as the colonial regime continues to exist there can be no permanent solution and no permanent peace in Algeria, for it is in the nature of colonialism that it contains within itself the germs of continual conflicts and constitutes the greatest threat to peace. The Algerian people are deeply peace-loving. If there is any bloodshed in Algeria it is because the French Government have flatly rejected any peaceful solution of the problem.

The movement towards the independence of colonial peoples is gathering momentum and is becoming irresistible. Nevertheless, despite the changes which have occurred in Asia and in parts of Africa, in North Africa and particularly in Algeria, the French have persistently resisted any alteration in the status quo. In November, 1954, Mr. Mitterand, French Minister of the Interior, not only reaffirmed both inside the French Parliament and elsewhere that Algeria is a part of France and

*From "What Is Algeria," (Cairo: Algerian Delegation), 1955.

that "no interference by other countries in the Algerian question will be tolerated," but he also stated "*for Algeria the only negotiation is war.*"

The fact remains, however, that the Algerian problem exists and can no longer be ignored. The military operations are continuing and the French now talk of an "impasse" and of the necessity of sending more and more reinforcements. French manoeuvres to suppress this problem, to hide it from the outside world are—as in the case of Tunisia and Morocco—doomed to failure. *From the legal point of view Tunisia and Morocco are "protectorates" while Algeria is considered "a part of France."* In reality the problems of the three countries are the same and the fictions invented by France to confuse the issue have been rudely destroyed by the latest events in Algeria. The political aims of Tunisia, Morocco and Algeria are the same; and their peoples look towards the establishment of independent states; their destiny is linked to each other in the future as it was in the past.

Therefore, the basic solution for the North African problem lies firstly in the recognition of the fundamental fact that there is a single problem and that attempts to appease one part of North Africa in order to be able to crush another more effectively are destined to failure.

The French have to realise that the use of military repression against the force of nationalism cannot succeed. Sooner or later the French will have to recognise Algerian aspirations and to come to terms with the nationalists' demands. The continuance of forceful repression in Algeria will only cause increased bloodshed and bitterness between the Algerian and French peoples.

1. *Algerian Demands:* The political demands of the Algerians today, as since the end of the last World War, remain the establishment of a Sovereign Constituent Algerian Assembly elected by universal direct suffrage without distinction of race or religion. Such an assembly will enable the Algerian people to give expression to their aspirations through a genuinely representative body which will then undertake negotiations with France to define future Franco-Algerian relations. The prior conditions for such elections would be the abolition of the present police state government, the release of all political prisoners, the ending of police and military repression and the restoration of all civil liberties.

The Algerian Nationalists are for the establishment of a Social and Democratic Republic in Algeria.

2. *An International Problem:* Today the Algerian problem is not the concern of France alone but of the whole world—and particularly of those peoples who stand for abolition of Colonialism everywhere.

The 29 countries meeting at Bandung from April 18th to April 24th [1955] specifically considered the situation in Algeria.

The Conference declared its unanimous support of the right of the Algerian people to self-determination in the following terms:

In view of the unsettled situation in North Africa and of the persisting denial to the peoples of North Africa of the rights to self-determination, the Asian-African

Conference declared its support for the rights of the peoples of Algeria, Morocco and Tunisia to self-determination and independence and urged the French government to bring about a peaceful settlement of the issues without delay. (Chapter D, Paragraph 2)

In addition, the Conference recognized that the basic right of the Algerian people to study their own language and culture had been suppressed, and condemned this denial of fundamental rights as an impediment to cultural advancement and to cultural co-operation on the wider international plane.

In a letter dated July 26th, 1955 addressed to the Secretary-General of the United Nations, the representatives of the Asian-African countries requested the "Question of Algeria" to be included in the Agenda of the tenth session of the General Assembly of the United Nations. They declared . . .

The right of self-determination occupies a position of decisive importance in the structure of the United Nations. In the first Article of the Charter itself, it is specifically enumerated among the Purposes and Principles of the Organization; it is cited again in Article 55 as the basis of international economic and social co-operation; and it is affirmed in resolution 637 (VII), adopted by an overwhelming majority of the General Assembly, as a prerequisite to the full enjoyment of all other fundamental human rights. The emergence into independence of the peoples of many nations previously dependent is among the most encouraging features of the first decade of the United Nations history. On the other hand; the denial of the right of self-determination to other dependent peoples or undue delay in its implementation is a potential source of international friction and of concern to the international community.

It is against this background that the United Nations should consider the deteriorating situation in Algeria, which has become a cause for growing concern. The position in Algeria is the direct result of colonial conquest, and the people of Algeria cannot be said to have exercised their right to self-determination as envisaged in the United Nations Charter. Delay in the exercise of this vital right can only frustrate the legitimate aspirations of the Algerian people, embitter relations between them and the French authorities and lead, as it is in fact doing, to the suppression of other fundamental rights, the retardation of cultural development and the imposition of order by force alone.

The French Government, for its part, has been quick to appeal to the Atlantic Pact Powers to support its attitudes towards Algeria and has already succeeded in obtaining permission from NATO High Command to withdraw French forces from Western Germany for use in Algeria. France is making every effort to put pressure on her friends and allies in case of the "internationalisation" of the problem.

The Algerian people are today being hard pressed by the forces of repression ranged against them. They know that their struggle for independence has entered a new and critical phase and that the sacrifices demanded of them are very great. They have accepted this and they have pledged themselves to stand united until final victory is achieved throughout North Africa. They know that in this struggle they are not alone, that millions throughout the world are watching their efforts with sympathy.

The Algerian people call upon the democratic forces in the world to take up the cause of Algerian freedom. The Algerians firmly believe that those who have so valiantly championed the cause of freedom in Morocco,

Tunisia and other parts of the world will not fail in their response to the people of Algeria. For Algeria is a part of the great struggle of peoples against the curse of colonialism, still powerful but yielding step by step to the irresistible forces of freedom.

WE ARE AT WAR*

BY THE AFRICAN NATIONAL CONGRESS

Where insurrectionary groups enjoy not military successes the emphasis on the survival and continued activism of the revolutionary group is primordial.

On 16th December, 1961, Unkhonto We Sizwe, military wing of the ANC, made it known that we, the oppressed people of South Africa, would fight for our rights. We made this known not only with words. Dynamite blasts announced it.

From 13th August, 1967, our men of Umkhonto We Sizwe, together with our brothers of ZAPU (Zimbabwe African People's Union) have been fighting the oppressors in Matabeleland, Wankie and further south.

The Vorster government, through the radio and newspapers, continues to lie about this fighting.

The truth is very different from what these newspapers have reported. Our men are armed and trained freedom-fighters, not "terrorists." They are fighting with courage, discipline and skill. The forces of the Rhodesian racialists suffered heavy losses. So also did the white soldiers sent to Rhodesia by Vorster to save the Smith regime from collapse.

The freedom-fighters have inflicted heavy losses on the enemy. Apart from those who have been ambushed and killed, hospitals at Bulawayo and Wankie are crowded with wounded Smith and Vorster forces. Several South African helicopters and military transport planes have been brought down over the past three months.

The fighting will go on in Rhodesia and South Africa. We will fight until we have won, however long it takes and however much it will cost.

WHY WE FIGHT

To you, the sons and daughters of the soil, our case is clear.

The white oppressors have stolen our land. They have destroyed our families. They have taken for themselves the best that there is in our rich country and have left us the worst. They have the fruits and the riches. We have the backbreaking toil and the poverty.

We burrow into the belly of the earth to dig our gold, diamonds, coal, uranium. The white oppressors and foreign investors grab all this wealth. It is used for their enrichment and to buy arms to suppress and kill us.

In the factories, on the farms, on the railways, wherever you go, the hard, dirty, dangerous, badly paid jobs are ours. The best jobs are for whites only.

*Leaflet distributed by the African National Congress.

In our own land we have to carry passes; we are restricted and banished while the white oppressors move about freely.

Our homes are hovels; those of the whites are luxury mansions, flats and farmsteads.

There are not enough schools for our children; the standard of education is low, and we have to pay for it. But the government uses our taxes and the wealth we create to provide free education for white children.

We have suffered long enough.

Over 300 years ago the white invaders began a ceaseless war of aggression against us, murdered our forefathers, stole land and enslaved our people.

Today they still rule by force. They murder our people. They still enslave us.

ONLY BY MEETING FORCE WITH FORCE CAN WE WIN BACK OUR MOTHERLAND

We have tried every way to reason with the white supremacists. For many years our leaders and organizations sent petitions and deputations to Cape Town and Pretoria, even overseas, to London and the United Nations in New York. We organised mass demonstrations, pass-burnings, peaceful stay-at-homes.

What answer was given by the government?

Strikers and demonstrators were shot in cold blood. New acts of oppression and injustice were heaped upon us. Our leaders and spokesmen were banned, gagged, jailed, banished—even murdered. Our organisation, the African National Congress, was outlawed. Our meetings, journals and leaflets were prohibited.

The Nazi Vorster, who was interned for helping Hitler, is now the Prime Minister of South Africa. This man is the murderer of Mini, Mkaba, Khayingo, Bongco, Saloojee and other brave sons of Africa. He has condemned Mandela, Sisulu, Mbeki, Mhlaba, Motsoaledi, Mlangeni, Kathrada, Fischer and many others to rot away in jails for life.

They have declared war on us. We have to fight back!

Our *Indian* brothers know full well the hardships and bitterness of white baaskaap rule. Since the time of Mahatma Ghandi and before, they have had to face persecution—attempts to deport them to India, Ghetto Acts, Group Areas and other forms of oppression.

The South African Indian Congress fought back. Led by men like Yusuf Dadoo, Monty Naicker and Nana Sita, the Indian community marched hand in hand with the ANC for liberty, for the rights of all South Africans.

Our *Coloured* brothers know how even the few privileges they were allowed—crumbs from the master's table—have been taken away from them. Votes, skilled jobs, trade union rights—one by one they are being taken away. Now apartheid madness is conscripting the Coloured youth into labour camps and jails for pass offenders. The ghetto walls grow

higher. That is why the Coloured People's Congress (CPC) pledged its support to the Freedom Charter and why its leaders are driven into jail or exile.

And what of the *white* minority? For years they have been misled by racist politicians, domineers and fascists who told them they were the superior race. They have followed the Vorsters and the de Villiers Graffs, and now they are being called upon to fight and die in defence of apartheid. Let them ask themselves: is it worth it? Has it brought anything but uncertainty and fear, isolation and contempt at home and abroad. Is this a future to fight and die for—a life in an armed camp, surrounded by the hate and anger of the oppressed non-white people?

The African National Congress, remembering also the Bram Fischers and the Dennis Goldbergs, calls on white South Africans to take their place on the side of liberty and democracy, the side of our freedom fighters—now *before it is too late*.

WHAT WE FIGHT FOR

We are fighting for democracy—majority rule—the right of the Africans to rule Africa. We are fighting for a South Africa in which there will be peace and harmony and equal rights for all people.

We are not racists, as the white oppressors are. The African National Congress has a message of freedom for all who live in our country.

WHAT YOU SHOULD DO

The battle has begun.

In Rhodesia, we have met the oppressors with guns in our hands! That was the start. Soon there will be battles in South Africa.

We will speak to them with guns, again and again, now here, now there, until their day is done and apartheid destroyed for ever.

We call on you to be prepared.

Stand up and speak out against Vorster and his Nazis. Don't collaborate with them! Take courage from our immortal freedom-fighters who died in the name of freedom for all.

Our country will be free. We fight for all South Africans, for you and your children and your children's children.

PREPARE TO SUPPORT OUR FIGHTING MEN!

Pass this message to your friends and relatives, throughout Southern Africa—in Botswana, Lesotho, South-West Africa, or Swaziland; in Rhodesia, Mozambique or Angola, and in every corner of South Africa, itself.

HELP THE FREEDOM FIGHTERS!

MAKE THEIR PATH EASY! Make the enemy's path hard!

WE ARE ANSWERING THE WHITE OPPRESSORS IN THE LANGUAGE THEY HAVE CHOSEN! THIS IS A WAR TO

DESTROY APARTHEID, TO WIN BACK OUR COUNTRY FOR
ALL OUR PEOPLE!

WE SHALL WIN! FORWARD TO VICTORY OR DEATH!
AFRIKA! MAYIBUYE! AMANDLA NGAWETHU!
MATLA KE ARONA! POWER TO THE PEOPLE!

Insurgent Methods

COMMUNICATION OF IDEAS*

BY DOUGLAS PIKE

Successful insurgent movements are usually characterized by effective communications with the indigenous population. The Viet Cong employed a broad, highly sophisticated concept of social communication.

The three basic means by which ideas are more or less systematically communicated are mass media, such as radio, television, newspapers, magazines, books;¹ the so-called informal channels of communication—word of mouth, rumor, gossip, itinerant peddlers; and social movements or social organizations, in which the organization itself—for example, a church or the Boy Scouts—acts as the channel, communicating not only ideas but also facts, data, and value judgments. The NLF used all three but relied on the third, the social movement, as its chief medium of communication. It is with this phenomenon, together with one other Communist communication device—the agit-prop cadre—that we are chiefly concerned here.

In a sense it is false and misleading to treat the NLF's communication effort as a separate entity. In truth, almost every act of the NLF was conceived as an act of communication. Its use of the communication matrix went beyond the normal social role as understood elsewhere. Its communication system not only communicated information, explained it in meaningful terms, and provided it with a value judgment based on individual relevancy—the more or less traditional communication function—but it also shaped a communication weapon and used it to strike at the vitals of the GVN. Its victories and defeats were essentially the result of successful or unsuccessful communication efforts.

THEORY OF COMMUNICATION

The general characteristics of the NLF communication process were these:

1. The specially created social movements, such as the various liberation associations, became the primary vehicles for communication. Their activities were managed directly or indirectly by the agit-prop cadres and workers using both traditional channels, such as word-of-mouth and

*Excerpts from "Communication of Ideas," Chapter 7, in *Viet Cong: The Organization and Techniques of the National Liberation Front of South Vietnam*, M.I.T. Press, Cambridge, Mass., 1966. Reprinted with the permission of M.I.T. Press, copyright holder.

face-to-face communication, and mass media, the latter chiefly designed as a reinforcement.

2. Using this *apparat*, a theoretical formula was employed that first established a claim to truth in terms of basically rational appeals. This was not a full-blown ideology, Marxism or any other, so much as it was the conversion of specific ideas into actions and the transformation of abstract concepts such as nationalism into social levers. Second, using nonrational appeals, the emotions of the villagers were tapped, and passions, chiefly hatred, were generated. Third, a commitment to action was demanded, even if only a token act or gesture.

3. The Communist concept of communication predominated, with the Chinese rather than the Soviet experience serving as the model. As in China, great premium was placed on mass psychological techniques such as rallies, demonstrations, parades, movements (similar to China's "Back to the Countryside" movement), group criticism and individual denunciation campaigns, neighborhood and work meetings, and other forms of organizational communication, often with the mass social organizations acting as media.

4. The communication of ideas was viewed not as a separate act but as an integral part of the Revolution; communication was a seamless web. It was based on the orthodox Communist distinction between agitation and propaganda, derived from the famous Plekhanov (and Lenin) distinction between an agitator as one who presents only one or a few ideas to a mass of people and a propagandist as one who presents many ideas to one or a few persons; this approach was necessary, it was held, because the masses could not be expected to understand Marxism-Leninism but nevertheless must be imbued with the proper spirit so that they would work and sacrifice for the cause. Propaganda thus consisted of theoretical indoctrination through which Party members were armed with scientific knowledge of the laws that govern society, or almost the exact opposite meaning of the word as used in non-Communist countries. In functional terms, agit-prop² activities were conceived as a servo-mechanism by means of which the rural Vietnamese were indoctrinated with a certain set of values and beliefs as the necessary first step, the formation of the masses into an organizational weapon. It was often reiterated in internal documents, as in the following PRP statement:

Agit-prop work is directed at the masses, for the benefit of the masses, and must involve the masses doing propaganda work under Party guidance. Thus the propaganda target is the masses, and the propaganda force is also the masses, but in the second case the masses are organized and educated by the Party, in associations, groups, organizations, etc. . . .

5. Although communication efforts were conducted simultaneously on various levels and with differing and often contradictory themes, the key communicator at all levels was the agit-prop cadre. He was no mere technician but one who sat at the highest policy determining levels and who at the lower echelons tended to dominate all activities, not just

agit-prop work. He was regarded as an instructor who explained NLF policies and programs in terms the ordinary rural Vietnamese could understand, using whatever arguments seemed most likely to be effective. Mass media, where they did exist, were never regarded as strong enough in themselves to convince the unconvinced.

6. Although the successes of the communication program were not due to its Marxist content so much as to its pragmatic arguments, the appeals were rooted in fundamental Communist doctrine: the united-front concept, class consciousness, and the historically determined inevitable triumph of the cause. Contamination of the communication system was reduced by requiring cadres to use Radio Liberation and Radio Hanoi as basic sources of material and by postcommunication audits at higher levels.

7. The NLF communication system suffered from standard Communist communication weaknesses: obtuseness, formalism, irrelevancy, and ultraconformity.

This summary and the following sections on social movements as communication devices and on agit-prop work were taken from two key documents that fell into GVN hands in mid-1962. The first was an NLF document entitled *Directive on Information, Propaganda, Agitation, and Cultural Activities for 1961*. It was written at the Central Committee level for use at the provincial level and contained an analysis of GVN rural communications efforts, an assessment of the rural climate of opinion, a critique of NLF communication efforts during 1961, and a master plan for its communication work during 1962. The second, a PRP document entitled *Training of Propaganda, Cultural and Educational Workers at the District and Village Levels*, was prepared for lower-echelon agit-prop cadres and dealt with specific agit-prop techniques and organization, the staffing of agit-prop and armed propaganda teams, and the use of culture and education (or indoctrination).

The first document was highly theoretical, the second concrete and practical. Taken together, they portrayed the full range of the NLF-PRP communication process; dozens of other documents, as well as more than 4,000 NLF propaganda leaflets subsequently collected, illustrated in detail the basic concepts outlined in the two major directives. Both documents stressed the importance of agit-prop work. The PRP cadre directive outlined it in specific terms:

Daily the masses are oppressed and exploited by the imperialists and feudalists and therefore are disposed to hate them and their crimes. But their hatred is not focused; it is diffuse. The masses think their lot is determined by fate. They do not see that they have been deprived of their rights. They do not understand the purpose and method of the Revolution. They do not have confidence in us. They swallow their hatred and resentment or resign themselves to enduring oppression and terror, or, if they do struggle, they do so in a weak and sporadic manner. For all these reasons agit-prop work is necessary to stir up the masses, to make them hate the enemy to a high degree, to make them understand their rights and the purpose and method of the Revolution, and to develop confidence in our capability. It is necessary to change the attitude of the masses from a passive one to a desire to struggle strongly, to take part more and more violently to win their rights for survival. Good or bad results in our Revolution depend on whether agit-prop action

to educate and change the thinking of the masses ³ is good or bad. Every person in the Revolution therefore must know how to conduct propaganda. It follows that the [agit-prop] task is a very important one. During the Resistance, this task made the armed struggle possible. At the present time, with our struggle movement approaching, it is the unique weapon the Party and the masses use to strike at the enemy. Therefore a Party member must, in all circumstances—even when he has fallen into enemy hands—continue by all means to make propaganda for the Party under the slogan “Each Party member is a propagandist.”

Explaining the difference in approach between efforts during the Viet Minh war and the later period, the document declared:

During the Resistance our struggle approach was to arm all the people and have them engage in guerrilla warfare. At that time we had a slogan, “Propaganda action is half the resistance work.” At the present time we pursue a political struggle combined with the armed struggle, which present to the world three faces: political struggle, armed struggle, and struggle among the enemy. . . . It is the present policy of the Party that after completing the indoctrination work in the Party, Youth League, and other mass-based revolutionary organizations, we begin to reach the masses by propaganda in depth, by meetings in hamlets and villages, word-of-mouth communication. In this, the first action is agit-prop work, . . . which serves two purposes: a means of persuading the masses to participate in the political struggle movement against the enemy and, second, it is a [propaganda] weapon we place in the hands of the masses in their political attack on the enemy. The masses themselves therefore must be trained in the use of propaganda arguments. What we must do is to influence public opinion so as to get the masses to stop the enemy and win over officials of the enemy administration and enemy troops.

The NLF Central Committee directive took a somewhat longer view:

In all phases of the Revolution, the Party's agit-prop effort is vital and must not be neglected. . . . Our programs and policies and our effort to develop Party leadership of the Revolution require that the Party make every effort to develop agit-prop potential and in this way develop and widen Party influence among the masses.

The end result of agit-prop activity, both documents clearly stated, was not to be passive belief or acceptance by the people but actions by them against the GVN in the form of propaganda activities, one of the several forms that the struggle movement could take. Said the NLF Central Committee directive:

If the masses take part in propaganda action it is because it will serve their interests. Because they want to keep their land, peasants persuade each other to take up the struggle. Because they want to protect their homes and property and fight against regrouping [i.e., relocating], the masses take up the *binh van* movement.

Again the PRP cadre directive was more specific:

Agit-prop cadres must get the masses to invent propaganda arguments to use during struggle movements. . . . The masses already have developed many slogans such as “Struggle against shelling and bombing,” . . . “Struggle against the strategic hamlet and agrovillage,” . . . “Struggle against conscription,” . . . “Struggle against looting,” . . . and “Americans get out.” During struggles, the masses themselves have invented many other arguments to deal with the enemy and stop terrorism.

The importance of agit-prop work was outlined succinctly in a document issued a year later by the Long An province central committee:

It helps the masses understand the Party's programs and policies. . . , assists in unmasking the U.S.-Diem plot to keep the masses poor and miserable, and helps them realize their condition is not due to their bad luck or ignorance, and thus causes the masses to hate the enemy and to sacrifice for the Revolution. . . . It promotes unity and helps organize the people in the struggle. . . .

THE SOCIAL MOVEMENT AS COMMUNICATION CHANNEL

With the social organization as a communication device we reach the heart and the power of the NLF. Here lay the solution to the mystery that for so long puzzled knowledgeable and thinking Americans: How could the NLF achieve success in the face of overwhelming GVN military superiority and massive inputs of American material resources for civic action programs to alleviate economic grievances? Not superior ideology, not more dedicated personnel, not because voluntary support of the villager had been won, but the social movement shaped into a self-contained, self-supporting channel of communication—that was the NLF's secret weapon.

Working from the fundamental assumption that if an idea could be rooted in the group it would become strong, durable, and infinitely more difficult to counter, the NLF created a communication structure far beyond any simple propaganda organization and plunged to depths far below mere surface acceptance of a message by an individual. In the hands of the agit-prop cadres the social movement as a communicational device made these contributions to the NLF cause:

1. It generated a sense of community, first, by developing a pattern of political thought and behavior appropriate to the social problems of the rural Vietnamese village in the midst of sharp social change and, second, by providing a basis for group action that allowed the individual villager to see that his own efforts could have meaning and effect.

2. As an organizational armature, it mobilized the people, generating discontent where it did not exist, exacerbating and harnessing it where it did, and increasing especially at the village level the saliency of all the NLF appeals.

3. It altered to at least some degree the villager's information input, perception of the world, attitude toward government, and daily actions in and out of the village. It changed underlying beliefs and even caused villagers to do things to their own disadvantage.

4. In a self-reinforcing manner it fostered integration of the NLF belief system, turning heterogeneous attitudes into homogeneous ones; the social facilitation or interstimulation that resulted canalized and intensified village feelings, reactions, and aims. Thus even when the NLF organization turned coercive as it finally did, members continued to hold imported and alien values and norms.

5. It greatly facilitated the NLF's efforts to polarize beliefs, stereotype anti-NLF forces, and generally shift villagers' attention in the directions chosen by the NLF leadership. As does any social organization, it caused the villager to rationalize more easily, being influenced by those around him. Since resistance to suggestion, that is, critical judgment, is lower within a group, it caused him to accept spurious arguments more easily and to succumb more quickly to emotional or personal appeals by the cadres and the village NLF leaders. Once critical judgment was impaired, the villager soon came to confuse desire with conviction.

6. Once momentum in the group was developed, the group itself tended to restrict freedom of expression to the sentiments acceptable, to the NLF-created group norms. The individual became submerged, the group became the unit, and great social pressure was brought to bear against the deviant, thus achieving the ultimate NLF objective—a self-regulating, self-perpetuating revolutionary force.

7. Finally, because it helped cut social interaction and communication with the social system represented by the GVN, it isolated the villagers and heightened the sense of conflict between the two systems.

The significance of the social movement as a communicational device and the contribution it made to the NLF effort cannot be stated too strongly. Its essential importance was clearly grasped by the NLF from the earliest days, the result of lessons learned in the Viet Minh war. A 1961 document declared:

An enlightened people if unorganized cannot be a force to deal with the enemy. . . . Therefore organization of the masses is essential, it facilitates our cause in all ways. . . . The [social movement] provides a strong force to oppose the enemy, it makes the Party's task much easier, [and] it both provides an audience for the agit-prop cadre and facilitates further agit-prop work. The [social movement] is a measure of our physical and moral strength, it is a practical way of both serving the people's interests and guaranteeing Party leadership among the people, it is the decisive element in the Revolution.

What the NLF leadership realized—and was all too poorly understood in the United States—was that social organizations are especially potent communication devices in underdeveloped countries. Yet the process is in no way alien to Americans, with their proclivity for the voluntary organization. The Boy Scout movement, for example, transmits and inculcates a whole complex of beliefs, the scope of which is indicated by the twelve Scout laws. A college fraternity can heavily indoctrinate an impressionable youth, shape his political beliefs and economic values, even dictate what sort of a wife to choose. This is done not as a premeditated brain-washing scheme but simply as a by-product function of the organizational essence or nature of its being. What the NLF did was deliberately to create such an organizational structure specifically to transmit information, data, ideals, beliefs, and values.

THE AGIT-PROP TEAM

The Communist institution of the agit-prop cadre is generally well known but little understood by Americans. Its utility to the NLF was so great that it has been singled out from other communication methods for special consideration here. Let us begin by inspecting the visit of a hypothetical NLF agit-prop team to a Vietnamese village.

The team approaches in late afternoon and has a rendezvous outside the hamlet with a Party member or sympathizer who carefully briefs it on developments in the village or hamlet since the team's last visit; he lists the local grievances, local animosities, the most disliked persons in the village.

At dusk the team enters the hamlet with a great deal of fanfare,

shaking hands, greeting people, carrying with it an aura of excitement, a break in the village monotony. Villagers are asked to assemble voluntarily at some central location. One old man, known to be irascible and intractable, announces loudly he'll be damned if he'll listen to a bunch of agitators. The team chief ostentatiously excuses him. However, should a sizable number of villagers indicate reluctance to attend, the team chief grows stern and indicates by gesture and manner that it would be well to give the members of the Revolution at least an opportunity to present their message. So the villagers gather.

The session begins with a short talk by the team chief in which he mixes flattery of the villagers' spirit, sympathy for their plight, and the hint that he will present later a message of great importance.

An interlude of singing and quasi-entertainment follows. The team chief or one of the members leads the villagers in a traditional folk song known and loved by all South Vietnamese. When it ends, the song leader announces that he has written new words to the old melody that he would like to teach the villagers. He recites the verse, which carries a class consciousness and revolutionary message, and after the villagers learn the words, he leads them through it several times.

Then comes the main speech, lasting up to an hour. The team chief has previously received from the interzone agit-prop section a directive outlining current themes to be stressed; they are biological warfare and cholera in an anti-American context. These are carefully fixed to local grievances. He tells the villagers: "Your harvest this year was not so large as in years past. The reason for this is that the Americans are conducting in South Vietnam something called defoliation. Strange chemicals are sprayed from airplanes, killing crops and foliage instantly. It is true that no planes have been seen, for none has sprayed within fifty kilometers of the village. But these chemicals can be carried vast distances, even halfway around the world, by the wind. What has happened is that some of the noxious chemicals have drifted over the village and fallen on the crops, stunting their growth and causing a lower yield." It is also believed by the villagers that there is cholera in the village. "This isn't really cholera but a germ disease for which there is no cure, also spread by the Americans." He continues to recite local fears, grievances, and problems, ascribing them all to some action by the Americans or officials in Saigon. He recounts atrocities committed in nearby areas. As a closer, he tells the villagers that the only way they can fight this injustice, the only way they can survive, in fact, is to join with the NLF and work for a General Uprising, after which there will be peace, economic abundance, and freedom for all.

The general meeting breaks up and the submeetings begin. The farmers gather to be addressed by the team's Farmers' Liberation Association representative, women by the Women's Liberation Association representative, and the youth by the Youth Liberation Association representative. In these meetings appeals are further refined and pin-

pointed, and a theme employed in one group is often inconsistent with one employed in another. For example, farmers are told that all the NLF asks from them is a small financial donation; the women are told the NLF army will protect their village and provide complete security; the youths may be urged to enlist in the NLF army and may be told that they must be prepared to sacrifice even their lives for the Revolution.

The villagers then reassemble in a large meeting that becomes participational. Questions are solicited, including those critical of the NLF. The team chief, a master at handling the barbed comment or loaded question, handles these with ease. Some questions may be fed him by covert Party members living in the village.

In the midst of this question period the team chief, in a demonstration of omniscience, casually remarks that he knows there are enemy agents in the group. He points to Mr. Ba and says "I know he is an enemy agent and will report to the village chief tomorrow about this meeting." The villagers know this is true. But the team chief takes no action against Mr. Ba and simply goes on with the meeting.

Then comes the *pièce de résistance*, a dramatic skit presented by the team. It is a highly entertaining little drama set in Saigon, involving a taxi driver played by the team chief, a Vietnamese girl played by the woman team member, and an American played by another team member. The American accosts the young girl and makes an indecent proposal that is overheard by the taxi driver, who comes to her rescue. There is a lengthy dialogue between the taxi driver and the American—full of double entendres and ribald remarks at the expense of the American, which delights the villagers. The drama becomes a verbal contest between the Vietnamese and the American, and the American is thoroughly confused, deflated, shattered, and defeated. The taxi driver and the girl go off together.

Then the team departs, scattering leaflets in its wake or pasting them to trees and walls, and it hoists and NLF flag.

THE AGIT-PROP CADRE

Agit-prop activity rested on the fundamental NLF assumption that the personal intermediary was the most potent form of communication. On the agit-prop, he was constantly told, rested the burden of the Revolution. A steady flow of messages from higher headquarters constantly reminded him of the complexity of his task and the high degree of skill that he must employ daily, for the NLF knew what all professional communicators know: that the simple communication of facts is often ineffectual in changing men's opinions, majority opinion reinforced by social pressure counts for much more than expert opinion or leadership assertions, and people tend to misinterpret what they hear or read to suit their own preconceptions. And the NLF knew that, working within such complexities, technique counted for all.

Next to technique, the personality of the individual agit-prop cadre was

of chief importance. The ideal cadre was a model of dedication, sobriety, skillfulness.⁴ Agit-prop cadres were chosen, a directive noted, "from among those who have a clean past, who are virtuous in behavior, and who known how to arouse the masses".⁵

The previously cited Central Committee directive listed the duties of the agit-prop cadres in a general way:

To direct the masses toward political struggle, armed struggle, or action among troops [by] directing the thinking of the masses toward the Revolution; to arouse hatred for the enemy in the masses and at the same time to enlighten them about their interests; to consolidate their faith and generate revolutionary enthusiasm.

The cadre directive listed his duties specifically as to:

(1) promote hatred of the enemy; (2) show the people it is in their interest to support the Revolution, for it serves them; (3) teach the people the meaning and techniques of the political struggle ...; (4) develop the people's faith and self-confidence in achieving revolutionary successes and maintain their enthusiasm.

As GVN battlefield interdiction began to take a heavy toll among agit-prop cadres and as the NLF grew in size, increased numbers of cadres were required, and infiltration by Northern-trained agit-prop cadres increased. Several of those who were captured gave interrogators a word picture of the training they had received in the North. It consisted of two parts: a session in political indoctrination and one in agit-prop techniques. The first, usually lasting two weeks, involved indoctrination in these major subjects: the world-wide advance of communism; socioeconomic progress being made in the DRV; the role of youth, a chief target in the task of building socialism and of liberating the South; the sociopolitical situation in the South; and the NLF and its successes. At the end of this period the inept were weeded out and final selection of infiltrators made. The remaining group then received about ten days of further training in the specific techniques of agit-prop work.

The outer limits of accomplishment of the agit-prop cadres, in objective terms, appeared to be these: At best they hoped to shape villager opinion to such a degree that the villager would support the cause of his own volition; the least they tried to do, when greater achievement was not possible, was to confuse the opinions and emotions of the villager so that he became indecisive and thus ineffectual in providing support to the GVN. Within this range the agit-prop cadres sought to instigate strife along class lines. They dealt in misinformation, exaggeration, and distortion. They concealed or misstated Communist intentions. They drew attention to and inflated real or trumped-up village grievances.

Woolly-mindedness and lack of specificity were the major short-comings of the cadres, who were instructed to allow their work to grow naturally out of the exigencies of the moment. Cadres were instructed to

study and understand both technique and policy. . . . Good technique does not consist of collecting materials about our policies and programs and then giving a "certified copy" to the masses. Neither does it mean picking up a megaphone and explaining general policies in a general way. It means ceaseless effort and taking detailed care to persuade the masses, to clarify their thinking. . . . Many cadres simply distribute slogans, and the result is that the masses know the slogans but do not know what actions to take.

Specificity of theme directed toward specific social elements was also stressed:

Among poor peasants it is necessary to stress the class-conflict viewpoint . . . Among middle-class peasants, stress our agrarian policies, that peasants will be owners of land and rice fields. . . . Among religious groups, show how the Revolution will bring them concrete benefits in the form of religious freedom, and at the same time create class consciousness and strengthen the revolutionary struggle. . . . Among the intermediate classes, those between the worker-peasant class and the petite bourgeoisie and bourgeoisie, according to individual and group understanding about the NLF and the Party, conduct clever agitation to widen the Front and Party influence; for instance, stress and emphasize the just and correct policies of the Front and the Party. . . . Among the masses, popularize the Front and Party plans and programs, the successes scored in socialist and Communist countries. . . . When the enemy talks about famine in North Vietnam do not deny there is famine but talk about the unending increases in food production in the North. The enemy will say the Communists are bloodthirsty dictators. We should point to their crimes. . . . Maintain the upper hand in counterpropaganda. Meet the enemy's anticommunism charges by promoting class consciousness through the *dan van* movement.

An agit-prop cadre could operate in a team or alone. In the latter case he was told to

take every opportunity for agitation. . . . On a busy train, in a bar, at a private party, make the subject lively and raise the level of the class consciousness of the individuals present according to the circumstances. . . . But be careful not to reveal yourself and avoid talking too much. . . . Here is a good example: Take a newspaper that carries a story about a certain man named A who committed suicide because he was unable to find a job. Bring up the subject of the newspaper story and then lead the conversation to the general subject of jobs, unemployment, the difficulties of earning a living, etc. In this way people are invited to complain about the hardships they face. From this seek an opportunity to incriminate American aid as a source of this state of unemployment and starvation.

Also commonly employed in the earlier days was the "root-and link" device. A Party member looked for a prospective "root" whom he would meet, talk with, and win over, after which he would educate him. This root then became a "link" who looked for other roots, and thus a "chain" was formed. This did not necessarily involve Party membership or any form of formal organization. It was a transmission belt for propaganda, highly directed, specifically oriented, and very personal. The root-and-link device was an effort to make use of traditional channels of communication. NLF output referred to it and similar devices as word-of-mouth propaganda, which it described as:

the principal medium of both covert and overt propaganda. It is direct. It enables us to present our views clearly and to understand immediately the response of the individual. We can by this means offer on the spot a solution to his problems and at the same time mobilize thinking.

Agit-prop teams also employed a vast number of psychological tricks, of which the following is an example. After the important NLF victory at Ap Bac in 1963, guerrilla units moving away from the battlefield passed through villages carrying, on a stretcher-like affair, a bulky item covered by a huge blue cloth. The band would stop for water in a village and the four bearers of the cloth-covered apparatus would set it down without comment. Villagers would gather around and exhibit curiosity about what was under the cloth. The guerrilla leader warned them not to get

near it. Then, as their curiosity reached the bursting point, the leader would say: "Under this blue cloth is a new secret weapon. By means of it we shot down dozens and dozens of the enemy's helicopters at Ap Bac." The band would then finish its marching break, the four bearers would pick up the device, still covered by the blue cloth, and depart. Other techniques employed by agit-props included those that piqued the Vietnamese sense of humor:

It is possible to use riddles during such events [the incident that the agit-prop cadre is capitalizing on], such as this one we used in the [1960] presidential elections: "The head is fascist. The rear is colonialist. The hands and feet are feudalist. The mouth is republican. What is it? (Answer: Diem)." Once these have been devised it is necessary to spread them to the towns and cities. . . . Ask [loaded] questions of the administration authorities or of soldiers and officers. One can pretend to be an ignorant farmer and ask an army officer in the market place: "What exactly have the people of Binh Ninh done to cause the killing of so many of them?" This technique can also be used in the *binh van* movement.

The individual behavior of the agit-prop cadres received close supervisory attention by the leadership, for the cadre was the NLF representative most often seen by the villagers, and their opinion of him to a great degree determined their attitude toward the more abstract aspects of the NLF.

NOTES

¹ See the author's monograph *Viet Cong Communication Techniques* (Cambridge, Mass.: Massachusetts Institute of Technology, Center for International Studies, 1966; No. C/66-11), which treats in some detail the methods employed by the NLF in communicating its ideas. For a much shorter version of this monograph see the author's *Vietnam: Communication Factors of Revolutionary Guerrilla War* (Cambridge, Mass.: Massachusetts Institute of Technology, Center for International Studies, 1965; No. C/65-16).

² Originally the standard term for agit-prop in Vietnamese was *tuyen huan*, a contraction of *tuyen truyen*, meaning propaganda, and *huan luyen*, literally, training, but more precisely agitation in the Communist sense. Beginning in mid-1962 the NLF started using the term *tuyen van giao*, usually abbreviated as TVG, a contraction of *tuyen truyen* (propaganda), *van nghe* (meaning culture or letters and arts or literature and the fine arts, similar to the French *beaux arts et belles lettres* or *la littérature et les beaux arts*, but with a Confucian literary overtone), and *giao duc* (meaning education or, in the Marxist sense, indoctrination). After mid-1962 the NLF generally employed the TVG term, and the GVN continued to refer to these activities as *tuyen huan*, or agit-prop; at the same time the NLF continued to use the term *chinh tri* (political) *tuyen truyen* or, roughly, political propaganda. The significant difference is that TVG referred to communication activities within the NLF system, the liberated area, and among the masses, and *chinh tri tuyen truyen* connoted activities directed against the GVN. In order to maintain this distinction, the only important one to the reader, and to simplify reference as much as possible, the term agit-prop is used here to mean cadre TVG activities and the word propaganda by itself to mean those mass activities that are part of the struggle movement and designed to influence the enemy. Since at the lower echelons virtually all communication activity was in the hands of a single individual, the agit-prop (or TVG) cadre, this oversimplification of usage cannot be regarded as particularly serious. What must be borne in mind, however, is the distinction between the *agit-prop* (or TVG) work by the cadres seeking to motivate the masses and the *propaganda* work by the masses themselves as part of their struggle movement.

³ In Vietnamese, *chuan bi nhan tam*, literally, "preparing man's heart": to prepare the people for the coming drive, that is, to shape public opinion or win people's support.

⁴ A cadre directive noted that "the purpose [of agit-prop work] is to mobilize the people's thinking. This is an ideological struggle that is complex and hard to carry out. It requires

time and painstaking efforts. A cadre should be patient, should follow up on each individual, and should repeat the same theme over and over. He should endeavor ceaselessly. He should build durable support and should not become discouraged. He should set an example for the masses, for unless we do how can we expect the masses to follow us? . . . He should behave modestly, listen to the people talk. . . . He should be humble. . . ."

⁵ The best cadres, it added, are those who "ceaselessly study [Party] directives and policies, consolidate their thinking, and improve their virtuous revolutionary behavior. At the same time they remain humble and listen to the judgment of the masses. . . . Cadres not only must know programs and policies but also must feel hatred when they witness killings and oppression of the masses. They must know the secret thoughts and interests of the masses, must share their joys and sadness, must be determined to work for the good of the masses, and must make every effort to influence the masses. They must suffer the hardships of the masses, for only in this way can they feel the suffering and sorrows of the masses. If cadres lack feeling, their propaganda will be emotionless and will not arouse the masses. Above all, . . . cadres must accept responsibility for the words they speak."

PSYOP (con't)

- Chinese (Republic of China), 463, 1105-1110
 - as communication, 22
 - comparison of U.S. and Soviet, 9, 848-854
 - in counterinsurgencies, 370-379, 446
 - in the Cuban missile crisis, 178-181, 259-261, 386-391
 - definitions of, 40-47, 69
 - in Dominican Republic, 229-232, 262-266
 - in the era of national liberation wars (post-1960), 10-11, 69, 149-154, 397-400
 - evolution of, 2-13
 - French, 234-241, 248-259
 - in Cameroon, 234-241
 - in Hungarian uprising, 382-386
 - importance of systematic research to, 479
 - in insurgencies (*see also* PSYOP in the era of national liberation wars), 149-154, 183, 220-228, 234-241, 397-400, 454-457, 465-471, 1130-1141
 - in Korean War, 7, 82-83, 412-413, 518-534
 - lack of definition, 2
 - in Laos, 1119-1120
 - in Lebanon intervention, 241-246, 380-382, 714-715
 - in Malaya, 73, 370-380
 - Nazi, 1030-1043
 - as "new diplomacy," 8, 14(n19)
 - in the Nigeria-Biafra War, 191-194, 702-711
 - NLF (National Liberation Front-Vietnam), 680-682, 716-717, 750-753, 1117, 1152-1163
 - in a non-war/limited war, 419, 439-471
 - North Korean, 532-534
 - North Vietnamese (*see also* PSYOP, Viet Cong), 403-407, 537-545, 1115-1119
 - in the Philippines, 73, 401-403, 440-454, 767-770
 - in Portuguese Guinea, 1130-1141
 - role of in military, 67-74
 - South African, 1122-1130
 - South Vietnamese, 460-465
 - Soviet, 8-9, 41-43, 346-353, 672, 676-678, 711-713, 1029-1050, 1090-1105
 - directed toward the PRC, 1100-1105
 - and ideology, 1090-1100
 - by Special Forces in S.E. Asia, 337-340
 - strategic, 362-400
 - strategic and tactical, 420-471
 - tactical, 400-420
 - use of force and, 422-424
 - U.S. in general, 27, 49, 151-153, 720-721
 - deficiencies of, 11-12, 113-114, 684-687
 - future of, 12, 732-735
 - Soviet view of, 823-829
 - Viet Cong (*see also* PSYOP, North Vietnamese), 131-132, 150-152, 345, 397-400, 536-545, 680-683, 996-1002
 - Viet Minh, 253, 398
 - in Vietnam, 130-132, 134-144, 150-154, 220-228, 397-400, 403-411, 413-416, 684-687, 730-735, 898-913, 946-951, 996-1002
 - location of PSYOP units in, 224 (map)
 - organization of, 220-225, 222 (fig.), 246-248
 - in World War I, 4-5, 14(n9), 68, 673
 - in World War II, 5-6, 83, 672-673, 678-679, 763-765
 - World War II to Korean War, 7, 41, 50, 81-82, 407-408

PREFACE

This report covers in summary fashion the major developments during the past six years on that broad politico-military area of national policy which has been variously identified as propaganda, psychological warfare, or psychological operations. The subject matter has never been officially defined and there are almost as many diverse definitions as there are specialists and agencies in the field. The present study intentionally avoids any attempt at definition and uses these words in interchangeable fashion without any subtle distinctions or nuances.

The time factor necessitated serious restrictions on this study. Greater attention might have been given to the psychological elements influencing economic decisions. There was not time, however, to pursue this virgin research. Because the research could not be extensive and penetrating, many statements in the text have been so generalized as to be somewhat platitudinous. The treatment of attitudinal developments in State Department particularly suffers from these generalizations which must be made from lack of detailed evidence.

No conclusions are drawn in this study. The research is not sufficiently complete to substantiate worthwhile judgments. Conclusions also have an undue tendency to persuade and influence the rapid reader or the operator who seeks the short road to a knowledge of psychological activities. There is no such easy road to understand psychological operations and the more one reads on this subject, the sooner its complexities and intangibles will be appreciated. Perhaps then, progress in the field will be expected.

Even this rapid survey would have been impossible had it not been for the gracious and wholehearted assistance provided by the many who contributed to this study. The author is deeply grateful to the Staff of the

PART I. WAR EXPERIENCES AND LIQUIDATIONS

The Psychological Strategy Board did not, like Minerva, spring unheralded into full-blown existence. The Psychological Strategy Board (hereinafter identified as PSB), established by the Presidential directive of 4 April 1951, was one action in a long series of psychological activities and it takes on perspective only with a knowledge of the previous efforts. The PSB may in one sense be a new development in American policy and yet this newness may be more apparent than real. Nations have always waged war, and they have also tried peaceful means to gain their national objectives. Even as they fought, the belligerents undertook non-military activity to influence and weaken the enemy's will so that victory could be more rapidly attained. Whether it was the Romans, the Saracens, Ghengis Khan, the American Continental Congress of 1776, or the Allies of 1917-1918, threats, rumors, enticing statements, bribery and political stratagems were intentionally used to confuse and hamper the enemy's purposes, to weaken and lessen their resistance and to persuade the enemy population that they should stop fighting. Appeals to entice and keep one's allies were a pleasanter aspect of such psychological activity. A classical example during World War I of such a psychological maneuver was President Wilson's announcement of his "Fourteen Points" (January, 1918). This declaration, momentarily united and idealized the war effort of the American and Allied governments and peoples, offered the enemy a hopeful and desirable future as the alternative to the horrors of war and appealed to neutral opinion on a high moral tone. During 1918, American propagandists, in George Creel's Committee on Public Information, in the War Department's Psychologic Branch and in General Pershing's Intelligence Division, exploited Wilson's themes to enemy, ally and neutral

through wireless bulletins, news and feature stories, leaflets, maps, posters and pictures. Allied agencies, if not American, employed covert methods to get those ideas circulated within Germany. In World War I, such psychological activity contributed in major fashion to the disintegration of the Hapsburg Empire and accelerated, if it did not cause, the weakening of the German government which made the armistice necessary.

America gained quite an extensive propaganda experience in World War I. After the Armistice, however, America preferred to slough off its responsibilities. The wartime propaganda agencies were rapidly liquidated. Official reports enumerated accomplishments but did not attempt to evaluate effectiveness or difficulties. Then all was forgotten until 1941.^{1/} America desired to be left alone to amass wealth in the Twenties and to concentrate on its domestic depression and recovery programs during the Thirties. While domestic information facilities increased, especially radio broadcasting, and Americans became the most news-conscious people, they remained basically indifferent to world developments. The widespread acceptance of the economic interpretation of history and of life, together with the revisionist histories of World War I, caused the average American to view wars as profit and persuasion: bankers and munition makers reaped the profit and plied their fellow citizens and world opinion with appealing propaganda to increase their gains. Unaware that they were thereby being propagandized, Americans became isolationist and concomitantly developed a phobia against the very word "propaganda", as a horrid, sinister word, a really un-American word and activity.

These attitudes solidified in the Thirties, but some few Americans

became perturbed at Nazi Germany's use of psychological factors to control the German people and to threaten European security. By 1939, the Austrian, Czech and Polish incidents made clear that Hitler's regime was consciously using cajolery, bribery, threats both physical and moral, publicized use of force, diplomatic and economic measures, and a powerfully remilitarized Wehrmacht in accordance with a Nazi grand strategy. It was employing the psychological factor, overtly through its press service, its world covering shortwave broadcasting, and other controlled informational media, covertly through "fifth columnists", pan-Germanic groups, tourists and student groups and secret agents. When World War II started and especially with the fall of France (June 1940) and the aerial blitz and peace offensive against England, psychological warfare techniques became evident even to Americans. Some felt that only fire could fight fire; only American psychological warfare could counter and destroy Nazi psychological warfare. Such was the national hostility towards propaganda that official American action was long delayed.

America was engaged in a psychological war with the Nazis long before the nation became militarily involved. As early as 1939, Germany was waging psychological warfare in the United States, alternately cajoling or indirectly threatening, to prevent American aid to the Allies. Nazi economic and propaganda penetration of Latin America was a serious threat to our national security. Nazi conquest of France heightened the possibility that Latin America might fall into the Nazi power orbit. The United States had to act. Propaganda was still a horrid word, and the national administration in 1940 could not hope to establish an admitted propaganda agency. American psychological operations or opinion-influencing activities had to be cloaked in the subterfuge of agency titles. Unfortunately, the situation was never clarified and throughout the war, American propaganda was not officially admitted. America carried on informational activities. These semantics contributed to the endless discussions defining the agencies' functions and areas of activity, to their numerous inter-agency jurisdictional conflicts,

and to a suspiciously delimited and begrudged participation in the war effort. The very term "psychological warfare" was intentionally dreamed-up to conceal, and, although it has now been used in government circles for a decade, no agreed definition of the phrase as yet exists. Forgetting that America had used propaganda in every national emergency we confused ourselves, and weakened our psychological efforts to avoid arousing the national aversion to propaganda.

Because all Americans, Republicans and Democrats, agreed on hemispheric defense and Pan-Americanism, the Roosevelt administration could establish an agency to coordinate our defense activities in Latin America and to foster Latin American attitudes favorable to our objectives. There would not be partisan clamor if its propaganda aspects were properly concealed. In August 1940, Nelson A. Rockefeller was appointed as "Coordinator of Commercial and Cultural Relations Among the Latin American Republics" (hereinafter identified as CIAA). While the Rockefeller agency had economic, financial and commercial responsibilities in Latin America, its primary function was to employ all these instruments in conjunction with an extensive American information program so that the Latin Americans would recognize Axis success as a serious threat to their freedom. With such information Latin Americans would naturally join the United States in aiding the Western Allies against the Axis aggressors. This prime purpose of Rockefeller's CIAA had to be concealed in verbiage, lest the American people and the world suspect that the United States was engaging in that horrid activity - propaganda. 2/

Similarly, in mid-1941, with Lend-Lease, American Aid to Russia and American occupation of Iceland, it became necessary to establish another organization which would make clear to the people of Europe, that

is, to England and its Commonwealth, to the peoples in occupied areas, to the neutral nations, and even to the Axis powers, that the American policy favored the Allies and was opposed to the Axis. Because of the delicate domestic situation, the administration still could not openly speak of a propaganda agency to influence the opinions and actions of Europeans, although national policy required that all Europeans should clearly understand the basic American preference for an Allied victory. Hence, a Coordinator of Information, William Donovan, was appointed in July 1941, ostensibly to centralize the government's foreign intelligence. It was understood, however, by the President, the Bureau of the Budget and Donovan that COI would not only collect and evaluate intelligence, but that it would also operate an extensive foreign information service so that Europeans would interpret American views and policies most favorably to the Allied cause. Like Rockefeller's CIAA in Latin America, COI's developing informational activities throughout the Eastern Hemisphere (Europe and Asia) had to be cloaked in indefiniteness, if not actual secrecy.

Prior to our entrance into World War II, these two agencies increased the existing American information media in overseas areas. Being adequately serviced with American news, world opinion could not fail to cooperate with the United States in aiding the Allies and opposing the Axis. The agencies operated on the principle that American information programs were based on truth. Lies, deceit, and misinterpretations should not be a part of the American effort. This philosophy of truth continued throughout the war. In one sense, all propaganda is based on the truth since false propaganda is rapidly discovered and destroys the whole effort. The important but undetermined element, however, is the proportion of truth and the proportion of interpretation to be included in the information program. The information operators in COI and CIAA had to learn the distinction between straight news and an opinion-influencing program which would support

SECURITY INFORMATION
TOP SECRET

Page 9 of 95 pages

TOP SECRET
SECURITY INFORMATION

December 19, 1951

American war aims, increase Allied morale, and yet weaken the enemies's fighting spirit. Even after Pearl Harbor, American agencies refused to use the term "propaganda". Similarly, the term "political warfare" was unacceptable to American agencies because it was a traditionally British instrument and hence suspected by many Americans.. Therefore, American participants in overseas informational activities became habituated to the phrase "psychological warfare", as a cover term which was only vaguely understood or appreciated.

Although it remained undefined American psychological warfare did develop into an extensive wartime operation. Rockefeller's CIAA fed increased American information into Latin America, by shortwave radio and especially by increased use of the local Latin American information media. Local radio stations were persuaded or subsidized to carry unidentified American programs. Local newspapers, through CIAA's judicious supplying of limited newsprint and American advertising, used additional American materials. American residents and native Latin Americans were organized into local national committees to issue publications, news photos and magazines, to make speeches favorable to the United States and to provide a local group to answer all queries about the United States and its policy. COI increased its informational activities in the Eastern Hemisphere until, in June 1942, its functions were divided between the Office of War Information and the Office of Strategic Services.

This division did not indicate any increasing appreciation of psychological warfare; it was the confused domestic information program and the jurisdictional rivalries among the psychological warfare agencies which motivated the change. The Office of War Information (hereinafter OWI) (Executive Order No. 9286, 13 June 1942) would be responsible for keeping Americans as well as the people of the Eastern Hemisphere adequately informed about the American war effort. This combination of domestic and overseas activities in OWI made its operations more difficult. The military and the diplomats, fearing the OWI was only another publicity agency,

SECURITY INFORMATION
TOP SECRET

Page 10 of 95 pages

TOP SECRET
SECURITY INFORMATION

December 19, 1951

hesitated to give it classified items about future military operations or national policy. Newspapers and some Congressmen viewed all OWI activities as Administration publicity. Yet OWI was responsible for the development and execution of the overt, or the officially admitted, side of American psychological warfare. The Office of Strategic Services (hereinafter OSS), established by the President's military order of 13 June 1942, as an agency of the Joint Chiefs of Staff, was responsible for covert operations, i.e., those activities not attributable to the American Government. These three agencies, CIAA, OWI, and OSS, were the major organizations involved in American psychological warfare but the whole organizational picture was confused by the fact that the War Department had a Psychological Warfare Branch and the Navy had a Special Warfare Section (OP-16W). During 1942, there also was a Joint Psychological Warfare Committee in the JCS. Other agencies performing activities directly related to psychological warfare were: The Board of Economic Warfare, the Office of Censorship, the War Production Board and the Federal Communications Commission. Uncertainties about each agency's responsibilities in psychological warfare developed the innumerable jurisdictional conflicts among all these agencies and delayed effective planning and cooperation in this field.

Although coordinated planning was lacking, extensive psychological warfare operations developed. Shortwave radio broadcasts covered the world on a 24-hour a day basis employing some 40 languages. Transmitter coverage was increased from an original 11 to 36 powerful transmitters which were available in 1945. News photos, pictures, brochures and other publications, as well as specially spliced news reels, film documentaries and even full length feature movies were distributed to influence world opinion. Psychological warfare Divisions or Branches were gradually established in all the major combined and American theaters of operation to develop these activities in unison with military operations. At AFHQ and

SECURITY INFORMATION
TOP SECRET

Page 11 of 95 pages

TOP SECRET
SECURITY INFORMATION

December 19, 1951

SHAEF, these military psychological warfare units consisted of military and civilian personnel, both British and American. In strictly American theatres (i.e., SWPA, China, Cincpac-Cincpoa) only American civilian and military personnel composed the psychological warfare units.

These military units employed every technique developed by the civilian agencies and supplemented them with psychological warfare aimed directly at the enemy soldier. They initiated their own radio broadcasting facilities and programs. They used newspapers and other published media to influence populations in areas which had been occupied by the advancing Allies or to prepare enemy occupied areas for the Allied advance. These theatre units particularly emphasized airborne leaflets as the major instrument for weakening the enemy soldiers' will to fight. SHAEF, for example, saturated German occupied areas of Western Europe with over 5 billion leaflets. In the process, it developed a weekly newspaper especially prepared for German soldiers which was weekly distributed, by air. These papers became a feature which German soldiers expectantly awaited. By 1945 psychological warfare had become an accepted, if not well understood, instrument of the American war effort. Over 30,000 people were directly involved in its operations at home and in the theatres. Congress was appropriating funds for this activity at the rate of \$150,000,000 a year.

While extensive psychological warfare operations were developed by the civilian and military agencies, American psychological warfare planning was continuously characterized by improvisation. The journalistic concept that people be fed truthful news dominated American psychological warfare planning and this concept was never completely abandoned. Gradually, but never admittedly, its planners did interpret and slant details to obtain the most extensive overseas acceptance of the American view. Such planning was seriously hindered and limited by America's wartime policy of short-range propaganda goals: Unconditional surrender, the United

SECURITY INFORMATION
TOP SECRET

Page 12 of 95 pages

TOP SECRET
SECURITY INFORMATION

December 19, 1951

Nations and lasting world peace.

Planning was also hampered by the reluctance of the military and the diplomats to give the psychological planners any foreknowledge of future plans. This failure was partially justified on security considerations but the main reason was that the military and political policy makers felt that psychological warfare did not need positive knowledge of future policy. If current news or developing international tensions might endanger national policy, the military and political agencies would guide psychological warfare activities with negatives or vetoes. The State Department and JCS always maintained that they could veto any propaganda lines without offering any justification.

In overt activities, OWI's weekly directives supposedly set the tone and the policy lines for all American propaganda, although they were primarily attuned to radio and news operations. The theatre units, since these directives were not sent through military channels, looked upon these OWI directives merely as guidances. Rapid military communications were not available to OWI and its directives were so delayed that they were no longer operationally effective. It was only in mid-August 1945, as the Japanese were surrendering and then only because occupational problems worried the military, that JCS gave OWI directives an official status. This action provided OWI with a military channel of communication. JCS also directed theatre commanders to accept these directives as JCS approved policy. While much was accomplished operationally in psychological warfare and while military commanders, from Theatre to Divisional levels, acknowledged its value, the following quotation fairly and accurately summarizes America's psychological warfare effort in World War II:

The United States psychological warfare has a history of improvisation without central leadership, control or integration

SECURITY INFORMATION
TOP SECRET

SECURITY INFORMATION

December 19, 1951

with the other methods of obtaining national objectives ^{2/}

As V-E day passed and the final attack on Japan was in the making, psychological warfare appeared to be an accepted activity. Newspapers gave almost daily attention to leaflet and loudspeaker activities in combat. Congressmen and editors discussed its use to quicken Japanese surrender. The JCS considered the reestablishment of a psychological warfare committee. The Air Force, particularly the 20th, had gone all-out for it. Even the staid old departments, State and War, petitioned Congress not to cut OWI's funds for psychological warfare:

"This Department regards this work as an important and, indeed, at the present time, indispensable to the most effective conduct of American foreign affairs. Its liquidation would silence the Voice of America abroad at the very time when it is most necessary to get the American story told and the American policies understood among foreign peoples." ^{4/}

By June 1945, all top government officials were aware of psychological warfare and, if questioned, would have conceded that it had contributed to the more rapid termination of the war. However, herein lay one of its weaknesses and the seeds of its subsequent decline. Nobody could say precisely what psychological warfare had actually contributed. Broadcasts could be totalled, leaflets counted and the amount of pictures and printed verbiage amassed. No one, however, not even the psychological warriors, could say with any precision, much less prove, how it all had affected ally or enemy or what it contributed to the

winning of a particular battle or to the war. Psychological warfare was an intangible concept whose value and effectiveness was practically a matter of faith. Since it was considered "un-American", its inability to prove its worth was embarrassing.

America's psychological warfare effort in World War II, large and influential as it might have been, was permitted to fall off into practical non-existence when the Japanese war ended. A repetition of World War I dissolution and subsequent forgetfulness seemed to be in the making. In the summer of 1944, when the European war seemed to be rapidly ending, each agency did some thinking about its post-war status. OWI and CIAA discussed the post-war information needs of the United States with the newly appointed Assistant Secretary of State for Public And Cultural Relations. These discussions occurred mainly because of the personality (Archibald MacLeish) who was Assistant Secretary, rather than any wide-spread State Department acceptance of the importance of any government information program overseas. Expecting a long Japanese war and then a six-months liquidation period, State, OWI and CIAA felt that they had time to work out long-range transferral programs. Expectation was that State's Foreign Service would take over the information activities at the many outposts. The agencies would develop their long-range plans so that an eventual take-over by State would be easier. About the same time, OSS developed a proposal for a continuing central intelligence service, incorporating most OSS functions into a peacetime agency. Government agencies had asked for comments and the proposal merited attention and discussion even in the newspapers. Continued German resistance, and particularly the Ardennes offensive, postponed additional action. The information agencies so concentrated on the final defeat of Germany, and then of Japan, that post-war planning was practically ignored. The relatively surprising Japanese surrender

SECURITY INFORMATION

in mid-August, therefore, ended the fighting war before serious attention had been given to balanced planning on the post-war information needs of the American government.

In the subsequent liquidation of the American psychological warfare agencies, several factors must be mentioned as contributing to its apparent haste. The majority of the psychological warfare personnel were free-lance, creative and self-assertive individuals who might work in a government agency during wartime but who sought their individualistic professions when war ended. Feeling that they had done their bit, they rushed to get out of routine government operations. Secondly, during wartime it might be overlooked, but the traditional American hostility towards propaganda remained. When there is added the American post-war optimism that international relations would be an open exchange among the democratic nations, it is understandable that the psychological warfare agencies hesitated to invite possible Congressional and public hostility by suggesting the retention of government propaganda. Finally, the Administration desired to re-establish the government's peacetime basis as expeditiously as possible. The policy of the Budget Bureau might be summed up in the statement that the Administration did not want to eliminate clearly useful functions developed during the war. It was best, however, to liquidate rapidly those wartime activities which were not clearly demonstrable as necessary to the government's peacetime policy. These three factors--the personnel element, the fear of Congressional or public hostility, and the Administration's attitude on the government's peacetime structure--contributed to the hectic liquidation of the psychological warfare agencies.^{5/}

While CIAA and OWI visualized that their broadcasting and news functions would be incorporated into the State Department, few definite plans for the orderly incorporation of these functions had been developed by any of the agencies. When the Japanese announced their surrender, the war agencies were told to get their liquidation plans to the White House. Only by continuous conferences, the final one lasting 12 hours, was OWI able to get its liquidation plan into the White House within the three-day deadline. The Bureau of the Budget apparently had no definite plans regarding the psychological warfare agencies, and recommended that the President appoint a Committee of Three: John Snyder, Director of War Mobilization, Samuel Rossenman, Special Counsel, and Harold Smith, Director of the Budget, to study the problem and prepare the Executive Orders. Because there was uncertainty as to what information activities America really needed, an interim intelligence agency was proposed to continue the necessary intelligence functions and to commence the orderly liquidation of activities deemed unnecessary for a peaceful America. CIAA's and OWI's overseas activities were likewise to be combined in an independent Interim Information Office under the policy direction of the Assistant Secretary of State for Public Affairs. State and the information agencies were given four months to determine what functions and personnel should be retained or could be eliminated. On 31 August 1945, President Truman issued an Executive Order providing that OWI's domestic activities should cease on 15 October 1945 and that its overseas information activities, together with CIAA's, should be integrated into the Department of State by 31 December, or liquidated^{6/}

A similar directive was developed by the President's Committee of Three for terminating OSS. Except for secret intelligence, OSS's intelligence activities were to be integrated into the reorganized intelligence functions of the State Department. State Department did not want to handle the necessarily gradual liquidation of OSS's secret and covert operations. Other intelligence agencies had wanted secret intelligence files, if not its functions, to substantiate hostile criticism of civilian intelligence. To minimize conflict, a Strategic Services Unit was established under the Secretary of War to liquidate the unnecessary activities of OSS,^{7/} to maintain OSS's existent secret intelligence channels, and to keep the trained secret intelligence operators and analysts until adequate arrangements for secret intelligence could be determined.

The interim agencies established under the control of the State and War Departments tried to analyze the utility of their functions. The philosophy of keeping only the proven useful and desired budget reductions caused the elimination of activities which agency people thought, but could not prove, would be valuable in the post-war world. OSS's Morale Operation was considered too dangerous for peacetime American policy. Similarly, other secret operations necessary to wartime policy but not within the spirit of American peacetime international relations had to be liquidated. However, a few top personnel foresaw that even in peacetime, America might need some secret operations and so a cadre of the best secret operations people were slotted in secret intelligence positions with the assumption that they revive secret operations if necessary. ^{8/}

Other pressures were undercutting America's overt psychological operations. The American press associations, publishers, and motion picture distributors had permitted government agency operation in their overseas outlets during the war because as private enterprises they could not operate during wartime. With peace, the private informational media wanted to resume their own operations without competition or interference from a government agency. For example, the Associated Press and the United Press had been willing to provide their news files to OWI and CIAA and permit its uncontrolled transmission overseas as government news. At the end of 1945, however, they informed State's Interim Information Service (hereinafter IIS) that since peace was again established in the world, they could no longer contribute their service to a government unit which dangerously competed with their overseas commercial outlets. IIS was thereby cut off from a major news source, and it could only provide a textual service and editorial commentary from those newspapers which would permit such use. Similarly, elements in State Department sought the elimination of the all secret intelligence lest it threaten its position in the intelligence field. Much manipulation went on behind the scenes. Existing departments desired to do away with competing wartime activities. Simultaneously, a few far-seeing individuals in government and in private enterprise urged the retention of some activities as necessary adjuncts to a government which had become the world power.

The rapid liquidation of America's psychological warfare operation, which was practically completed by the end of 1945, was based on two uncertain factors: potential utility and adaptability to prospective national policy. The utility of psychological activities is an intangible on which many have opinions but no one has authority. Even in 1952, there are no certain means of determining its precise value and

SECURITY INFORMATION
TOP SECRET

Page 19 of 95 pages

in 1945, there was even a lack of interest in such evaluation. Hence the judgments in the liquidation process as to what activities would be retained were made on a rule of thumb or a personal basis. During the war, the information agencies had attempted to make operational evaluation of the audience appeal and technical receptivity of their programs. In theaters of operations, military psychological warfare units unsuccessfully attempted the public opinion poll technique to arrive at some estimate of the activity's worth. Similar efforts were sporadically made during the early occupation of enemy areas. People were asked if they had seen leaflets or had heard radio broadcasts. More importantly, but with less satisfactory results, the interviewee was asked what influence the item had on his attitude and actions. No formal reports of these evaluating efforts were ever made.

By unofficial pressures, two questions bearing on the effects of psychological warfare "snuck" into the Morale questionnaire, which was a small feature of the United States Strategic Bombing Survey of aerial war damage in Japan. No such questions were asked in the European survey. The report on Japanese Morale mentioned leaflets as a factor contributing to the weakening of enemy morale, but it made no serious evaluation of their contribution. The Propaganda Branch of the War Department made three distinct efforts in 1945-1946 to get authorization for a survey of the effectiveness of military psychological warfare. While such proposals were recommended on the highest General Staff levels, they were never approved on the Secretary's level. Interestingly, neither CWI nor OSS was willing to assign any liquidation funds to the completion of detailed histories which had been started. It was only by unofficial and personnel pressures that the JCS authorized and supported a "War Report" on OSS and a History of

Psychological Warfare.

The uncertainties of utility as a criterion for estimating what psychological activities should be continued into peacetime were matched by the indecisiveness of national policy as the world shifted from war and started the United Nations as the hope for world peace. The fighting was ended; the aggressive totalitarian nations had been vanquished. For Americans, the dawn of world-wide democratic, peaceful and cooperative international co-existence was in the making. The major problems were: reconstruction and rehabilitation of war-torn areas and the economic and political development of the backward or colonial areas so that eventually they would be self-governing participants in the international paradise.

In addition to support of the United Nations, America's major goal was to get along with the USSR which was viewed as a democracy, at least in potency. Concessions were made to the Russians to prove that the Western Powers would live up to their wartime agreements and did not favor a cordaine sanitairre. In this atmosphere, American policy makers considered that psychological warfare or the direct influencing of world opinion was inappropriate. World opinion was recognized as a major support of the United Nations but that opinion should be based on enlightenment through factual information.

The American position although probably never reduced to paper ran along these lines. If the world were given straight facts about American objectives and desires, men would necessarily recognize the cooperative position of the United States. If the United States adopted

varying techniques to influence world opinion in accordance with American objectives, other nations would be justified in using the same techniques to obtain their desired ends. The United States would set the good example, which the other nations would adopt voluntarily or through the force of world opinion. The unadulterated facts speak for themselves and are more acceptable to the common man than government opinion influencing efforts. America had no selfish post-war policies, and therefore we needed only channels to insure that all peoples knew the American policy. World opinion could not avoid favoring our position in most matters. The information program of the Department of State needed only sufficient machinery from OWI and CIAA to insure that the American viewpoint would be objectively and impartially presented throughout the world. American policy makers undoubtedly were aware that Russia and Britain were not limiting themselves to factual information but were continuing to issue propaganda supporting their national positions. American policy makers, at least in early 1946, seemed to feel that the United States should be above such measures. The great hope was that world opinion, like the American public, would develop an aversion to governmental propaganda.

With this attitude, the United States had practically liquidated its psychological activities by early 1946. The better qualified personnel had returned to their normal occupations. All covert operations had been abandoned and only overt information activity was uncertainly available. These overt psychological aspects existed without any clear delineation of their status or high level acceptance and support for their continued existence. The Office of International Information and Education of the Department of State retained its indefinite jurisdiction over thirty-six international shortwave transmitters in the United States, together with contractual relay arrangements with the British

SECURITY INFORMATION
TOP SECRET

Page 22 of 25 pages

TOP SECRET
SECURITY INFORMATION

December 19, 1951

Broadcasting Company and the group of relay transmitters in Algiers and in Manila. State also maintained a limited news service at each embassy where local United States Information Service tried to insure the distribution of American texts, editorial round-ups, occasional feature articles, newsphotos and news letters to the local molders of opinion.

State's information activity was seriously hampered, however, by two factors: the hostile Congressional attitude toward government information efforts and the indifference, if not hostility, of the career Foreign Service Officers to this unusual addition to their duties and responsibilities. Both factors were inherited from OWI and the State Department felt embarrassed by the continuance of an information service. Because it was an activity relatively new to Foreign Service personnel, it was not strongly supported or defined in the Department itself. The information program was administratively in State but it was not in State's policy side. State policy people thought of the information staff as journalists. They would be told what the State Department was doing or planning only after the action had taken place. Such publicity-minded people need not and should not be taken into the political planning process or the background discussions leading to decision. Information people did not have the political intelligence or experience to advise Foreign Service Officers in the Department or in the diplomatic missions.

These attitudes naturally frustrated the information people. They did not claim the right of participation in policy making. However, aware that the words and the manner by which the policy was presented often had as great a foreign impact as the substance of the policy itself, information people wanted to be consulted before the decision was finalized. Without altering the policy such discussions might lead to

SECURITY INFORMATION
TOP SECRET

Page 23 of 95 pages

TOP SECRET
SECURITY INFORMATION

December 19, 1951

a presentation of the policy in a way which would have the most favorable impact upon all foreign audiences. This difference of attitude between the information and political policy people in the Department of State long hampered effective action. Policy makers considered that they had evaluated the psychological factors and the information people merely had to grind the mill and publicize it. Information specialists, while they disseminated the policy given them, saw how an improved presentation would have obtained a more favorable reaction. It was several years before the career Foreign Service Officers modified their views. In the interim, a full and fair picture of America was the only admitted objective of State's information program.

Intra-departmental coldness towards information activity was a limitation upon the program's effectiveness. An even greater deterrent to psychological activities was the hostility of large segments of Congress toward such activities. Part of the hostility was a hangover from Congress' attitude toward OWI; part was due to the privately owned information media seeing State's program as competition, and part was due to the unpopularity of the State Department, probably arising out of the frustrations of the postwar crisis which could not openly be directed at the political and policy sections but could safely and openly be vented against the information program. Hence rancorous partisans and even Democrats with grievances could attack, belittle and cut the funds for the information program and still claim that they were not interfering with foreign policy. The information program therefore became one of Congress' perennial whipping boys. This attitude was evidenced in appropriations for the information program between 1946-1948 which were reduced by more than half. These actions required that the personnel be reduced in proportion. The publicized abuse and criticism and Congressional uncertainty about the information program increased these personnel losses, not merely in quantity but more

SECURITY INFORMATION
TOP SECRET

Page 24 of 95 pages

TOP SECRET
SECURITY INFORMATION

December 19, 1951

importantly, in quality. The better trained and the more capable people decided that their status in State was too precarious. They pulled out of the information program and moved into more certain and more effective work. In this process, State lost the most capable specialists with whom an expanded operation might have been developed. When the demands increased after 1949, the Department had to start practically from scratch.

Another example of inappropriate pressure on the information program was the Congressional insistence in 1947 that America's international news programs should be prepared and programmed by the private broadcasting companies with funds provided by the Department. Within a year private enterprise came back to Washington begging the Department and Congress to return to the old system whereby the companies rented the facilities to the Department of State and the Department had to recruit inexperienced people to fulfill its responsibility of programming the entire output. No matter how interested or aggressive State's information people might be, they were hampered by the Department's disinterest and the acknowledged hostility of the Congress and of private enterprise towards government information activities.

Indefinite and ineffective as State's information program might be in comparison with Russian propaganda, the overt psychological activity did maintain its existence. Covert psychological warfare disappeared. National policy of 1945 and 1946 viewed covert operations as un-American and undesirable. Little high level support could be developed for continuing the experience of such operations even within a small planning cadre. When powerful groups condemned the maintenance of any American secret intelligence, it is understandable that covert operations would receive even less favorable attention. Yet an ad hoc decision to maintain secret intelligence activities

SECURITY INFORMATION
TOP SECRET

Page 25 of 95 pages

TOP SECRET
SECURITY INFORMATION

December 19, 1951

provided the strand on which postwar covert operations were attached. Without detailing the inter-governmental differences about central intelligence, the residue of OSS' secret intelligence activity was finally formed into a Central Intelligence Group under a Director of Central Intelligence who would be responsible for an interdepartmental committee. This was accomplished by the Presidential directive, 26 January 1946, "Coordination of Federal Foreign Intelligence Activities".

The significant phrases about covert activities in this directive, which the President issued on the personal recommendations of his staff advisors rather than upon the recommendations of the Departments concerned, were two vaguely stated duties assigned to the Director of Central Intelligence (DCI). Covert operations were eventually to be developed from them. In addition to correlating and evaluating all intelligence and recommending over-all policies and objectives, DCI would perform such services as the three Secretaries determined could be more effectively accomplished centrally and "perform such other functions and duties relating to intelligence affecting national security as the President or the National Intelligence Authority may direct".^{10/}

It is not clear whether this directive in these phrases visualized that covert operations might become necessary and thereby provided for them. Such interpretations were current in the military intelligence agencies. Whether these phrases were so conceived on the White House level cannot be documented, but Congress in establishing the Central Intelligence Agency (CIA) in the National Security Act of 1947 used the same wording as this directive. These clauses were also explicitly

mentioned in subsequent National Security Council (NSC) papers as the basis for including covert activities within CIA. 11/

During the postwar years 1946 and 1947, psychological operations were in abeyance or of insignificant calibre. American policy continued to hope for ideal international relations and an Assistant Secretary of State returned from the first general conference of UNESCO glorifying the conference's theme: "peace on earth and good will to men". In this climate of opinion the State Department's information program could only be a specialized press service. State did not distribute its news where the American press wire services already operated. It did send complete texts of American statements which the wire services rarely transmitted. In areas not covered by American news services the State Department attempted to maintain a brief but inclusive American news service but in a reduced number of languages. As a news service, planning aspects became unimportant. The highly developed planning procedures with directives, considered and approved by military and diplomatic policy people, fell into abeyance.

At the same time the armed forces maintained their special information programs, particularly Armed Forces Radio Service (AFRS), for American soldiers in areas of occupation. Policy and operational contact between the AFRS and State's information was non-existent. State's information programs were prepared to satisfy foreign sensibilities and possible foreign interpretation. The AFRS with its GI audience tailored its news to their American needs. It was gradually recognized that foreigners listened to AFRS to learn the real American

11/ Material on the above was secured in discussions with G.F. Schwartzwalder (Bureau of the Budget), with Rear Admiral Sydney Souers, USN (Ret.) (Executive Office of the President) and Brigadier General John Magruder, USA (Ret.) (Office of the Secretary of Defense).

December 19, 1951

views. They considered that AFRS' programs were not propaganda, whereas State's Voice of America (VOA) being the official American output was tainted with propaganda.

Until 1947 it does not appear there was any serious effort to coordinate the output of these separate outlets even though differences in presentation might seem to foreigners to be contradictions or variations in American policy. Meanwhile State's program continued to be hampered by domestic minorities insisting that a false impression of the United States was being given to Europeans. Unfavorable publicity reduced the imaginative possibilities and State's operators felt themselves bound to a presentation of "a fair and balanced picture of the United States". As Russian propaganda became aggressively anti-American, the State Department hesitated to counter it with American propaganda lest Congress eliminate the entire information program.

PART II. THE BEGINNING OF THE PSYCHOLOGICAL EFFORT

While the United States Government, by choice and under private and Congressional pressure, limited its information activities to factual news about American policy, the international scene was clearly changing. Hopes for a mutually peaceful understanding with the USSR became dimmer as Communist pressures increased in the satellite areas of Eastern Europe. Russian attitudes in the United Nations and at the four Foreign Ministers' meetings were not lessening the tension. A contributing factor was the Russian intransigence on the regulation and control of atomic energy by the United Nations. Similarly, Russian pressure on Iran, her demands upon Turkey for pre-eminence on the Straits question, and more particularly the evident but unofficial Communist intervention in the Greek Civil War, forced American policy to reconsider its hopefully idealistic approach of 1945.

On the Greek problem, America had joined in the UN Security Council proposal to send an investigating committee which Russia opposed to study the border incidents. At the end of 1946, an American Economic Mission was appointed to assist Greece in rehabilitating its economy and maintaining its national independence. Similarly in early January 1947, the United States sent basically identical notes to Britain, Russia and to Poland protesting in diplomatic language against the undemocratic procedures of the existing Polish provisional government. The note claimed that such official conduct would prevent the coming Polish elections from being truly democratic and free. 12/

12/ W. Millis, Editor, The Forrestal Diaries (NY 1951) gives innumerable instances of American official concern, p. 129 ff: State Department Bulletin XVI, No. 392 (5 Jan 47), p. 20; No. 493 (19 Jan 47) P.134.

This paper need not detail the development of the two fundamental American policy decisions of 1947 which altered the whole trend of national policy and revitalized psychological operations. Undoubtedly State and the Military Departments had done much thinking as the Russian domination in Eastern Europe became clearer during 1946. In any policy change the influence of domestic considerations had to be kept in mind. Americans wanted peace and believed that continued cooperation with the Russians, together with the United Nations, would bring peace if our leaders took the correct steps. American dominance in atomic developments gave us a feeling of superiority if an undesired war developed and yet it also hampered our freedom of considering alternatives because of the horrendous implication that in war the atomic bomb might be used against American cities.

Whether its domestic and foreign psychological implications were appreciated or not is unknown, but America had taken the position that it would use the atomic bomb on any aggressor against international peace. American public opinion accepted this policy in expectation that it would compel an effective control over atomic energy. There was the unquenchable fear, however, that we would use the atomic bomb in case of aggression, and there would be an atomic retaliation against the United States. As Russian aggressive intentions became clearer, American policy planners, aware of domestic opinion and hoping for the idealized international peace under the United Nations, had to develop a position which could check Russian intentions and still avoid the catastrophe of war.

The solution was the Truman Doctrine, enunciated by the President to Congress on 12 March 1947. Greece and Turkey had been under severe Communist pressure to establish governments more friendly to Communism. In Greece, guerrilla warfare between Communist groups and

the government had continued for a year. Russian threats had forced Turkey into a rearmament program which jeopardized its economic existence. Britain had aided these countries with both political advice, economic and military assistance. By 1947 Britain's domestic economy was so precarious that England warned that if the United States could not replace British military and economic aid, the Eastern Mediterranean would fall into the Communist orbit by Allied default. This British action was publicized and the American public became excited. Opinion favored checking Communist intentions but insisted upon the avoidance of war. The answer was the Truman Doctrine, the Doctrine of Containment, developed mainly by the Department of State with the approval of the military services.

The Truman Doctrine expressed in the President's speech to a joint session of Congress declared it to be desirable American policy to provide arms, economic aid, and military advice to Greece and Turkey so that those governments could maintain their freedom against an engulfing Communism. While he explicitly requested aid for Greece and Turkey, the President declared that future American policy would continue to contain Communism within its then existing area. Wherever Communist pressure threatened to push beyond the existent Communist-controlled areas America would provide aid to the nation so threatened which wanted to maintain its freedom ^{13/}

^{13/} State Department Bulletin XVI, No. 403 (23 Mar 47) p. 534 ff; Forrestal Diaries, p. 247, ff. The policy of containment was most explicitly developed in an unsigned article, "Sources of Soviet Conduct", Foreign Affairs, XXV (July 1947) p. 566-582, which currently and thereafter was attributed to the State Department's major Russian planner, George Kennan. The gist of of the Truman Doctrine is in the words "the main element of any United States policy towards the Soviet Union must be that of a long-term, patient but firm, and vigilant containment of Russian expansive tendencies....The possibilities of American policy are (contd. next page)

During the Congressional debates on Greek and Turkish aid, and in authorizing legislation, it was evident that this American aid was considered as a limited counter to an immediate Russian threat rather than a fundamental change of policy toward Russia and our desired postwar world. It was expected that when they realized that America would oppose unlimited Communist expansion the Russian leaders would drop their aggressive demeanor and cooperate in the organization of a peaceful world. While Congress debated aid to Greece and Turkey, and the departments initiated the necessary military and economic aid programs, Western Europe's economy was rapidly deteriorating.

France and Italy were undergoing severe economic strain as a normal consequence of long German occupation and the postwar inflation. Economic dislocation and Communist-inspired labor unrest threatened France with a political crisis during which the Communist minority might gain control. Economic crises in France and Italy threatened England's stability and a depression throughout Europe. Americans were aware of these foreign economic issues and their relationship to our own economic welfare. However the main American concern was that Europe's collapse increased the possibility of Communist domination of Western Europe. In this crisis the State Department proposed large-scale American economic aid to Western Europe to improve financial and manufacturing conditions, to alleviate the threatened unemployment and labor discontent and thereby counter Communist-inspired unrest. The formal promulgation of the proposed economic aid was made by Secretary of State Marshall in his commencement

13/(contd)

by no means limited to holding the line and hoping for the best. It is entirely possible for the United States to influence by its actions the internal development, both within Russia and throughout the international communist movement". Facts and news and the resultant pressure of world public opinion were then conceived as the major instruments of influencing Russian and world opinion.

address at Harvard, 5 June 1947.

In one paragraph Marshall suggested that America would provide economic recovery funds to these European states who were willing to cooperatively plan and implement a continental economic program. Marshall's Plan for European recovery was heralded in the American and European press. The original Marshall Plan was not limited to non-Communist countries but included all European countries who would pool their economic potentials for the common good of all Europe. Russia and its Satellites attended the Paris meeting to develop the Committees for European Economic Cooperation (CEECE). Subsequently the Russians withdrew from the CEECE and their Satellites followed. It was Russian opposition which gave the Marshall Plan the character of another positive American step to counter Russian expansion, this time through economic aid. Marshall's policy declaration initiated extended negotiations in Washington and in Europe to prepare the plans so that Congress would approve and authorize the European Recovery Program (ERP). The Economic Cooperation Administration (ECA) was established by Congress in April 1948 to direct American participation in ERP. Russian policy towards America meanwhile crystallized into an officially peaceful but actually hostile attitude. Communist policy militantly opposed the Marshall Plan as American imperialistic domination of European economy. To destroy ERP the Russians in 1947 organized the Communist parties in its satellite areas, and even those in the Western countries, into the Cominform. 14/

14/ Communist Information Bureau (Sep 47) Pravda (5 Oct 47). Studies of the Russian motives for the establishment of the Cominform suggest that its purpose was to accomplish the acceptance of a single communist party line by all the independent Communist parties in Europe without irritatingly and openly identifying it with the Kremlin policy. The cominform would be a front by which Kremlin policy was given the appearance of being freely adopted by the representatives of all Communist parties acting on a free and equal basis. CIA Studies on the Cominform.

December 19, 1951

The Cominform's militant agitation against the Marshall Plan rapidly passed beyond strict information activities into actions. The Communist apparatus, particularly in France and Italy, flexed its muscles, preparatory to a full-fledged test of strength in the elections in 1948. The Communist-dominated trade unions in France and Italy increased agitation and strikes to dislocate economic life and prevent these unstable governments from joining ERP agreements. Communist opposition to the Marshall Plan worried American policy makers and great efforts were made to present the Marshall Plan as a cooperative European-American enterprise. The critical situation, while Congress debated and legislated, awakened American officials to the necessity of our overseas information program presenting a uniform viewpoint. Whether it was issued by the Voice of America, by local USIS, by the Armed Forces Radio Service, or by American private and commercial outlets, America's story had to be uniform or Communist propaganda would exploit the differences. This background explains two important developments in American psychological operations which occurred at the end of 1947.

A paper requesting that the government's foreign information measures be strengthened and coordinated was presented at the first substantive meeting of the National Security Council (NSC) in early December. State Department presented a SANACC proposal which emphasized that government information could influence foreign attitudes directly by explaining American objectives and countering anti-American propaganda. To strengthen the information program, NSC approved, and the President directed, that the Secretary of State be charged with formulating the information policies and that he implement them through his department and that he would coordinate all other government overseas information so that it was in conformity with

SECURITY INFORMATION
TOP SECRET

Page 34 of 95 pages

that developed policy. The Assistant Secretary of State for Public Affairs would be assigned these responsibilities under the Secretary. He would be assisted by an informal group of representatives from the government agencies having foreign information activities. The Assistant Secretary would determine the most effective utilization of all information facilities, and develop interdepartmental plans and programs, so that foreign opinion would be influenced in a direction favorable to United States interests. This decision, NSC-4, was the first direct action to improve postwar foreign information service.^{15/}

This early NSC paper on overt psychological operations represented a year and a half's study by an interdepartmental committee on psychological warfare. This special planning committee had been established in the State, War and Navy Coordinating Committee (SWNCC/later SANACC) after the Assistant Secretary of the Navy in June 1946 had suggested its need. SWNCC appointed an ad hoc committee representing State, War and Navy Departments. This group was directed to review World War II psychological warfare, to recommend a peacetime organization to keep it in a "ready for mobilization" status, and to prepare proposals for its wartime organization. This ad hoc group prepared a long report recommending the establishment of a permanent SWNCC subcommittee on psychological warfare to develop policies, plans and studies for its use "in time of war or threat of war as determined by the President". It suggested that this subcommittee would be chaired by State's representative and consist of a representative from Central Intelligence Group, two War Department officers (representing the Army and the Air Force) and a Navy representative. This proposed subcommittee

would study and prepare effective psychological warfare plans containing organizational patterns and basic policy assumptions and decisions as well as the personnel, the man-hour and logistic requirements for a national psychological warfare effort during wartime. These plans prepared by SWNCC would be sent to JCS and the National Intelligence Authority for concurrence. The SWNCC Subcommittee was authorized to plan, guide, coordinate, and execute the American psychological wartime effort until a national organization was established. With relatively minor changes the proposal for a permanent psychological warfare subcommittee under SWNCC was approved on 30 April 1947. Although it changed its name to SWNCC Special Studies and Evaluations Committee, which was merely a cover name, this body presented the first postwar document on psychological warfare ^{16/}

This SWNCC Subcommittee provides one line of continuity for the postwar revival of interest in psychological warfare. It was the activity of this Subcommittee that eventually came to the attention of the National Security Council and which led to the series of NSC papers on psychological warfare planning. This first SWNCC paper on psychological warfare established several definite patterns which became unalterable departmental traditions. In attempting to delimit the concern of the different departments, this paper invented the unfortunate three-fold time blocks for psychological warfare: during peacetime, in time of war, "or threat of war as determined by the President". These three time divisions were subsequently repeated

^{16/} (S) SWNCC 304/1, "Psychological Warfare", 10 December 1946; (S) SANACC 304/15, "History of the Activities of the Subcommittee on Special Studies and Evaluations", June 1948. With the establishment of the Air Force as an independent service and department in the National Military Establishment under the National Security Act of 1947, SWNCC's title changed to SANACC (State, Army, Navy, Air Coordinating Committee).

in every major paper on psychological warfare organization and raised unnecessary organizational conflicts because they involved the pre-eminence of the different Departments' responsibility for each period. The Subcommittee assumed that in peacetime, psychological warfare or more properly, the information program, was pre-eminently a State Department responsibility for planning, execution and coordination. During the threat of war or national emergency, the State Department still had primary concern for planning but had to coordinate its policy and operations with the armed services. In wartime State retained primary policy interest, but the responsibilities of the armed services increased as psychological warfare more closely supported and contributed to military policy.

In another area this original paper set an important precedent. It provided that psychological warfare in actual or projected military theatres of operations was the responsibility of the theatre commanders. Directives, guidances and communications to the theatre commanders regarding psychological warfare could only be forwarded through JCS channels. The SWNCC Subcommittee also undertook the study of an organization for psychological warfare during wartime. It proposed

an independent agency directed by a Presidential appointee with fulltime representation from State Department, the armed forces, CIA, and if desired, from the Office of Censorship and the office responsible for domestic information. In these SWNCC studies the coordination of overt and covert psychological operations was for the first time seriously considered. In 1948, SWNCC was assuming that on the level of the national organization, plans for overt and covert activities would be coordinated in accordance with over-all psychological warfare plans.

Very little of the SWNCC Subcommittee's proposals on psychological warfare proved to be effective if one uses the criterion of acceptance as national or interdepartmental policy. While many of its papers were approved by SWNCC, some approved by the JCS and several forwarded to the NSC, these SWNCC papers were always overtaken by an agency paper or an NSC paper. Nevertheless the SWNCC Subcommittee on psychological warfare performed a valuable educational service. The departmental representatives on the Subcommittee had to present psychological problems to their departments for policy decisions. SWNCC papers had to be circulated among the departments, and even to the JCS for concurrence. In this way psychological warfare and its problems were forced on the attention of political and military planners who might have preferred to ignore the entire subject as outside their area of responsibility. Those papers which were accepted by SWNCC and forwarded to NSC, brought a reconsideration on a national level of psychological warfare. One example will suffice. The SWNCC Subcommittee proposed that a national organization for psychological warfare be established in the future. The JCS reaction urged its immediate establishment. This development led to an NSC decision that an interdepartmental group be set up in State Department to do such planning. 17/

Before the SWNCC Subcommittee did more than recommend a national psychological warfare organization for Wartime, the European crisis of 1947 forced American policy makers to reconsider the idealistic American approach towards international informational work. Mention

has already been made of the open and avowed ideological attacks against the Marshall Plan by the Communists. Communist press and radio efforts were only one part of their European campaign. They realized that mere words were not enough, and the field of labor activities was chosen for additional Communist pressure. Controlling the major French labor unions, the Communists called throttling strikes in the coal and transportation fields to prevent government cooperation in the European Recovery Program (ERP). While these strikes might have wrecked French economic life and the ERP, the Kremlin would gain power and yet avoid any appearance of USSR meddling in French internal problems. The strikes were internal domestic concerns with which neither Russia nor the United States should interfere. If the strikes succeeded in eliminating France from ERP, however, American objectives would be defeated. Russian prestige and influence would proportionately increase in Western Europe.

American policy makers were enormously concerned about these Communist tactics. America could not formally and openly interfere in the French labor question. Pressure might be put on the French Government but the United States could not formally influence the labor leaders of France. American officials, however, could not allow

France was not the only area of Communist instigated crises in 1947-1948. Italy provided an equally fruitful field for Communist subversion. Communist success in Italy would increase Communist power in the vital Mediterranean area. The wartime Allies had just ratified the Treaty of Peace with Italy and a new Italian Government was to be elected in April, 1948, the first freely elected government of the new democratic Italy. Italy's economy was weakened by widespread unemployment and severe scarcities. The ravages of war and the lack of machinery had reduced its farming population to the 1910 level. Widespread Italian dissatisfaction, if exploited, might enable Italian Communists through threats, bribery, cajolery, and "pie in the sky" promises, to gain the election of sufficient Communist representation in the legislature to keep Italy out of the Marshall Plan and bring it within the Iron Curtain.

State Department planners were agreed that action had to be taken so that the Communist efforts would not swing the Italian election to the Communists. A second NSC paper was developed out of the SAMACC paper presented by the State Department in December 1947, advising the

NSC that the USSR and the Communists were using covert operations to discredit and defeat American objectives. The United States, to insure world peace and national security, would now have to supplement its overt information activities with covert operations. This significant policy paper, NSC-4-A, was officially approved by the NSC, and it directed the Director of Central Intelligence (DCI) to undertake covert activity. This paper, at the first substantive meeting of NSC, is the first authorization for American covert activities. ^{19/}

In March, 1948, State Department's Voice of America beamed an extensive information program to Italy. As the official instrument of the Government, VOA attempted to make clear the "intensity of the American interests in Italians' welfare...without providing grounds for the charge that the United States is interfering unduly". It was recommended to the VOA operators that news and commentaries should clearly present the American point of view to the Italians and to all Europeans. Free elections would show whether the Italians desired a free government or wanted to be subject to the Moscow dictatorship. America would have to determine its action after the Italians had made their choice. Without implying that America would shut off aid to a Communist Italy, the VOA should emphasize that Moscow had not permitted any of its Satellites to participate in ERP or to receive its benefits. The Italians would be reminded of "the unequivocal assurances of the effective United States support for the free nations of Western Europe". President Truman had promised aid to all democratic people, and Congress had implemented the promise in the Greek and Turkish aid program. While the VOA would stick to news reporting, it would emphasize to the Italians that all previous working agreements or political compromises with Communists had always resulted in disaster and eventual Communist domination. The Balkan countries and the recent coup in Czechoslovakia were to be

constantly repeated as warning examples of appeasement's danger. ^{20/}

These antagonistic relations between the Communists and the West, under American leadership, intensified the existent Cold War, until now an unadmitted reality. Communist seizure of control in Czechoslovakia in February 1948 and the pressures on Berlin, emphasized to American leaders that traditional American diplomacy was insufficient to check the Russians. Communist successes in propaganda, political blackmail and secret operations increased the cynical despair engulfing Western Europe and endangered the purposes of the Marshall Plan. Western Europe might easily fall prey to the Kremlin unless America could reverse the trend. The United States could not officially and openly match Russian action. Hence covert activity, which could not be attributed to the United States, did offer the means to match the Russians. The revived interest in covert operations in early 1948 developed concurrently among the planners in both State and Defense. However, completely divergent and irreconcilable views on the American position towards the USSR complicated their discussions of covert operations within American policy.

The State Department was committed to the "policy of containment", maintaining that war was neither desirable nor inevitable. State planners visualized covert operations as actions short of war, to weaken the Communist position of power and to strengthen the prestige of the Western Powers. Defense accepted the existing policy that America desired peace, but it also had to consider war with the USSR as the major assumption of the military planners. Covert operations were, therefore, seen by the military as mere preliminaries to, and

preparations for, an eventual war. State was interested in covert operations such as rumor-spreading, bribery, the organization of non-Communist fronts, and other non-war related activities. Covert operations to Defense mainly meant evacuation, evasion or escape of leaders important to an Allied war effort, the organization of guerrilla movements convertible into underground armies as the war started, and the preparation of sabotage and assassination for war-time implementation. These ideas and divergencies about covert activities in peacetime were not written into the papers and frequently were not understood by the participants in their discussions. State and Defense could agree, however, that covert operations should be started immediately. They also could agree on the organizational pattern to get such operations under way. Hence it was that the necessary NSC staff studies and decisions could be prepared and taken without mention of these important department divergencies.^{21/}

After the Italian elections had provided a clear victory for the West and a temporary setback for Communism, the State Department prepared the basic paper which proposed a permanent organization to perform covert activities. At the end of April, 1948, the State Department, acknowledging the importance of covert activity to supplement overt American policy, proposed that a Director of Special Studies, nominated by the Secretary of State, and appointed by the NSC, together with a planning staff, should be established under the NSC. This Director, under the NSC, would develop plans for covert operations, provide for their execution by existing government agencies, and review

^{21/} Telephone conversation with George Kennan (formerly Chief of State's Policy Planning Staff) 23 November 1951. Mr. James Lay, Exec. Secy. of NSC, disagrees with the view that the NSC Senior Staff did not understand the different viewpoints.

the entire program as it was in process of execution. He would also develop a personnel training program and a catalog of the special supplies and logistic support required for such covert activities.^{22/} The NSC paper was circulated to the interested Departments and to the JCS. In JCS there were differing points of view which delayed JCS action. One group in JCS felt that the proposed organization was satisfactory so long as the NSC action did not prejudice a review of covert operations during a national emergency. The other view within the JCS emphasized that certain features of the NSC proposal infringed on JCS prerogatives related to training programs and plans for wartime covert activity. This view also emphasized that covert operations should not be limited to CIA since the military services could perform many such activities.

While the JCS was making up its mind, the Director of CIA forwarded a proposal to the NSC which attempted to reconcile the State and JCS views. He emphasized the difference in the responsible control of covert operations in time of peace and in time of war. DCI proposed that the paper be amended so that covert operations during peace would be placed under CIA with high level policy guidance from the State Department. In wartime, covert planning would be developed by a combined committee of JCS and CIA and covert operations would be transferred to JCS' control. Meanwhile the JCS resolved its differences; covert planning and operations in wartime should be under the JCS since the planning and personnel training for wartime activities was a military responsibility. Receiving the JCS comments and DCI's suggestions, the NSC staff in June developed a revised draft which was approved with a few amendments by the NSC and adopted as

^{22/} (TS) NSC 10, "Director of Special Studies", 12 May 1948.

SECURITY INFORMATION
TOP SECRET

the directive and charter for American covert operations. Since CIA was responsible under the NSC for espionage, the staff paper proposed that covert activities in peacetime should also be placed within CIA. A separate Office of Special Projects would be established under the Director of CIA, headed by an individual nominated by the Secretary of State, approved by DCI and appointed by the NSC itself. The staff draft provided for an operational advisory committee consisting of representatives of the Secretaries of State and of Defense.

These liaison representatives would supply full policy guidance on covert projects and would assist in preparing all plans. Any disagreement between the DCI and the departmental liaison officers should be referred to NSC. This organization would study and develop plans for NSC consideration regarding the necessary collaboration with the JCS for covert operations in wartime. ^{23/}

The staff paper on the Office of Special Projects was accepted by the NSC at its 13th meeting (17 June 1948). However, two major amendments were made by the NSC. The policy advisory committee representing the Secretaries of State and Defense would have been practically an independent policy-making body controlling the activities of the Office of Special Projects. The NSC eliminated this paragraph and made it a duty of the Director of CIA to insure that covert operations were planned and conducted in a manner consistent with American foreign and military policy. In this process DCI was to use the above-mentioned representatives of the Secretaries of State and Defense. The NSC change had the effect of making the State and Defense liaison with the Office of Special Projects subordinate to the position of the Director of CIA. The other major change

resulted in the adoption of the JCS' position on covert operations in wartime. The NSC staff proposal had provided that the Office of Special Projects would conduct wartime covert planning and operations in collaboration with the JCS. The NSC amended this paragraph, the famous paragraph 4, so that plans for wartime covert operations had to be coordinated with the JCS. Wartime covert operations would be conducted under the control of American theatre commanders who would receive their directives on covert operations through the JCS "unless otherwise directed by the President". Here the NSC again changed the emphasis by providing that all plans for covert operations in times of war had to be coordinated by the JCS. This paper, NSC 10/2, has been the charter for American covert operations which fundamentally altered postwar thinking regarding psychological operations. NSC-4-A was cancelled when NSC approved 10/2. NSC-4-A had never become sufficiently well-known or influential. Hence, the tradition that American policy first accepted covert operations as a major instrument in June 1948 is basically correct, although not completely accurate. 24/

The NSC decided that American policy would be implemented by covert operations. The actual development of covert operations, however, was a time-consuming activity. A director of the Office of Special Projects had to be satisfactory to State, CIA and Defense, if an NSC appointment was to be assured. It would seem that Secretary of Defense Forrestal and Mr. Lovett, Under Secretary of State, considered the Office of Special Projects as their personal concern. They obtained a director on the understanding that he would be given sufficient time to study the complications of covert operations, to secure and train the technically skilled personnel required, and to organize methods of operation,

or to use the technical jargon, develop his apparatus. There were several significant features in the development of the Office of Special Projects which influenced its early operations. 1948 was a critical year and the Director of the Office of Special Projects had no time for contemplative study. He had hardly secured his major assistants and the departmental policy advisers when he was asked to undertake urgent operational duties.

The Office of Special Projects (which became the Office of Policy Coordination, will hereinafter be identified as OPC) started in a difficult administrative position. OPC was in CIA administratively and with a strict reading of NSC 10/2, the Director of CIA would have control over its policy and operations. When it commenced to operate, however, because of the personalities involved, because OPC received instructions and guidance directly from the Secretaries of State and Defense, and because of the special sensitivity of its operations, there was a general agreement among the officials involved that OPC should be a separate and independent entity within CIA. Independence even went so far that OPC's intelligence requests were handled by CIA as requests of a separate agency. OPC, on its part, was reluctant to tell the intelligence side of CIA about its operations even though the DCI had been given the responsibility of policy coordination and of appealing to NSC if policy disagreements arose. The practice developed, however, that the departmental policy representatives only consulted with OPC, and the DCI was initially left out of covert planning. This procedure initially gave OPC a relatively greater freedom of action, but removed the single responsible authority who could decide if a particular covert operation was in accord with American policy. When Lieut. Gen. W. B. Smith became DCI, he brought OPC directly under his authority.

December 19, 1951

As the international situation increased the opportunities for covert operations, and after its original godparents, Forrestal and Lovett, left the government, OPC found itself in the questionable position of judging whether its own operations even when desired or approved by the departmental liaison officers actually were in accord with any planned national strategy. American objectives with respect to the USSR had been formulated by the NSC in NSC 20/4 (November 1948) but these objectives were general and vague objectives. Such national aims afforded covert activities many opportunities, but their vagueness left many uncertainties on which the operational planner wanted official answers. OPC's position became more unsatisfactory when the departmental policy representatives presented projects on a piecemeal basis and OPC had no time for long-range planning and preparation of its needs. OPC continued to develop and to operate, but it was restrained by personnel training and technical uncertainties until the Korean war revitalized other agencies' interests in covert activities.^{25/}

While the NSC was establishing covert operations as an integral instrument of the national policy, State Department was acting to develop greater coordination of the current foreign information program under NSC-4. A fulltime interdepartmental staff had been provided the Assistant Secretary of State for Public Affairs by NSC-4 to develop the adequate coordination of the government's foreign information program. It was three months after NSC-4's approval that State Department appointed its chairman of the Interdepartmental Coordination Staff (ICS). The Air Force and CIA sent their members in April; the Army arrived in early May, but the ICS did not become complete until June 1st when the Navy representative reported.^{26/}

In addition to a half year's lateness, the ICS was temporarily hampered by the uncertainty of its responsibilities. Like the SWNCC Subcommittee on Psychological Warfare, ICS commenced as an exploratory and investigative group. An interdepartmental directive was developed by the Staff, subsequently approved by the Assistant Secretary of State for Public Affairs and issued to the three service Secretaries in the National Military Establishment and to the Director of CIA. The directive was not of shattering significance. It officially reminded all military and political departments that the President had authorized the Secretary of State to insure the coordination of the many foreign information outlets so that a unified and consistent American program would be presented for foreign consumption. This directive went through the department channels to the theatre commanders and diplomatic missions overseas so that all American representatives were officially made aware that informational activities were a part of national policy. Whether it was State's information outlet, or the military's AFPS or their Information and Educational Program, the same over-all picture should be presented.

The ICS provided a continuous mechanism to keep State aware of the military's information policy and to notify the military of major changes in State's presentation. When the State Department desired special assistance from the armed forces information outlets, ICS could arrange the timing. ICS had no control over policy matters. Its potential position as a policy coordinator was weakened by the fact that the information program of State did not have any adequate planning staff, and it was not consulted by the political policy planners prior to the policy decisions. The Assistant Secretary of State for Public Affairs was presented with a fiat accompli

SECURITY INFORMATION
TOP SECRET

Page 50 of 95 pages

and expected to make the best possible presentation. This was doing the information work in a vacuum. Nevertheless the ICS did improve American operations in the foreign information field, particularly in developing necessary rapid liaison between State and the three military services. The ICS prepared and supervised the execution of interdepartmental plans to insure that the American story of the Berlin blockade and Airlift was adequately presented by all government-controlled media. Similarly, the Yugoslav crisis and the Finnish elections were items on which the ICS successfully manipulated interdepartmental interests so that American government outlets presented a coordinated, even if not identical, series of reports and bulletins.^{27/}

During 1948, important developments on the national level increased the emphasis on psychological operations. The European Recovery Program (ERP) was legislatively authorized by Congress and an independent agency, the Economic Cooperation Administration (ECA), was established to carry out American economic policy under State Department guidance. Congress explicitly authorized ECA to maintain a European information program to insure that Europeans would be aware of America's interest in, and contribution to, their recovery. This Congressional decision on information work was a direct result of the numerous Congressional junkets to Europe in late 1947. The Congressmen had been intentionally made aware of the extent of European ignorance regarding America, its purpose and objectives. The important role played by Communist propaganda in perpetuating these misconceptions was made clear. The limitations on the American

information program in combatting these errors became evident to the Congressmen. Hence in 1948, Congress gave verbal and legislative support to the psychological effort. Most importantly Congress increased the appropriations for information work and promised more in succeeding years. It enacted the Smith-Mundt Act which for the first time gave a statutory basis for State's information program. ^{28/} This Act gave the State Department a legal basis for its previously traditional claim that information policy determination was the prerogative of the Secretary of State. Other agencies had never denied this position for peacetime activities but had attempted by interpretation to restrict State's prerogatives in time of emergency or during war. Now Congress had validated State's position and subsequent interdepartmental discussions on information and psychological warfare programs were prejudiced by State's interpretation of the Smith-Mundt Act.

The specific informational objectives mentioned in the ECA Act was another recognition by Congress that the influencing of foreign opinion and attitudes was important to American policy.

The formulation of an informational policy in ECA's overseas activities is most difficult to trace because of that agency's double decentralization. ECA's Washington office was mainly a central point to service its independent counterpart, the Office of Special Representative (OSR) in Paris. The ECA offices in the ERP countries were basically autonomous, with only vague relationships to OSR and ECA-Washington for centralized bookkeeping. At each local ECA office there was an information officer, responsible to the local ECA Chief of Mission under general guidances from the Information Section of OSR in Paris. Each local

information officer was expected to exploit the locally available media. American information or locally produced pro-American news was to be spread locally to insure that proper recognition was given to local recovery projects as a part of America's over-all effort to help Europe and to keep it free. Certain individuals in ECA's CSR in Paris had discussed covert information to supplement ECA's overt presentation of the American position, but in its first year ECA's information program was based on the old journalistic principle that only straight news was needed to keep the Europeans informed. ECA emphasized news releases, fostered local publicity for ECA-sponsored projects, and whipped up local interest for the American objectives on ERP.

ECA and the State Department developed unwritten understandings whereby ECA's material was incorporated into State's VOA programs and overseas news files. In each ERP country, the local ECA information man and the USIS Chief at the Embassy informally discussed and agreed on their respective fields and how each would supplement the other's activities. The relations between ECA and State Information people were in the main, satisfactory and cooperative. Since ECA paid higher salaries, it often secured uninhibited and energetic operators who might "free wheel" informationally and irritate State's local representatives. The USIS Chiefs were limited in their information work to materials approvable by the Ambassador. ECA operators, relatively independent of the Ambassador, unaware of the need or the desirability of clearing with Foreign Service Officers, and, desiring rapid and tangible results, carried out information programs at times which were unapproved and thereby caused bad feelings.

ECA and its information campaign was, however, only one aspect of the Cold War. The Berlin Airlift to supply West Berlin and so checkmate the Russian blockade was a psychological effort as well as

an economic and political one. During this period, NSC re-studied the international positions and objectives of Russia and the United States. The Russians were using all possible methods and tricks to weaken American prestige in Europe. American security was thereby threatened. The danger of the power struggle turning into a fighting war was recognized. To counter this Russian threat, NSC had to develop American objectives toward the USSR, which would over the years lessen the danger of war while reducing Russian power so that it could not threaten world and American security. NSC determined that this national policy would be pursued by all means short of war. The Satellites would be encouraged to emerge as independent countries. The attitudes of the Russian peoples and the spirit of nationalism within the USSR would be main targets for American action and influence. America should inform the world of the true nature of the USSR and convince it that the USSR threatened world peace. To accomplish these aims, America would develop a position of military readiness, increase its economic reserves, and help all non-Soviet peoples to improve their conditions, while it kept the world and the American people thoroughly informed of the developing situations. ^{29/} These American objectives mark a fundamental change in American policy. Unlike policy decisions of 1947, NSC 20/4 recognized the long-term Russian threat which had to be countered by long-term American policies. Peace and international good will were no longer "just around the corner". NSC 20/4 was equally important because of the emphasis and importance which it put on psychological operations as a means

^{29/} (TS) NSC 20/4, "Report to the President. United States objectives with Respect to the USSR to Counter Soviet Threats to United States Security"; 23 November 1948. The President approved these objectives 24 November 1948.

of implementing national policy in peacetime. Political, military and economic actions to foster national policy were well recognized. NSC 20/4 recognized the contribution of all these and then emphasized the information and the opinion-influencing activities additionally required to accomplish America's objectives. This paper did not use the words: overt, covert, or psychological operations. It is evident, however, that such activity was visualized even if vaguely. State and OPC were not empire building when they recognized this policy as calling for great increases in their respective overt and covert activities. It took time, however, to transform NSC's lofty and generalized statements into operational plans, coordinated with the military, economic and political planning under NSC 20/4.

An early evidence of this firmer policy towards the USSR was the American initiation of the North Atlantic Treaty whereby the United States and Western Europe agreed to cooperatively plan and develop mutual defenses against aggression. America's formal participation in a Grand Alliance required that American and European attitudes and reactions be carefully nurtured to support this new policy trend. Psychological considerations were significantly important in the development, the announcement, and the ratification of the North Atlantic Treaty. However, it was the increasingly tense international situation which focused greater attention on the need for a psychological warfare organization to plan its wartime usage.

As early as January 1948 the old SMNCC but now SANACC Subcommittee on psychological warfare had proposed a small organization for wartime planning be set up under the NSC. The Subcommittee suggested that the actual agency, while it should be approved in principle, need not be organized immediately. The JCS recommended that the proposed organization be established immediately as a planning nucleus without any

SECURITY INFORMATION
TOP SECRET

Page 55 of 95 pages

TOP SECRET
SECURITY INFORMATION

December 19, 1951

operational responsibilities. The whole discussion was temporarily delayed while the NSC was making its decision on covert operations. In this period State and Defense began their long disagreement on whether the proposed nucleus for wartime psychological planning should be under the NSC, or under State Department control with military coordination. These discussions were fruitlessly protracted for months until in early 1949, an NSC staff paper was developed with the cooperation of all the interested Departments.

The NSC staff proposed that there be immediately established a small organization in the State Department

to plan and make preparations for the coordinated conduct of foreign and domestic information programs and overt psychological operations abroad in the event of war or threat of war as determined by the President.

The Director of the organization would be appointed by the Secretary of State. The director would be assisted by a group of "policy consultants" representing the Secretaries of State, Defense, JCS and the National Security Resources Board (NSRB). A full time staff of representatives from the Department of State and the National Military Establishment would do the preliminary drafting. The paper directed that plans for information activities and "overt psychological operations" in the initial stages of war should be given highest priority. The paper explicitly directed that the SANACC Subcommittee on psychological warfare be discontinued. This recommendation was approved by the National Security Council and the President with the recommendations that the desired preliminary plan be produced within

90 days 20/

This new organization did not come up with a proposal in the suggested 90 days. It took time to organize the consultants into the Interdepartmental Foreign Information Organization (IFIO) and the departmental representatives into the staff (IFIS). Even a longer time was required to reconcile the divergent views of the departments and develop a modus operandi which permitted discussion. In early August, however, the Secretary of State sent a report to the NSC which had been prepared, but not approved, by IFIS on the "General Principles Covering Overt Psychological Warfare in the Initial Stages of War". Primarily a State Department paper, this proposal assumed that the President during an emergency would quickly take control of psychological warfare and that policy determination would be the responsibility of the Secretary of State who would insure the coordination of overt psychological planning with the National Military Establishment. This report proposed that overt and covert psychological warfare, censorship and domestic information should all be coordinated at the national policy level. Finally State requested that the planning of domestic information should not be combined with wartime psychological planning. Defense, in the name of the Secretary, but actually representing the views of JCS, disagreed with certain basic premises of the State Department. They suggested terminological changes and a specific requirement for the coordination of psychological plans with joint war plans. The necessity of JCS approval for such plans was explicitly

30/ (S) SUNCC 304/6, "Report on Psychological Warfare," 9 Jan 48;
(S) JCS 1735/4, "Report on Psychological Warfare," 5 Apr 48;
(S) SANACC 304/12, "Psychological Warfare Organization," 7 Apr 48;
(TS) NSC 43, "Planning for Wartime Conduct Overt Psychological Warfare," 9 Mar 49. This seems to be the first mention of "psychological operations" in an NSC paper but there is no evidence that it had any special significance.

mentioned in the Defense Department's revision. Defense also suggested that the Coordinating Staff under NSC-4 and the Planning Staff under NSC-43 should be combined into one group which should both plan and coordinate. ^{31/} Defense's recommendations were accepted by the NSC and the planning organization under the Secretary of State was directed to continue its planning activities for a psychological organization in time of peace.

While the reconstituted IPIS under the aegis and influence of State Department was fulfilling its responsibilities for the improved coordination of the foreign information program and the development of psychological plans, the military planners in the Joint Staff became bothered by the relationship of the JCS with the whole problem of psychological warfare. Before mid-1948 there was no single individual in the JCS responsible for the psychological aspect of national or military policy. Several individuals in the Joint Strategic Plans Group (JSPG), because of their wartime familiarity with psychological warfare, had called attention to the psychological factors in developing war plans. When the SWICC and SAMACC papers on psychological warfare came to the JCS for their view, differing ad hoc groups in JSPG were organized. This procedure, like JCS's wartime practice, provided no continuity of JCS attitude, and expert knowledge within JCS on psychological warfare could only be ephemeral and temporary. With the NSC-10 series, and the increased SAMACC papers, the Joint Staff found its machinery ineffective.

In April 1948, as NSC-10 was considered, JSPG proposed that a psychological warfare subcommittee be established

to protect JCS interests in the multifarious aspects of psychological warfare, to coordinate the planning by

^{31/} (S) Memo, Sec./Def. to Exec. Sec., NSC, "General Principles... NSC-43/1," 7 September 1949.

the three military services for the use of psychological warfare in wartime and to develop psychological warfare plans in consonance with progressive strategic plans.

It was also emphasized that JCS's interests in psychological warfare had not been protected under the NSC-4 and 4-A series. The Secretary of Defense should request the NSC to amend its existing procedures so that the military planning responsibilities of JCS would be protected. Judging from results, the Joint Staff's sympathetic interests in psychological warfare was not extensive. In mid-July, when NSC-10/2 required it, the original proposal was partially accepted. A "Special Section" in JSPG was established to serve the policy and logistic demands which would arise under Defense's policy liaison with OPC in CIA. JSPG's Special Section would also do the staff work on all psychological papers requiring JSPG recommendation but it actually was not a responsible subcommittee of JSPG.^{32/}

The Special Section did not consider its position and capability within the Joint Staff sufficient to fulfill the psychological demands or responsibilities of the Department of Defense. It developed the proposal that a special psychological warfare section be established under the JCS, independent of the JSPG, to fulfill the JCS's responsibility not only for psychological policy formulation but more importantly for the coordination of inter-service readiness for psychological operations. Personnel selection and training, tables of organization, and research and development for psychological warfare could only be coordinated among the services on the JCS level. There was also a need for a central clearing house to insure that the services were properly and adequately providing for the necessary logistic support of psychological

warfare in wartime. On the departmental working levels there was general acceptance of this proposed Armed Forces Psychological Warfare Organization under the JCS to plan, coordinate and implement the three services' psychological responsibilities. However, when the proposal was officially presented to the JSPG, each service filed numerous exceptions so that the original paper was never adopted. Only after a year of wrangling was an equivalent substitute recommended by the Joint Strategic Planners and approved by the JCS.

Back of these inter-service disagreements was the fact that only the Air Force by 1949 had developed a special staff section for psychological warfare which could develop considered service views regarding future organization, possible plans and policies, and detailed logistic requirements. Official circulars in the War and Navy Departments in January and June 1947 had declared each service's responsibility, and had assigned this responsibility to Plans and Operations in the Army, and to Deputy CMO for Readiness in the Navy. Neither service had taken additional steps to fulfill their wartime responsibilities. Neither service had completely ignored the subject since both the Army and Navy included brief treatment of psychological warfare in the curriculum of their intelligence schools and in training manuals. Within the Army Ground Forces a small psychological warfare unit had been established to develop doctrine, plans and logistic requirements for this activity within the Ground Forces. Each service apparently felt that psychological warfare, as a peacetime concern, was not sufficiently important to require continuous and detailed staff consideration. Each service maintained representatives on the SWNCC and SANACC Subcommittee on psychological warfare and subsequently on the Inter-departmental Coordinating Staff under NSC-4. While the background of

SECURITY INFORMATION

the new American objectives were under discussion during the latter part of 1948, the services had implicit warning that they would have to provide additional personnel to participate with State in informational and psychological planning. The services had not thought out or planned their respective psychological requirements. Hence they all agreed on postponing any inter-service agreement which might in the uncertainty give one service pre-eminence in this field or inadvertently freeze another out entirely. It was better not to act at all, as JCS did, on the proposal for an Armed Forces Psychological Warfare Organization. Hence in the military establishment, as in State and in CIA, the uncertainties about psychological warfare loomed large.

Uncertainties were the order of the day, but the increased stridency of Russian propaganda against the United States and the Marshall Plan, in particular, and increasing Communist subversion in Asia forced a total American reappraisal in NSC-20/4 of Russian threats to American security and American aims to end these threats. In the main, the psychological element was not directly emphasized in this reappraisal which took place on the higher levels of the departments and in NSC. In July 1948, however, the Secretary of Defense mentioned the need of coordinating internal and foreign policies of the government. He recommended that in the Executive Branch domestic issues and foreign policy should be closely coordinated with the international situation. He noted the possible foreign impact of the stories issued by government agencies and built up by the press, as for example, the great publicity given to the indictments and arrests of the Communist leaders as General Clay returned to discuss the Berlin situation, and as the nation announced its initial draft quotas. He emphasized that while Americans might not see any interrelation,

SECURITY INFORMATION
TOP SECRET

Page 61 of 95 pages

TOP SECRET
SECURITY INFORMATION

December 19, 1951

Communists would build these three items into convincing propaganda that America was preparing for war. The Secretary recommended

that we develop as rapidly as possible some means whereby domestic events of this kind are, whenever possible, weighed in light of the international situation at a given time. It is also important that in examining this problem weight be given to the need for synchronizing these actions with our foreign information program so that our policies will be purposefully supported in all possible ways.

He recommended that the NSC investigate this problem to prevent our domestic and foreign policies from working at cross-purposes. Although it was election year and the proposal had implications which the press might have characterized as censorship, NSC approved the principle. NSC recommended that the President advise his Cabinet that important domestic matters should be closely coordinated with international affairs. The President should also request that members of the Cabinet, when in any doubt of foreign repercussions to specific domestic events, should consult with the Secretary of State prior to taking any action. ^{23/}

The major policy change of 1948, however, resulted from the approval of NSC 20/4 (3 November 1948) which explicitly recognized Soviet threats to American security and proposed American objectives to counter those threats. The major policy change eventually accelerated America's interest in psychological warfare, but it was more immediately evidenced in the more traditional fields of political, military and economic activity. Undoubtedly people in information work in State Department and in OPC of CIA were germinating ideas, projects and programs. For example, OPC had been requested to plan

During 1949 it would seem that America's major instruments of publicizing official opinion, namely the VOA and the USIS, continued programs presenting a full and fair picture of American aid to the world. Guidance regarding the Berlin Blockade and Airlift, and the break between Tito's Yugoslavia and the Cominform, undoubtedly required special treatment emphasizing the aspects favorable to the West and distasteful to the USSR. On the whole, however, VOA's program seems to have been posited on a peacetime basis until 1949. Then VOA underwent a slow change. A Russian specialist became its director. Programs in Russian were increased to a "round-the-clock" basis. The tone of the broadcasts was becoming more aggressive. While not answering the Russians, Russian lines were countered and efforts made to put the USSR on the defensive.

Simultaneously there was a reorientation of ECA's information program under OSR, Paris. The utility of covert activities to supplement the ECA's overt information programs had long been recognized but had not been developed until mid-1949. ECA's information program had been executed as a straight reporting job. It was premised on the supposition that if ECA handouts were sufficiently newsworthy and rapidly made available, the European media would give them

SECURITY INFORMATION
TOP SECRET

Page 63 of 95 pages

SECURITY INFORMATION

December 19, 1951

extensive play, and thereby develop European interest in ERP, in a European economic unification as well as the American contribution to these goals. ECA's information program prepared publications for special audiences such as labor, educational, religious and professional groups. While ECA ground out news and swamped European media with Marshall Plan information, the Cominform apparatus enjoyed greater success besmirching America's purposes. Gratitude is never a characteristic national virtue, and the European is not naive enough to believe that America would spend billions without ulterior motives. Hence the Communist publications, and particularly rumor influences on labor and progressive groups, succeeded in raising European doubts and suspicions about the ERP.

Since the Communists so effectively used covert information and other activities, it was only natural that the ECA people would seek to counter these Russian purposes by similar covert activities. It would seem that ECA initially employed covert measures not in the informational field but in the labor field. So long as labor unions in France and Italy were dominated by the Communists, economic security could not be permanent. If ECA could foster independent labor unions and attract the majority of French and Italian labor into non-Communist controlled unions, ERP might be successful. ECA had the counterpart funds to support independent labor unions, but ECA could not openly perform such action, however, since signs of any American connection would immediately injure nationalistic sensitivities and destroy the movement before it really started. ECA had to act cautiously so that a labor movement could not be attributed to the American Government. ECA had no such machinery, but the Office of Policy Coordination (OPC)

[redacted] of the State Department-OPC "treaty" of early 1950. OPC had requested State's Information people to define their respective responsibilities for covert propaganda operations. Covert activity was such that duplication could jeopardize all participants. A clearer delineation of areas in which OPC would operate and wherein State might operate was necessary. The State-OPC agreement required careful and time-consuming discussions. When approved, it provided that State would be responsible for all acknowledged American government activities in overseas areas. CIA alone would handle admittedly covert operations. For that middle area which has been traditionally classified as "grey" activities which were not officially acknowledged nor were they specifically covert, three criteria were established to determine State's or OPC's responsibility. If a negative answer could be given to all three criteria, then State and its Public Affairs people might engage in such undertakings. If the normal answer to any of three criteria was in the affirmative then State should abstain and assign its execution to CIA. The determining criteria in the "grey" field were:

1. If the particular operation or activity were actually disclosed as American initiated or supported, would it seriously embarrass the Government of the United States?
2. If the operation or activity were disclosed as American, would it seriously impair the value of the operation itself and make it ineffective in the future?

3. If the activity or operation were disclosed as American, would it seriously impair a valuable operational mechanism? State and CIA would consult on all projects in the middle area. This same agreement was developed between ECA and OPC to handle covert activities bearing on ERP, with the additional provision that in case of doubt, CIA's decision would be determining. ^{35/}

While ECA was energetically attempting to foster greater understanding and appreciation of America's interest in Europe's economy, the State Department's Informational Exchange program apparently continued on its peacetime basis. ECA information people sought State Department assistance in supplementing their programs on both the Washington and foreign mission levels. In Washington, the VOA maintained a newshound in the ECA newsroom. A daily summary of the

major ECA materials was prepared by ECA for VOA programs. In addition, ECA prepared its own daily program which the VOA translated into its various languages as an over-all summary on ERP. At the diplomatic missions, mutually agreeable relations gradually developed between the ECA Information officer and the local USIS. Administrative difficulties in defining ECA's field of information when USIS was also responsible for all American information might cause minor irritation but the knowledge of Washington cooperation, together with the big information jobs which both USIS and ECA had to accomplish, caused each to accept local working agreements so that only an occasional unsolvable project had to be referred to high levels for settlement. A major difference between ECA and the USIS in 1949 was the emphasis and tempo of their informational activities. ECA viewed its information work as part of the aggressive attack against Communist influence in Western Europe. The USIS was still dominated by the slogan: "the full and fair picture of America". ECA wanted to inform so that the recipients would react in support of the American position and against Communist aims. USIS was still working on the principle that it was a straight news service which informed without expectancy of, or direct relationship to, favorable attitudes by the recipient.

This philosophy of the USIS merely represented basic concepts of the information program in the Department of State, which disliked to classify its activities as propaganda. They were doing information work. When Russian programs were increased in 1949 and the Russians reacted with a complete jamming of American Russian programs, the VOA was more concerned with the technicalities of getting the "Voice" heard in Russia, than it was in the content of the programs. This attitude resulted partially from the fact that the entire information program was still on the defensive within the Department. State's policy

SECURITY INFORMATION
TOP SECRET

Page 68 of 95 pages

SECURITY INFORMATION

December 19, 1951

makers kept the information people informed on policy, only when the planners considered it useful to their own purpose. The information people restrained themselves to prove that they were not trouble makers. Congress' suspicious attitude towards the entire information program also made the information people conservative and strictly legalistic about what they should be doing. ^{27/}

A similar attitude characterized State's leadership of the Inter-departmental Foreign Information Staff (IFIS) set up under the NSC-43 series. NSC-43/1 had directed that basic studies be prepared under the Secretary of State for a psychological warfare plan during a national emergency and the initial stages of war. After some nine months of study and interagency difficulties, IFIS had not progressed further than a proposal for an organizational pattern which should do the planning and initial implementation of psychological warfare in an emergency or the initial stages of war. A major reason for the failure of NSC-4 and NSC-43 to produce interdepartmental agreement on psychological activities was the fundamental difference of concept between State's planners and the military planners in Defense. They agreed that foreign information programs and psychological warfare programs in periods of national emergency were instruments of national policy and had to be directed towards the achievement of national aims. There was a vague agreement that there had to be continuity between peacetime and wartime plans and programs. Then divergencies commenced. State viewed psychological warfare as an aspect of over-all policy planning. The Department of State, traditionally and under legislative authority, was responsible for foreign policy planning. Therefore, State maintained that, whether in peace or war, policy planning was the responsibility of

^{27/} From 1947 until 1949, the Secretary of State had explicitly said that his Department was not to do propaganda work.

SECURITY INFORMATION
TOP SECRET

Page 69 of 95 pages

the Secretary of State. The military planners did not disagree fundamentally with State's responsibility. They maintained, however, that during a national emergency, and especially during wartime, policy planning must be closely coordinated with, and made partially responsible to, military planning.

There was yet another significant difference between State and Defense. Defense planners, trained in the system of staff planning, developed long range, or strategic plans, to fit the most probable future contingencies. This was one aspect of the military which was at complete variance with attitudes of the civilian planners in State. State Department for generations had operated on the basis that political contingencies were so variable and intangible that long-range political plans were impracticable, if not impossible. State planners had to wait and observe how situations developed and then improvise a policy and plan to fit that particular situation. This difference was a major factor in the frustrations of IFIS. The military wanted IFIS to develop long-range psychological warfare plans. Without a long-range political plan, State could not let IFIS develop a long-range psychological warfare plan. The military could not determine their respective responsibilities or requirements without such a plan. Hence round and round the argument went without resolution or reference to the basic differences involved. The failure of the two major participants in national policy planning to reconcile their differences resulted in the failure of the NSC-43 effort and of subsequent efforts.

IFIS, under NSC-43 and 43/1, attempted to develop a national policy statement on psychological warfare which would set forth the national position during an emergency or the initial stages of war. During 1949, many staff papers were written, and departmental comments and criticisms elicited, in the preparation of a basic policy which

SECURITY INFORMATION
TOP SECRET

Page 70 of 95 pages

TOP SECRET
SECURITY INFORMATION

December 19, 1951

might be acceptable to the State and Defense Departments. The State members of IFIS were apparently hampered because the policy people, as distinct from the Public Affairs people, were still suspicious that IFIS was really trespassing on State's policy prerogative. The military on IFIS, although outnumbering State's representatives, felt themselves frustrated by that Department's limiting of IFIS to operational coordinating activities and organizational proposals, which the Department felt was the primary responsibility of the Secretary of State. With that view, military suggestions for plans and for necessary policy statements from the political side of State were tabled by the chairman of IFIS. State people were unhappy because their inquiries about the detailed implementation of information programs by the Armed Services information units ran into a stone wall of military compartmentalization. The result was that while IFIS had extended discussions and worked up many drafts of informational and psychological plans, its only real contribution was the development of another proposed psychological warfare organization for NSC consideration. ^{38/}

IFIS's inadequate results came before the NSC in December 1949 as NSC-59. This paper reaffirmed the principle that in peacetime, during a national emergency and in the initial stages of war the Secretary of State would determine policy matters and handle operational coordination. In an emergency, IFIS, which the proposal urged be kept in existence, and State's Public Affairs would provide the nucleus for an ad hoc psychological warfare organization. The IFIS group should continue to develop a plan for an interim psychological warfare organization in time of national emergency and the initial

^{38/} Conferences with Col. Paul Davis, Col. William Kinnard and Mr. Walter Schwinn.

SECURITY INFORMATION

stages of a war, together with an outline for a wartime psychological warfare organization. NSC-59, as presented to the National Security Council, was primarily the point of view of the State Department, and it did not provide for sufficient coordination with the Department of Defense, and particularly with the Joint Chiefs of Staff. Hence, the Defense Department proposed that NSC-59 be amended to assure that psychological warfare would be considered as an integral part of the national policy. Defense stated that psychological warfare plans had to be in consonance with military plans and required the guidance of the Joint Chiefs of Staff. ^{39/}

This proposed alteration was accepted by NSC and approved by the President as NSC-59/1 and became the basis for continued frustrating interdepartmental meetings between Defense, State and CIA. The major advance of 59/1 over NSC-43/1 was the acceptance of the position that until further decision was made in the event of the actual outbreak of warfare, psychological warfare was primarily the responsibility of the State Department. More significantly NSC-43 had provided for planning limited to overt psychological warfare, whereas NSC-59/1 conceived of, and attempted to provide for, the inter-relationship and liaison of overt and covert activities in one organization. This decision also rescinded NSC-4 and 43 although it retained IFIS.

While NSC-59 was in the process of consideration, several developments in the departments must be taken into account. On the military side, greater attention was being given to psychological warfare matters since increasing tensions between the USSR and America made complete war planning more desirable and necessary. On the Joint Chiefs level, closer attention by the Joint Strategic Plans Group (JSPG) was given

^{39/} (S) NSC-59, "Foreign Information Program...", 25 December 1949;
(S) NSC-59/1, "Foreign Information Program...", 9 March 1950.

SECURITY INFORMATION

to overt and covert psychological annexes to various war plans. More importantly, the serious inadequacies of psychological warfare in the theatres of operation during an emergency compelled JSPG, and even the JCS, to take a position on the long envisaged Armed Forces Psychological Warfare Organization which had been "kicking around" the departments for more than a year. The eventual solution was a compromise establishing the Joint Subsidiary Plans Division (JSPD) which was formally approved by JCS in December 1949. JSPD was established under the Joint Chiefs of Staff, but was still responsible in part to the Director of the Joint Staff. It was considered, however, to be independent of the Joint Strategic Plans Group and its subcommittee on psychological warfare. JSPD was explicitly authorized to handle intradepartmental coordination of psychological warfare for the JCS, to insure that there was departmental agreement on psychological warfare policy and operations, and that all plans had been coordinated with JSPG. The head of JSPD would represent the JCS for the policy liaison with OPC and with IFIS even though these were extra-official developments. In its liaison capacities, JSPD was authorized to represent the views of the JCS and, with proper intra-agency coordination, give JCS approval to interdepartmental plans and proposals for psychological warfare. A major JSPD function was supervising, even if not controlling, the military services' logistic planning for psychological warfare and their logistic support of current OPC operations. In fact, OPC pressure to have one central office to which OPC personnel and logistic demands could be channeled to the military with the expectation that they would be fulfilled, had been a contributing factor in JSPD's establishment. ^{40/}

OPC had been hindered in its covert operations by lack of military support. Equally important to OPC was the increasing danger to its operational security arising from the necessity of frequent, detailed explanations of its covert operations to the lower military supply levels to justify OPC requests for military aid. It was expected that JSPD participation in OPC policy and planning would give it the background on and justification for OPC's personnel and logistic requirements. JSPD might forward these requirements to logistic divisions with the official statement that they were in accordance with JCS plans and policy and hence they should be fulfilled. This procedure stopped unnecessary talk about covert activity, and it enabled JSPD to tabulate the requirements which OPC actually secured. JSPD could, therefore, not only insure that the military fulfilled their responsibilities, but it also could evaluate OPC operations in the light of the policies expressed and the materials provided. One limitation on JSPD's coordinating effectiveness was the fact that only in the person of the Chief of JSPD did overt and covert psychological warfare come together. On JSPD working level there were separate and fundamentally unrelated groups specifically limited to overt or covert operations. Another limiting factor on JSPD effectiveness was the confused status of JSPD in relation to the Psychological Warfare Subcommittee of JSPG. This issue did not arise in the first year because of the personality of the first Chief of JSPD, and because of JCS' interest in psychological warfare. However, JSPD's establishment vastly improved the handling of psychological warfare planning and coordination on the military levels. 41/

While JCS increased its psychological warfare personnel a single officer continued to handle the Navy's interest in psychological warfare planning and operations. Studies on psychological warfare and anti-submarine warfare were initiated in 1950 by the Navy. Extensive funds were provided by the Office of Naval Research for outside studies and evaluations of psychological warfare's possible contribution to this major interest of the Navy. The Air Force, with a Psychological Warfare Section of its Planning Division, continued to develop increasing emphasis on the logistic requirements and training programs for psychological warfare. In the Department of the Army, there was extensive recognition of the need for a psychological warfare organization but little seems to have resulted before the Korean incident. In early 1949, Wallace Carroll, who had had long OWI experience in World War II, prepared a study with recommendations on the Army's participation in psychological warfare. Immediate results were not forthcoming even though a complete reorganization of the Army's General Staff was being considered. The General Staff apparently continued to accept a former Secretary's viewpoint that psychological warfare was not a regular military activity and it should not concern the military until the shooting war started. The psychological warfare responsibilities of the Army, therefore, continued to be handled by two officers in the General Plans Branch of P & O, and subsequently G-3 of the General Staff. ^{42/}

^{42/} (TS) Tyler Port "Army Organization for Psychological Warfare and Special Operations", 12 April 1950. It is interesting to note his conclusion regarding the Army's interest in psychological warfare up until early Spring of 1950. He mentioned that the study "gave him the distinct impression that a feeling of hopeless frustration surrounds the entire history of postwar development...psychological warfare".

SECURITY INFORMATION

December 19, 1951

While the JCS action on JSPD had improved the position of the military on psychological warfare the State Department went through one of its perennial reorganizations which greatly improved its information program. The information program had been in State Department, but the information people felt that it was not of State Department. This situation underwent gradual improvement after a high-ranking Foreign Service Officer was brought back to the Department as the Assistant Secretary of State for Public Affairs. All developments in State's information program need not be considered but two are worthy of mention. A representative of the Public Affairs Sections (P Area) was assigned as a regular attendant at the State Department's policy staff discussions. Thereafter, planners of the information program were informed of, and could present their views on, policy as policy was in the process of formulation. This representation on the policy planning staff tended to give information people the feeling that they were a part of State's team. It also widened the horizons of State's planners so that they more readily considered the psychological reactions which might be expected. The policy planners had claimed that they always gave consideration to the psychological elements of policy. It can hardly be questioned, however, that the presence of an individual trained and responsible only for the psychological elements could not help but highlight these aspects to an extent which the policy planners concerned with all the other factors of policy formulation might not realize. What might appear as an insignificant development in intradepartmental organization tended to become a major factor in improving the position and the importance of the P Area and the Information Program within the Department. A second step, accelerating the appreciation of psychological activities, was the assignment of a Public Affairs Specialist to the geographic sections of State. Thereby each area secured a person

SECURITY INFORMATION
TOP SECRET

Page 76 of 95 pages

TOP SECRET
SECURITY INFORMATION

December 19, 1951

trained and knowledgeable in information activities who was also an integral and responsible part of the areas' operations.

The over-all effect of this partial decentralization of State's informational planning was beneficial. The geographic desks gave more attention to the information problems as a part of their regular activities. These specialists provided a sympathetic contact point in the major geographical areas for keeping the P area cognizant of major developments and general trends. Subsequently, it would seem that the decentralization temporarily weakened the planning staff of the P Area at a most unfortunate time. The Assistant Secretary for Public Affairs had selected his best people and assigned them to the geographical areas in order to make the best impression. This left the P areas without its better planners. This weakness was balanced by the fact that having assigned the responsibility of these informational planners to geographical areas, the transplanted information specialists, when adopted by the geographic areas, recommended approaches proposed by the P Area. The serious psychological problems arising at the outbreak of the Korean war were resolved by these information specialists on the geographic desks bringing into harmony the major objectives of the geographical areas with those of the P Area. These specialists performed capable information operations by getting the propaganda objectives in early and thoroughly discussed in each geographical area. The isolation of the P Area from policy formulation was, thereby, minimized.

Despite these intradepartmental developments, the status of IFIS had not fundamentally changed even under NSC-59/1 which had been approved by the President in early March 1950. IFIS continued to be plagued by interagency rivalries with the result that no constructive action

SECURITY INFORMATION

was taken prior to the start of the Korean action. Meanwhile, international developments had moved at an unprecedented rapid rate. The cold war was officially recognized as a non-military struggle for power by the Kremlin imperialists against the Western powers. The North Atlantic Treaty had been signed in a blaze of publicity directed at increasing the domestic and foreign appreciation of its significance. The North Atlantic Treaty Organization (NATO) was a milepost in fulfillment of NSC-20/4, unifying the military potential of the West in case of Soviet aggression. NATO's Council of Ministers could expand the military and political alliance into an economic unification.

American success in Western Europe was not matched in the Far East. The weakening of the Chinese Nationalist Government had become obvious and by the end of 1949, its continued existence in exile on Formosa was a matter of doubt. Since Marshall's failure in China in early 1947, American policy wrote off China as an area where we could do nothing. The White Book on China publically characterized the Chinese Nationalist Government as a useless encumbrance to our Far Eastern policy. Meanwhile, the long-disputed pretense of the Chinese Communists to be agrarian reformers wore thin as their power increased. Their anti-foreign, and virulently anti-American, policy and propaganda became more clearly evident. There were even indications that their anti-Americanism was proportionate to their pro-Sovietism. The increasing tensions in Europe and the Far East, and the emotional repercussions to Soviet's first atomic bomb caused American leaders, in early 1950, to reconsider national objectives and aims adopted in November 1948.

Acting on the Presidential directive, the Secretaries of State and Defense prepared a special report analyzing the existing crisis. This new study reiterated the basic NSC-20/4 position that the Kremlin's

SECURITY INFORMATION
TOP SECRETPage 78 of 95 pages

TOP SECRET
SECURITY INFORMATION

policy was a threat to American security. NSC 20/4 had visualized a four or five year period of critical tensions during which the United States and the Western powers could prepare their political, military and economic strength for a possible showdown with the USSR, if that nation insisted on war. Now, however, Soviet possession of the atomic bomb, their close alliance with Communist China, their stricter control over their satellites, all these indicated that the Kremlin was preparing for a more immediate showdown. The Secretaries of State and Defense, therefore, recommended that the programs, visualized in NSC-20/4, be immediately rushed to completion and that the United States and its Western Allies most rapidly improve their military position. This report initiated extensive NSC planning to develop budgetary estimates demanded by the expanded and accelerated defense program. While this planning was still in process, the Korean crisis of 25-27 June 1950 startled the nation.

What psychological considerations entered into the American decision to provide air and Navy cover for South Korean forces under the United Nations auspices, and subsequently to engage in police action, is not clear. The President's statements and subsequent public addresses indicate that the psychological factor was a major element in the decision to accept the Korean issue as Communist-inspired ruse which the West could only ignore with serious loss of prestige and influence. The Korean incident clarified American policy toward Russia and also raised psychological activities to a higher policy level.

While the Korean crisis gave increased emphasis to psychological operations, aggressive psychological warfare against Russian Communism had been developed and implemented prior to the Korean war. The entire

ECA Information Program, both its overt and covert activities, were the aggressive implementation of psychological warfare techniques and methods to counter Russian efforts to weaken America's position and to strengthen popular support for that position throughout the West. In State's Information Program, an increasingly aggressive attitude towards the Russians had developed sometime before the Korean incident. In 1948, State's guidance on the Italian elections had aggressively set forth the American position on expanding Communist power without mentioning Russia, or the Kremlin. In 1949, however, its directives were aggressively directed at Russian statements and Russian actions. In July 1949, State informed its information people that they were openly and explicitly to point out Russian lies and to point the accusing finger at the Russians. In the summer of 1949, the information people at the overseas mission were told to circulate American information even if it made routine diplomatic negotiations more difficult. Voice of America programs discrediting the Russians were developed and the number of Russian language programs increased. These signs indicated that the State Department was getting away from the old theory of the "fair and full" picture of America. ^{43/}

The pressure of international developments compelled the State Department to take a more aggressive attitude in its information program. Its proposal to counter Russian jamming of its VOA programs to Russia and Russian-dominated areas by increasing transmitters under "the ring plan" was indicative. ^{44/}

^{43/} Interview with Walter P. Schwinn and E. H. Kloman, Jr. The summary index of Public Affairs guidances and directives also indicates the trend toward "a tough attitude" toward Russia.

The "Campaign of Truth" was additional evidence of State's stiffening attitude toward Russia. It is not clear when and where the concept of the "Campaign of Truth" originated. The closer integration of the information program with State's policy planning must have made the P Area planners conscious of the background papers to the NSC-68 series. This reappraisal of American objectives toward the USSR explicitly listed an intensified information program as a policy instrument which would check possible Russian aggression. The P Area people had to prepare the detailed plans to implement this great effort. The public announcement of the "Campaign of Truth" was made by the President on April 20, 1950, but the basic principles underlying this campaign were visualized in the draft of NSC-68.^{45/}

In the political and psychological estimate of NSC-68 frequent mention was given to the psychological elements: to the power of American public opinion, to our own confidence and sense of moral direction, and to the necessity of stimulating similar feelings among our Allies. If Americans increased their own confidence and moral sense, they would evoke similar strength in our Allies and other free peoples. NSC-68, in providing for the acceleration of America's defense against Russia, explicitly urged

the development of programs designed to build and maintain confidence among other peoples in our strength and resolution, and to wage overt psychological warfare calculated to encourage mass defections from Soviet allegiance and to frustrate the Kremlin's design in other ways.^{46/}

The Campaign of Truth was prepared by the Public Affairs Section of State Department as part of the over-all political program to strengthen the international position of the Western powers, and yet to maintain the possibility of continued negotiations with Russia. Russian propaganda with its emphasis on Western war-mongering in contrast to Soviet peaceful intentions was putting the United States in an unfavorable psychological position. America could not refuse to negotiate with Russia, and America could not give the Russians a propaganda victory by requesting the Russians to negotiate. The Campaign of Truth, while it took a firmer attitude, would prove the basic falsity of Russian propaganda and emphasize that America's unchanging aims had always favored peace and adequate negotiation of all difficulties. The Campaign of Truth has been considered by many to be the real start of revived psychological planning within the Department of State.

Previous planning in this field had been on the basis of expediency and improvisations. When a crisis developed it was then decided how it might best be handled. The Campaign of Truth was, however, premised on fundamental goals and policies. The trend of developing situations would not change these goals and policies although the operational emphasis might be varied as it appeared to be most appropriate for the success of American policy. The planning of the Campaign of Truth was in a sense a revolutionary process within the P Area of the State Department. It appears to have been State's first effort to do detailed long-range planning. To determine areas of most immediate importance and within these areas the most effective targets for psychological activities, the world was divided into four major categories. Russia itself comprised the first category. While it was the most important target it was recognized as the area least

SECURITY INFORMATION
TOP SECRET

Page 82 of 95 pages

TOP SECRET
SECURITY INFORMATION

December 19, 1951

capable of being influenced by overt activity. In the second category were the satellite areas which provided possible targets for eventual successful psychological attack, but which in the immediate future had to be considered as areas wherein only the ground work for future attitudes might be prepared. Most importantly there were the peripheral areas around the Communist countries, i.e., that group of strategically important but neutrally inclined nations on whom the Communists might bring immediate and future pressures. This peripheral area was first subdivided into the immediately dangerous areas such as Western Germany, Iran, and Southeast Asia where existent Communist pressures could be recognized. Then there were the areas presenting longer term problems such as India, France and Italy, where danger of Communist pressure existed but where the general trend was in support of the Free World. Finally, there were peripheral areas, the Scandinavian countries and the Arab world, where the influential opinion had to be so prepared that these areas which were attempting to maintain neutrality in the cold war, would be sympathetic towards the Western world if a shooting war started. A system of priorities was developed for the handling of programs to these various areas together with detailed guidances on the strong and weak points of the American position in each separate area. In this way the Campaign of Truth was prepared in early 1951 as an integral part of national policy.

Concurrently with policy planning, the P Area was doing extensive technical planning. After preliminary private studies, it had proposed the "Ring" plan to counterbalance Russian jamming of VOA and BBC. New powerful transmitters would be established along the Iron Curtain to transmit and to relay American broadcasts with such volume and in such a pattern that peoples within the Communist sphere could hear the American message despite the most extensive Russian efforts to jam and

distort it. This program was detailed in the Annex to NSC-68/1 on the Information Program. It provided for a series of five-year appropriations averaging \$120,000,000 a year for the information program. The assumptions on which this information program was based were stated in the same document:

- (a) "USSR is waging psychological warfare against the Free World and its propaganda is a major threat to American Foreign Policy."
- (b) "The Free World's effort to counter USSR policy by political, economic and military means 'can obtain maximum results only if the psychological effect of these programs is beneficial to, and in support of, their objectives'".
- (c) "The psychological offensive based on truth is essential if the United States is to succeed in its foreign policy objectives."

The Annex then emphasized that the American information program must increase the Free World's psychological resistance to increased Soviet aggression, that it must create doubt among the peoples in the Soviet-dominated areas and develop "a community of interest" among the governments and peoples of the Free World so that they would act in a determined manner against Communist aggression.^{47/}

While State Department was reacting to the intensifying situation by developing its Campaign of Truth, inter-departmental coordination and planning under NSC-59/1 was not progressing. While State's P Area had been issuing weekly guidances from March 1950, it was not until July that inter-departmental coordination

and approval gave State guidances authoritative policy control over the psychological activities of the military services. With fighting in Korea and particularly during the first withdrawal of American and UN contingents southward, there was general agreement among the political and military leaders that the Korean action offered innumerable possibilities for psychological operations, if a national policy could be provided to coordinate the various service and agency activities in this field. State Department had a developed USIS activity in South Korea, operating on a peacetime basis, in June 1950. A psychological warfare planning nucleus had existed in the Intelligence Division of the Headquarters of the Far Eastern Command since 1949. When the Korean incident started, however, neither the USIS in Korea nor the psychological warfare staff in the Tokyo Headquarters had developed or coordinated a plan for cooperative operations in an emergency. People in USIS and also in the Headquarters Staff undoubtedly were familiar with the SWNCC 304 series that in case of war, State's informational facilities in theatres of operation would come under the theatre commander. This transfer took place within two weeks, although not without some harassment and injured feelings.

While the administrative problem of psychological activity was settled by this unification, the problem of psychological policy control remained. The theatre took the position that its psychological warfare division, aware of the tactical requirements and responsible to the theatre commander, should determine the psychological warfare plans. State's representatives agreed that the tactical situation was important. They insisted, however, that the type of operation in Korea was such that explicit and controlling political directives were needed from the State Department. Here in new form was the old

SECURITY INFORMATION

SECURITY INFORMATION

December 19, 1951

problem of World War II. Did the political agency, during actual military action even though not war, give directives to a theatre commander which would control his psychological warfare operations? It is not certain that the issue was ever raised in those words on the Washington level. The representatives of the Joint Chiefs of Staff, of the Military Services, and of P Area in State, were clearly conscious of this issue, particularly in light of the Korean incident being classified as police action and the peculiar personality factors in the Far Eastern Command.

The Washington solution for this issue was accomplished informally by using the departmental consultants to the Secretary of State under MSC-59/1. State obtained interservice and JCS agreement to its policy guidances on the government's information program on Korea. These guidances controlled Voice of America output from the United States and its relay points throughout the world. The same guidance was also sent through Army communications to the Theatre Commander in Tokyo as approved national policy on psychological warfare. In this way the theatre commander was provided with propaganda guidances coming, as far as he officially knew, from the JCS. Even with the best of communications, Washington could not conceive of the many tactical variances arising from the rapid retreat, and almost equally sudden offensive, of the UN forces during 1950. Policy differences arose between Washington and the theatre commander and also between the civilian and military members of his staff, but these differences were in the main passed off as details of implementation rather than basic policy problems.

As the Korean action commenced, the policy liaison between departments in Washington continued mainly on an informal basis. In mid-August, however, State Department publically announced the

SECURITY INFORMATION
TOP SECRET

Page 86 of 95 pages

TOP SECRET
SECURITY INFORMATION

December 19, 1951

establishment of a "National Psychological Strategy Board" to develop plans and guidances for the more effective implementation of America's foreign information program. The National Psychological Strategy Board was under the chairmanship of the Assistant Secretary of State for Public Affairs and consisted of the previously mentioned policy consultants under NSC 59/1 of the Secretary of Defense, the JCS and the Director of Central Intelligence. In addition, representatives of the National Security Resources Board and ECA joined in the discussions. This Board met weekly to discuss and give at least informal approval to State's weekly guidances. It also reviewed the psychological warfare planning activities of the IFIS staff. For example, in August, this Board recommended that additional research be started on balloons as possible means of getting American views to the Russian people if a war could not be avoided. 48/

Meanwhile the IFIS Staff had been attempting to develop an organization for psychological warfare planning during a national emergency. This was one of the three responsibilities assigned to IFIS under NSC-59/1 but at that moment, it was the only one on which State and Defense representatives in IFIS had some hopes of reaching an agreement. State officials were determined that any nucleus for peacetime psychological warfare planning be retained in the Department of State in view of Congressional legislation. On planning during wartime, JCS and the services wished to participate in policy planning as well as in coordination of psychological plans with military plans. State Department insisted that policy planning whether in peace or in war was the function of the Secretary of State. Because agreement could not be reached on the extreme positions and because

psychological planning during a national emergency seemed most urgent, IFIS eventually came up with a proposal which was sent to the NSC as NSC-74.

This paper was a State Department proposal. Psychological planning in an emergency should be performed by an independent agency, the head of which would be appointed by, and be responsible to, the Secretary of State. The proposal continued the existent interdepartmental liaison, suggesting a board of policy consultants representing JCS, the services, CIA and the State Department, with a permanent staff from these same departments to prepare and coordinate the detailed plans and recommendations for psychological activity. It provided that the Secretary of State would be responsible for the formulation of policy and for the coordination of policy and plans for overt psychological warfare with the JCS and with covert planning. The Secretary of State would also be responsible for the implementation and coordination of the national psychological warfare effort outside of military theatres. The JCS would be responsible for the execution and coordination of all psychological measures in military theatres. This State proposal was opposed by the military, particularly the Secretary of Defense and the JCS. In view of the Korean situation, which was not war and certainly not peace, the military wanted the proposed psychological strategy board to be an independent agency, responsible only to the National Security Council or to the President. During the Fall of 1950, the NSC Senior Staff attempted to reconcile these divergent views. Admitting failure on 28 December 1950, the Senior Staff, in its own paper, NSC-74/1, reviewed the arguments on both sides and requested an NSC decision whether the proposed psychological strategy board should be under the Secretary

SECURITY INFORMATION
TOP SECRET

Page 88 of 95 pages

December 19, 1951

of State or be an independent office under the National Security Council. ^{49/}

Paralleling but apparently independent of the State-Defense differences about the proposed new agency to plan and coordinate the American psychological effort was CIA's developing demand for clearer directives covering covert operations. It will be recalled that OPC of CIA was the agency under NSC-10/2 responsible for the planning and execution of covert operations to carry out national policy. To provide policy guidance, and necessary administrative support from the Department of Defense and the Department of State, a policy liaison committee representing the Secretaries of State and Defense had been explicitly authorized by NSC-10/2. When JSPD was established in January 1950, its chief was invited to these weekly policy liaison meetings. His regular attendance developed into an extra-legal membership on that policy committee. However, with the outbreak of the Korean incident and particularly with the approved national policy set forth in NSC-68/2, the increased demand for covert operations raised worrisome problems for the head of OPC and subsequently for the Director of Central Intelligence (DCI).

these covert activities, while directly authorized by NSC, required substantial increases in OPC personnel and funds as well as logistic support. These OPC requirements could only be provided by the Defense and State Departments since Congressional appropriations to CIA had been voted solely for its intelligence activities. The President's secret defense funds were not sufficient and it was not proper that they be used only for covert operations. There was also an administrative problem arising from these increased demands for covert operations. OPC would become a larger organization than its own administrative parent, Central Intelligence Agency. This administrative difficulty was a thorny issue in view of the unique arrangements which had been allowed to develop between the head of OPC and DCI. DCI, although authorized by NSC-10/2 to supervise OPC, had allowed OPC to go its own way. In the Fall of 1950 a new Director of Central Intelligence arrived. The new DCI determined that OPC would be an integral part of CIA and OPC would come under his policy, as well as administrative, responsibility. He also decided that if NSC wanted CIA to increase its covert activities, NSC should explicitly direct that the personnel and material support for such covert operations would be provided by the Departments of Defense and State. The CIA/OPC people, as well as the Director of Central Intelligence, also wanted more explicit policy guidance for covert activity from these Departments and from NSC. These covert problems were developing in CIA and being suggested to the NSC staff when that staff was concerned with the reconciliation of the State-Defense disagreement over the psychological strategy board. ^{50/}

^{50/} Interviews with appropriate CIA authorities, with John Magruder, Rear Adm. Leslie Stevens. There is a large file of OPC working papers on this problem which has been collected under the heading, (TS) "Magnitude".

December 19, 1951

The confusion in the covert psychological effort was brought to the attention of the National Security Council in early December. Central Intelligence was informed that the President was preparing to proclaim a state of national emergency. Covert operations under paragraph 4 of NSC-10/2 would then become the direct responsibility of the JCS. CIA desired to be certain that the National Security Council properly understood the implications of covert operations and that, if necessary, it would direct paragraph 4 in NSC-10/2 be held in abeyance. At an NSC meeting in early December the DCI presented this problem to the NSC as well as CIA's increasing responsibilities for covert operations. He clearly indicated the need for CIA having psychological policy directives interpreting the NSC objectives from an agency on a much higher level than the existing policy liaison committee. It is not clear what impression CIA's appeal had on the National Security Council. NSC did order that JCS' control of covert operations in case of a national emergency should be held in abeyance until this issue be further considered and a final decision given. There was no evidence of any NSC attitude on the requested policy directives to govern covert operations.

This CIA effort to improve the planning and administration of covert operations paralleled the disagreement between State and Defense on the psychological strategy board proposed in NSC-74. There was still another parallel development which seems to have substantially influenced the Presidential decision in early January to remove the issue of psychological operations from NSC. Congressional and public opinion had been anxiously aroused by the Soviet's atomic explosions. There had been Congressional proposals that the enormous appropriations for national defense and atomic development might better be used for overseas informational programs which might wean

SECURITY INFORMATION
TOP SECRET

SECURITY INFORMATION

December 19, 1951

the world and even Russia away from aggressive action. There had also been serious Congressional discussion of an intensified American psychological effort to weaken the Russian position. With the blessings of State Department's Public Affairs people, Congress was considering a series of resolutions proclaiming America's continuing friendship for the Russian people as distinct from the Kremlin. It was hoped that such official statements might develop a psychological cleavage between the Russian people and their leaders. Similarly, in discussions of continued recovery aid there had been increased attention given to the use of such funds to entice the Russians and their satellites to peaceful cooperation with the Western powers. There were also rumors that Congressmen and influential business leaders were organizing to push for a stronger American psychological effort to counter the apparent Russian victories in the world-wide propaganda war. The National Free Europe Committees, more widely known by its well publicized Radio Free Europe, attracted a great deal of public attention in the Fall of 1950. In Congressional discussions, there were invidious comparisons between the approach of Radio Free Europe, a private adventure, and the official Voice of America in their respective programs to the Russian people. These elements raised the specter of a Congressional decision for an American psychological warfare organization.

It is not now possible to estimate the influences which resulted in the President's decision on NSC-74/1. The NSC staff had requested that the National Security Council decide whether the proposed psychological strategy board should be responsible to the Secretary of State or be an independent body. It is not clear whether the NSC made any recommendation to the President, but it is reported that the President, having already considered setting up an independent board, informed the

SECURITY INFORMATION

Page 92 of 95 pages

TOP SECRET
SECURITY INFORMATION

December 19, 1951

NSC on 4 January 1951 that he was requesting the Director of the Bureau of the Budget and Admiral Sydney Souers to study and resolve the question for him. The President indicated that he was disgusted at the interagency bickerings and the continued inability of his two major executive departments to settle their own problems. He was, therefore, taking it out of the interdepartmental discussion and he would make a personal decision. However, months were to elapse before Souers and Lawton, the Director of the Budget, came up with the desired directive establishing an independent psychological strategy board which was approved and promulgated by the President on 4 April 1951. ^{51/}

It would appear that the President had determined to establish a separate board for psychological activities before he assigned Souers and Lawton their task. During the subsequent three months, all the old arguments representing the positions of State, Defense and CIA were hashed over with Souers. Some Bureau of the Budget people were opposed to another separate agency. Defense and CIA apparently were in independent agreement on the desirability of an agency separate from State with coordinating authority but without operational responsibilities. Representatives of State long argued that any independent body must necessarily conflict with the policy planning prerogatives of the Secretary of State. State suggested that its existing National Psychological Strategy Board fulfilled all the functions and requirements of a new agency, if only the NSC or the President would formally sanction it. The "give and take" of the various positions was evidenced in the many revisions of the

^{51/} Interview with Rear Adm. Sydney Souers, USN, (Ret.)

SECURITY INFORMATION
TOP SECRET

Page 93 of 95 pages

December 19, 1951

draft directive. ^{52/}

Eventually in late March 1951, there was general, but not enthusiastic, agreement on a directive to establish a Psychological Strategy Board (PSB). This directive was approved and promulgated by the President on 4 April 1951. Like most government action, this directive was a compromise. PSB was an independent entity, but PSB actually was a committee of the top policy officials of the three interested agencies: State, Defense and CIA. An independent Director would be appointed by the President to provide a responsible person to present papers to the PSB and to execute its decisions. However, the directive explicitly stated that PSB and its staff would not become an operating agency. PSB was authorized to plan psychological operations on the strategic level of the NSC, to coordinate the implementation of the psychological strategy by the operating agencies, and to evaluate the results of the entire psychological effort in its fulfillment of national policy. Finally PSB was authorized to report directly to NSC and to the President. The major accomplishment of the directive for PSB was that interdepartmental planning and coordination in the psychological field was raised to a much higher level, just below the NSC but with a tenuous connection to the President. IFIS, and IFIO, under the NSC-43 and 59 series had been under the departments. PSB now was in a sense on a level parallel with, if not equal to, the departments.

The President approved PSB's establishment on 4 April 1951 but additional months elapsed before PSB met and its staff was organized. Hence, after four years of unsuccessful interdepartmental discussions about America's psychological activity, the separate interdepartmental

Foreword

From a military commander's perspective, the role of psychological operations (PSYOP) in the successful planning and execution of modern military operations is absolutely essential. The recent successes of PSYOP in Panama and the Persian Gulf amply demonstrate its importance in achieving our military objectives and national goals. PSYOP is an integral part of the United States Special Operations Command mission. Today, the military faces a dynamic and unpredictable world. PSYOP will remain a valuable instrument in our overall defense posture and will be a key asset in the fulfillment of US national policy.

Psychological Operations: Principles and Case Studies serves as a fundamental guide to PSYOP philosophy, concepts, principles, issues, and thought for both those new to, and those experienced in, the PSYOP field and PSYOP applications. This book clarifies the value of PSYOP as a cost-effective weapon and incorporates it as a psychological instrument of US military and political power, especially given our present budgetary constraints. The authors contribute to the understanding of psychological operations by presenting diverse articles that portray the value of the planned use of human actions to influence perceptions, public opinion, attitudes, and behaviors so that PSYOP victories can be achieved in war and in peace. The four sections classify articles with related themes into a common category.

Part I offers an overview of the nature and scope of PSYOP and serves as an introduction to the overall nature, historical background, concepts, and principles of psychological operations. These independent articles, which reflect the broad scope of historical development and thought about PSYOP, are intended to be a foundation for understanding the basic nature and key elements of PSYOP.

Part II follows with issues and influences related to developing effective US strategy, doctrine, and structure for conducting psychological and political warfare. The authors focus on those

psychological issues and roles that have been recurrent as our national policy, objectives, and strategy have been formulated and implemented. They explain historical and contemporary elements of the national policy process and the framework within which national PSYOP policy is formulated, administered, and implemented.

Part III deals with the objectives and activities of strategic, tactical, operational, and other types of PSYOP. These authors emphasize that all forms of PSYOP should primarily support the attainment of national policy and objectives. They conclude that the key to all US PSYOP is credibility of the message as defined by the influencing or changing of perceptions, 'attitudes, and behaviors through utilization of words and actions.

In Part IV the authors use case studies to present and clarify PSYOP goals, roles, and methods. One of the editors of this book condenses and analyzes (1) US and Vietcong PSYOP in the Vietnam War and (2) the Iraqi propaganda network. The other writers examine tactical and consolidation PSYOP activities in Operations *Just Cause* and Promote *Liberty* in Panama. They address (1) our national antidrug policy and its relationship to the role of military psychological operations and (2) the importance of the political-psychological dimensions of conflict and insurgency.

By addressing the breadth and depth of psychological operations thought, this collection of PSYOP articles serves as a valuable knowledge base for those who read it. A major purpose of the book is to pull together those previously published articles under one cover in one volume. *Psychological Operations* should stimulate your thinking and reinforce the value of PSYOP.

A handwritten signature in black ink that reads "Frank L. Goldstein". The script is fluid and cursive, with the first letters of each word being capitalized and prominent.

Dean of Research
Air Command and Staff College

Preface

This book explores the breadth and depth of fundamental PSYOP roles, principles, and methods. Many of these readings were previously published in professional journals. *Psychological Operations: Principles and Case Studies* is not a collective work and does not attempt to be. Each article is an independent effort and together they represent a cross section of what the "best and brightest" feel is key to both offensive and defensive psychological operations. What the 24 contributors share, besides their own particular expertise in PSYOP, is a recognition that a clear understanding of PSYOP is important to our national defense and to the way PSYOP should be conducted in the future.

Understanding PSYOP is not a simple task. Historically, both military and civilian discussions of PSYOP throughout the leadership spectrum have regularly substituted cliches, myths, and untruths for hard evidence or analysis of what PSYOP is and how it can serve our national objectives. PSYOP policy and doctrine have not received their deserved attention while hostile PSYOP efforts against the US are misunderstood and often ineffectively countered.

Although the Soviet threat has ended, three Soviet PSYOP articles are deliberately included because the classic Soviet PSYOP model has been taught and integrated into third world countries all over the world and will continue to be an influence in the international arena.

In 1984, a major effort began to revitalize the state of psychological operations in the United States. That effort was spearheaded in 1985 by a document known as the DOD PSYOP Master Plan. The plan evolved over several years and revision began again in 1990, just prior to the Persian Gulf War. The plan directed the overall revitalization of US psychological operations; it directed that PSYOP be fully integrated into planning and military operations; it directed that PSYOP be considered for immediate and effective use in crises and hostilities; and it directed the use of overt PSYOP programs in

peacetime. The plan presented an across-the-board baseline of problem areas and laid out specific remedial actions for fundamental improvements in our capability to employ PSYOP in peace, crisis, and war.

This volume is also an ongoing effort. While the collected articles will expand both the knowledge and understanding of psychological operations past and present, many of these authors would not have written their articles without the initial revitalization-and Air University Press may not have published them had they been written. The essays present critical PSYO'p issues, problems, activities, and techniques in the book's four sections, which classify articles with related themes into a common category.

We must underscore the fact that these essays are independent of each other. Many were written and published decades ago, and most were originally published in differing formats with differing style requirements. Those that were written in the present tense years ago have been edited to reflect the past tense. We have retained the original flavor of each essay, but some style changes have been made to conform more closely to current Air University Press style. Some essays have notes, some don't; some have bibliographies, some don't; some have appendixes, some don't. We have retained the original styles, with this exception: Notes number 1 that appeared at the titles of some original essays have been removed and the references thereto have been moved to the bottom of the first page.

We are grateful to the 24 contributing authors and regret that we could not include biographical information on all of them; unfortunately, we were unable to obtain biographical data on Preston S. Abbott. We thank J. Schmier, B. Karabaich, and C. Williamson, who provided assistance to MSgt Blair and Col Goldstein, and we are especially grateful to Maj Thomas P. Sands, Florida ANG, who provided editorial assistance to the entire project in its early stages. We also extend our gratitude to those who provided outstanding administrative and technical support. In particular, Majors Stephen Asher, USAF, and James V. Keifer, USAF, Retired; Ms Victoria L. Blessing and Ms Eva E. Hensley; SFC Roger D. Crocker, USAR; SSgt Sherri Adler, USAFR; Sgt Manuel D. Gonzalez, USAFR; and A1C Jayme L. Laurent, Florida ANG.

PART I

Nature and Scope of
Psychological Operations
(PSYOP)

Introduction

The scope of military PSYOP during World War II, the Korean War, and in much of the 1960s was primarily limited to combat propaganda and psychological warfare (psywar). During those times, it was accepted as a specialized tactical application and as a subordinate operation. The experiences of these conflicts, especially the Vietnam War, convinced some American military and political leaders that the psychological dimension of national power and conflict encompasses diverse elements 'and many activities-nonmilitary as well as military-in both peacetime and war in support of our national policy and objectives. Its scope can vary from the tactical battlefield to the operational theater to the strategic levels of conflict to national political and military goals.

Part I serves as an introduction to the overall nature, historical background, and concepts of PSYOP, and to some principles that can be used for training in the field of psychological operations. The independent articles in this section reflect the broad range of historical development and thought about PSYOP and are intended to be a foundation for understanding the basic nature and key elements of PSYOP.

Col Frank L. Goldstein, USAF, and Col Daniel W. Jacobowitz, USAF, Retired, provide a general introduction to and a commonly accepted definition of PSYOP. The authors explore the three types of PSYOP and give several examples of strategic, tactical, operational, and consolidation PSYOP. They divide propaganda into white, gray, and black classes, and present the various resources of psychological operations. The six major military objectives of PSYOP are condensed for the reader.

The late Col Fred W. Walker, USAF, Retired, presents strategic concepts for military PSYOP to enhance the overall understanding of the PSYOP dimension and its challenges. His emphasis is on the public's understanding that the US government does not engage in public disinformation activities in pursuit of national policy. He addresses strategic rather than tactical battlefield and operational PSYOP. He focuses on the concept that "truth is the best propaganda" and analyzes

efforts to counter Soviet global disinformation. Walker died before the dissolution of the Soviet Union; however, the article represents a clear and precise use of Soviet PSYOP between 1917 and 1990.

Col Alfred H. Paddock, Jr., USAF, Retired, provides a brief perspective on the evolution of military PSYOP. He addresses the 1985 Department of Defense (DOD) PSYOP Master Plan as the major framework for rebuilding worldwide military PSYOP capabilities in support of national objectives in peace and crisis and at all levels of conflict. Colonel Paddock presents several essential themes for remedial actions-developing comprehensive joint PSYOP doctrine, developing an adequate number of #PSYOP planners on joint staffs, and improving commanders' understanding of PSYOP capabilities and missions.

Col Benjamin F. Findley, Jr., USAFR, analyzes the many similarities between civilian business marketing and military PSYOP. His premise is that, just as marketing and promotion processes in business have dedicated necessary resources and utilized persuasive strategies and tactics to successfully influence perceptions, motivations, attitudes, and opinions to achieve results, so military PSYOP can and should employ similar approaches to market our country. Colonel Findley focuses on basic persuasion and marketing principles and on business lessons learned.

Psychological Operations

An Introduction

Col Frank L. Goldstein, USAF

Col Daniel W. Jacobowitz, USAF, Retired

If your opponent is of choleric temper, try to irritate him. If he is arrogant, try to encourage his egotism. If the enemy troops are well prepared after reorganization, try to wear them down. If they are united, try to sow dissension among them.

– General Tao Hanzhang; translated by Yuan Shibing
Sun Tzu's Art of War: The Modern Chinese Interpretation

PSYOP is a vital element within the broad range of US political, military, economic, and ideological actions. Properly employed, PSYOP reduces the morale and combat efficiency of enemy troops and creates dissidence and disaffection within their ranks. Psychological operations can promote resistance within a civilian populace against a hostile regime or be employed to enhance the image of a legitimate government. The ultimate objective of American PSYOP is to convince enemy, friendly, and neutral nations and forces to take action favorable to the US and its allies. Because of the nature of the parent society and the comparative ease of detecting falsehood in a multimedia world, US overt PSYOP campaigns are limited to presenting factually correct material. It would be disingenuous to claim that a balanced picture is presented in US propaganda, but the actual material presented in any particular overt PSYOP message will be verifiable against independent sources.

Truth and falsehood in propaganda must be separated from overt and covert operations and the issue of white, gray, and black (false) propaganda. Overt propaganda is produced by a government or organization that takes responsibility for it. Because of police state conditions or tactical considerations, it

may have to be disseminated by covert means, such as agents who risk their lives to transport and distribute the materials. Overt propaganda may be true or false. Since the effect of propaganda depends on credibility, overt sources that utilize falsehoods quickly lose all effectiveness. Overt propaganda is also known as white propaganda because the source takes responsibility for it. Gray propaganda is material that is distributed without an identified source. It may be true or false. Black propaganda is material produced by one source that purports to have emanated from another source. Such covert productions may be used to damage the credibility of a white (truthful) source by disseminating obvious falsehoods under the label of the previously trusted source. Black propaganda-if effective at all-quickly loses effectiveness unless the populace is particularly susceptible to rumors, manipulation, and distortion of fact. Nevertheless, black propaganda can be highly effective if properly planned. For example, should intel sources determine that an invasion is imminent, broadcasting that fact under an aegis purporting to be that of the potential invader removes all surprise and falsifies all the invader's claims of a "just" war.

Propaganda may legitimately be economical of the truth. For example, in describing the triumph of democracy there is no particular obligation to discuss the role of Boss 'tweed in urban politics.

Military psychological operations are inherently joint operations. Unified, joint task force, and other military commanders identify target audiences and develop PSYOP themes, campaigns, and products. These are submitted through channels to the joint chiefs for approval. The principles of developing a PSYOP campaign are applicable across the operational continuum. Although the complexity of the methodology varies with the level of conflict, considerations for development of PSYOP campaigns are the same for counterterrorism as they are for global war.

The psychological dimension covers the battlefield as well as the effects upon the soldiers fighting the battle, their military leaders and staffs, the political leaders, and the civilian population. On the field of battle, US forces want to face an enemy who is both unsure about his cause and capabilities

and sure about his impending doom; an enemy who, even if unwilling to surrender, has little will to engage in combat.

It is US policy that psychological operations will be conducted across the operational continuum. It must be understood that psychological operations are conducted continuously to influence foreign perceptions and attitudes in order to effect changes in foreign behavior favorable to US national security objectives. Any type or level of PSYOP can be conducted at any point along the operational continuum. The operational environment in which psychological operations are conducted does not, by itself, dictate or limit PSYOP actions or the level of PSYOP applied.

In environments short of declared war, national PSYOP policy is normally derived from official policy statements and declarations on US foreign policy as well as national security policy. Interagency coordination is required. During declared war, the policy emanates from the national command authorities (NCA) upon approval of plans submitted by the Office of the Secretary of Defense (OSD). This national policy is executed through a strategy of coherent international information programs, which consist of US information dissemination efforts dealing with policy and information. It is essential that PSYOP themes and products reflect and support national policy, these overt messages are as official as any White House press release. Therefore, appropriate PSYOP policy and strategy must fully integrate Department of Defense (DOD) PSYOP into these international information programs to alleviate the potential for disseminating contradictory information.

Psychological actions such as show of force, cover, and deception have been used throughout history to influence enemy groups and leaders. Modern psychological operations are enhanced by the expansion of mass communication capabilities. Nations can multiply the effects of their military capabilities by communicating directly to their enemies a threat of force or retaliation, conditions of surrender, safe passage for defectors, incitations to sabotage, support to resistance groups, and other messages. The effectiveness of this communication on the target audience depends on their perceptions of the communicator's credibility-does the

communicator have the capability to carry out the threatened actions?

PSYOP actions convey information not only to intended target audiences but also to foreign intelligence systems. Therefore, PSYOP messages must be coordinated with cover and deception plans and activities, along with operational security planners, to ensure that essential secrecy is realized and that PSYOP messages reinforce cover and deception objectives. Skillful content analysts can determine overall intentions by carefully analyzing PSYOP messages and PSYOP planners can screen their own products to ensure that only the overt intention is broadcast. The methodology of overt propaganda analysis is arcane and difficult, as much derived from art as science. Some practitioners believe the method is more valid when aimed at totalitarian propaganda than PSYOP produced by democracies. Democratic propaganda normally is far less patterned, possibly because the products reflect a less organized process-ad hoc arrangements, swiftly evolving policies, lack of hidden agendas, or, frequently, no agendas at all. Totalitarian-especially communist-propaganda may be easier to analyze because it is highly formalized and patterned.

There is a psychological dimension within any element of national power projection, particularly the military element. Foreign perceptions of US military capabilities are fundamental to strategic deterrent capability. Therefore, US policymakers must articulate our national and military actions (if we don't, others will). Communicating unambiguously to allies, enemies, and neutrals is a key element of US national strategy. The effectiveness of deterrence, power projection, and other strategic concepts hinges on our ability to influence the perceptions of others.

For these communications, any player in the US government or overall body politic may become an important tactical element regardless of the strategic position that the player holds. In conveying the will of the United States, the firm set of the president's jaw in drawing "a line in the sand" may have as much influence on international, and especially adversarial, understanding of US policy as the actions taken by the government. Supporting statements by other officials, including the secretary of state, congressional leaders, and

military commanders, similarly are tactical elements carrying out the information strategy. Tactical actions of this nature, delivered at the strategic level, are analogous to the actual tactical delivery of weapons to targets of a strategic nature in a shooting war. Since much of policy is devoted to achieving national goals while ameliorating genuine conflict and avoiding a shooting war, tactical performance of these roles by strategic elements of the political/ military system is critical to national policy. One of the benefits of the open political process-disseminated and monitored by a free and aggressive media-is that individuals who would be inadequate tactical communicators tend to be shunted away from positions for which the nation's fate requires skillful performance. Military PSYOP may be undertaken at the strategic level, augmenting other national communications systems, particularly in areas for which the peacetime national systems-such as the United States Information Agency-have no access.

In every case, it is crucial that military PSYOP be integrated with other national communications, since the audiences will accept military PSYOP messages as official positions. To ensure this process, military psychological operations rely on a planned, systematic process of conveying messages to, and influencing, selected foreign groups. The messages conveyed by military PSYOP are intended to promote particular themes that result in desired foreign attitudes and behaviors. Therefore, PSYOP may be used to establish and reinforce foreign perceptions of US military capability, determination, and responsiveness to US political goals and to support overall US policy.

Psychological operations are an important dimension of overall military operations. They may be used by commanders to influence the attitudes and behavior of foreign groups in a manner favorable to the achievement of US national objectives. Thus, the principal purpose of DOD PSYOP is to persuade foreign audiences to change or enhance attitudes or behaviors in a manner favorable to one or more national security objectives. Additionally, PSYOP can counter foreign propaganda that adversely affects the achievement of US objectives.

The United States typically distinguishes between PSYOP on a strategic level and PSYOP on a tactical, battlefield level.

Strategic psychological operations are usually considered an aspect of public diplomacy and are normally established and guided by intergovernment working groups created for a particular short-term situation or regional area of concern. The intergovernment groups meet periodically to clarify strategic PSYOP policy in light of political and military developments of the day. At the present time, however, the US government has no permanent mechanism to institutionalize this process.

In tactical or battlefield PSYOP, commanders use such techniques as loudspeaker broadcasts and leaflet drops with the intent of generating a force multiplier without having to increase force size. Psyopers support tactical deception, counterterrorism, counterpropaganda, and other nontraditional means as the tactical situation merits. PSYOP messages cannot replace tactical performance or redeem inadequate training, weapons, or tactics that result in poor combat performance. However, the methodology can increase the overall functional degradation of enemy capability. Missiles, bombs, bullets, and maneuvers establish the context for PSYOP multiplication and hastening the cumulative results of tactical competence. Psychological operations speed the positive effects of military prowess, and may, under certain conditions, delay the consequences of military failure. Because psychological operations multiply desired effects, positive outcomes can result in quicker victory at lower cost in material, time, and casualties. Whether strategic or tactical, PSYOP uses any available means of communication to achieve desired ends. In Western circles, truthfulness is a desirable goal in itself, and is the principal means for building credibility among targeted audiences. Success in PSYOP rests on thorough analysis and planning.

Modern PSYOP planning includes a target analysis that consists of several phases. The first phase identifies possible target audiences. Once the target audience is identified, such target characteristics as vulnerabilities, susceptibilities, conditions, and effectiveness are analyzed. Vulnerabilities are the four psychological factors that affect the target audience: perception, motivation, stress, and attitude. Susceptibilities include the degree to which the target audience can be

influenced to respond to the message it receives. Conditions of the target audience include all environmental factors-social, economic, political, military, and physical-that influence the target audience. Audience effectiveness is the capability of the target audience to carry out the psyopser's desired response. The concept of audience effectiveness is fundamental to PSYOP success at strategic and tactical levels. If the goal is functional destruction of an enemy tactical unit, the effective audience may be individual soldiers, who may be persuaded to desert, defect, or defect in place; that is, simply fail to perform without overtly resisting their commanders. Other goals may require finding different effective audiences. The responsive audience in a battlefield air interdiction campaign could be the civilian workers who repair damaged railroads and bridges. Truthfully reporting that they are at risk from restrikes of previously damaged targets may dissuade them from voluntarily working. However, if they are slave laborers, the audience may be nonresponsive regardless of their susceptibility. The responsive audience may be taskmasters, or high-level commanders. For example, the susceptibility of the high-level audiences may be threats of war crimes prosecution. Both audiences will have to be convinced, by multiple messages, if the campaign is to be effective. Once the above analysis of audiences is accomplished, the psyopser seeks to determine the specific psychological plan that supports the national objective.

Psychological operations have been a part of military strategy since armies first took the field of battle. The Persian Gulf War and the employment of PSYOP by both sides were the most recent chapter in a long history of PSYOP as an integral part of military strategy. Throughout much of military history, PSYOP's presence has been felt in battlefield campaigns. Psychological operations were integrated into the commander's scheme of maneuver before the label of PSYOP was invented and without the benefit of thorough or scientific planning. An early example of how PSYOP was planned and applied in ancient battle is contained in the writings of the Chinese strategist Sun Tzu, who stated that the most noble victory was to subdue his enemy without a fight. Another was the successful exploits of Genghis Khan (the Mongolian

general Temujin), who would soften his enemy's will to resist by spreading rumors about his own army's strength and fierceness. His planning was simple and, seemingly, relevant and effective.

As early as the Battle of Bunker Hill, colonial military PSYOP operators used leaflets designed to work on the susceptibilities of the effective audience. Leaflets distributed among British troops in Boston by trusted colonial agents were based upon analysis of the situation and the conditions the British troops anticipated, as well as their motivation. Thus, some leaflets reported that food and provisions among the colonial troops were far superior to the hardtack fed the British, and that switching sides would result in an immediate improvement in diet. More important and effective was an appeal to a basic desire to improve the British soldier's status in life, an important factor in motivating enlistment. Many troops had joined merely to obtain subsistence or with the hope of achieving enough riches to obtain farmland. The most effective message slightly pointed out that to obtain land in the colonies, a soldier needed merely to desert and walk west until he found a suitable plot. Hessian mercenaries in particular responded to this appeal later in the war, and a considerable number of the present-day Pennsylvania Dutch owe their ancestry to the effectiveness of this appeal as these soldiers settled in a language-compatible area in which they were unlikely to be turned over to British authority. Colonial strategic psychological operations were masterful from inception, with Thomas Jefferson and Thomas Paine effectively working their various chosen audiences while Benjamin Franklin used his post in France to bolster not only continental support-which eventually resulted in the Franco-American force that was victorious at Yorktown-but also helped bring Lafayette, Pulaski, and Kosciuszko to American shores. The campaigns within Britain that drained political support for the war were most effective. Battlefield competence was important to the success of this effort and included not only victories at Trenton and other places but also the amazing raids by John Paul Jones upon English coastal towns, whose political effect far outshone their minimal military importance. James H. Doolittle's raid on Japan-undertaken for the same purposes

and with analogous military results-was foreshadowed in methodology and in equivalent technological means almost 150 years before.

In the American Civil War, both sides of the conflict directed strategic campaigns at England in the hope of winning support for their respective causes. It remains questionable, however, that these campaigns had been formally planned and that the proper resources were marshaled to execute them. The Southern campaign was virtually undercut by the Confederate refusal to sell cotton to Great Britain. This economic suicide overwhelmed any positive effects that media campaigns may have engendered.

During World War I, PSYOP came into its own as a formal activity. Almost all countries involved in the war used forms of strategic and tactical PSYOP. Many countries formed military units specializing in propaganda. These units' primary duties included distribution of leaflets by balloon and aircraft. The linkage among planning, resource mobilization, and execution by these agencies appeared to be an uncomplicated matter. How the PSYOP details were integrated into the shooting war of the day, or how well PSYOP induced surrenders, was not recorded for history. What is known, however, is that surrenders occurred with a positive correlation to PSYOP activities. Thus, military analysts began taking a new look at PSYOP as an ingredient with surprising impact on the battle. Psychological operations were a resource because they induced stress on both civilian and military forces of the enemy.

During World War II, propaganda activities became known as psychological warfare (psywar). Public broadcast radio, about 20 years old at this point, was called into play. Tank-mounted loudspeakers with a range of approximately two miles amplified the ability of the human voice to reach opposing combatants. Besides media programs, military actions were undertaken for their PSYOP effect. The Doolittle raid against Japan was considered an important PSYOP event for at least two reasons. The carefully planned raid demonstrated credibly to the Japanese that the US could reach and bomb their homeland, prompting them to take unnecessary steps for home defense. More important perhaps, news of the

success back home caused morale to soar in an American population desperate for a victory. Planning, mobilization, and execution all worked in this one instance. However, it must be noted that during this war, aircrews frequently expressed reluctance to risk themselves on leaflet-dropping missions because they lacked confidence in that methodology as a means of bringing victory nearer.

In the years that followed, PSYOP matured as a combat force multiplier, albeit through a series of starts and stops. During the 1950s, the Soviet Union made great strides in both strategic and internal PSYOP. Soviet client-states began very elaborate psychological operations for foreign insurgents and home consurhption. At the same time, little was apparently being planned in Western PSYOP circles.

Although strategic and tactical psychological operations were effectively integrated by the North Vietnamese during the Vietnam era, US PSYOP planning was not effectively formalized or coordinated with operations and troop mobilizations. It was in Vietnam that propaganda activities assumed the current term PSYOP-and television was a new medium. The North Vietnamese mastered the art of using the international media, particularly television, for their PSYOP. The US government was ineffective in both public information and public policy in mobilizing its public for the war. As a result of this negative experience in Vietnam, the US government learned the importance of domestic and foreign support of major policy goals.

In the more recent conflicts, PSYOP has been integrated with combat operations. In the Falklands, Afghanistan, Africa, South and Central America, Grenada, Panama, and the Persian Gulf, PSYOP was included by all parties. PSYOP even became a critical part of the terrorist mode of operations during the seventies and were part of the Iraqi PSYOP plan when they threatened terrorist activities.

Any student of PSYOP will quickly learn how important PSYOP can be in political and military strategy. What every student should strive for is an internalization of the concept proposed by Sun Tzu, the Chinese military strategist, that to fight and conquer in all your battles is not supreme excellence; supreme excellence consists of breaking the enemy's

resistance without resorting to fighting. Because soldiers and civilians have not fundamentally changed in nature or psychology since Sun Tzu wrote these observations, they remain appropriate today.

Strategic Concepts for Military Operations

Col Fred W. Walker, USAF, Retired*

For many years, people have indicated a lack of understanding ~of exactly what military psychological operations (PSYOP) entail. News media refer to PSYOP as psychological warfare (psywar) and imply that there is some nefarious objective or purpose in such action. They usually indicate that there is some element of deliberate misinformation-or even some public lies-involved in such activity. It is time that these misperceptions were set straight. The public must understand that the United States government does *not* engage in public disinformation activities in pursuing national policy. This article concentrates on peacetime strategic concepts, setting aside the loudspeaker and leaflet activities of the battlefield.

Joint Pub 1-02, *Department of Defense Dictionary of Military and Associated Terms* (1 December 1989) broadly defines strategic psychological activities as "planned psychological activities in peace and war which normally pursue objectives to gain the support and cooperation of friendly and neutral countries and to reduce the will and the capacity of hostile or potentially hostile countries to wage war."

This is demonstrably any program that supports a long-term effort to achieve a national or regional foreign policy objective through persuasion. We might consider the term *persuasive communications* to mean the same thing as psychological operations.

How did we become focused on strategic psychological activities? Quite fundamentally, various administrations assessed that the United States was falling behind in world

*Deceased 1990.

influence because the global propaganda and disinformation efforts of the Soviet Union were directed against US foreign policy objectives. As a result of this assessment, President Ronald Reagan directed the Department of Defense (DOD) to revitalize its psychological operations capabilities and use them to support national security objectives in all legal and proper areas.

Secretary of Defense Caspar W. Weinberger ordered an extensive study on how best to implement the president's direction. This action resulted in a master plan to revitalize military capabilities and better apply them to support long-term peacetime national security objectives. Key elements in his plan involved (1) separating the profession of PSYOP from the more narrow field of special operations and (2) significantly restructuring staffs and units. He also recommended enhanced interagency coordination.

It is important to stress the fact that US military psychological operations in peacetime do not involve misinformation or anything related to the Soviet concept of disinformation. Truth must be our guideline in every undertaking. After World War II, Dick Crossman, the British master of international influence activities, counseled that truth is the very essence of strategic peacetime foreign policy efforts and that it should be our fundamental guideline. US policy must endorse his astute recommendation.

DOD is still engaged in a period of transition to revitalize its military PSYOP capabilities. We envision a number of strategic roles and missions, all of which support objectives derived from published national security policy.

According to the annual defense guidance document, our fundamental national security objective is to deter conflict. This is clearly a psychological phenomenon because it occurs in the mind of a potential enemy. When an enemy perceives that it would be too costly for him to attack or that he would probably lose if he started a war, then he elects not to attack and conflict has been deterred. His mental decision, based upon his perception of our capabilities and resolve, is the key element in the process of deterrence. Military PSYOP in support of this fundamental defense objective, then, should seek to clarify and focus this perception.

Military PSYOP programs designed to enhance deterrence should include those that support arms control talks as well as those that clarify and explain national aims for strategic nuclear force posture. Efforts to clearly describe our policies for peaceful military uses of space and the strategic defense initiative (SDI) can readily be listed as contributing to deterrence. The fact that the term *star wars* was publicly attached to the SDI program aided the Soviets considerably in their propaganda campaigns against it. There were two reasons for this: (1) the term evoked subconscious perceptions of science fiction and fantasy among various public audiences and (2) "wars" is perceived as aggressive rather than defensive. As a result, there was little support for the program. Nevertheless, little was done to decouple this negative terminology. In the future, more must be done to properly support national policy.

A simple thing like terminology can indeed be a major factor in various public audiences' acceptance of-or support for-any policy. Recent history shows that the term *neutron bomb* was a key element in the Soviets' eminently successful campaign a decade ago to prevent President Jimmy Carter from deploying enhanced radiation weapons in Europe. In like manner, we can recall how our national leaders were duped into referring to Iranian terrorists and kidnappers as students at the outset of the Iranian Embassy hostage debacle in 1979. These are clear examples of how terminology can sway public perceptions on a global basis.

Certainly, strategic military PSYOP programs should play a significant role in countering terrorism. In addition to gaining some control over media terminology, we need information programs that will disassociate terrorist groups from pockets of popular support. Such programs should publicly impugn the worth of the terrorists' objectives and denigrate their leadership. We should also seek to reduce their internal cohesion and cause them to waste their resources defensively; for example, in hiding and vetting new members.

Above all, we should seek to positively influence foreign policy efforts to reduce or eliminate foreign governmental support to terrorist groups. With firm evidence that the governments of Libya, North Korea, and Cuba support various

terrorist groups, we can and should make publicly supported diplomatic efforts against such governments. Although we have the capability to do this, there are tremendous administrative and bureaucratic hurdles to surmount in developing such programs.

There is a major role to play in countering global disinformation efforts as used by the former Soviet Union. A thoroughly documented Soviet disinformation campaign attributed the cause of acquired immune deficiency syndrome (AIDS) to the Central Intelligence Agency (CIA) and DOD experiments to develop biological warfare weapons. While this was a total falsehood and seemed preposterous to most Americans, the disinformation was found credible by several audiences elsewhere in the world. We are only at the beginning of the level of fear that this epidemic can cause in our world, but the Soviets and others recognized early on that fear inhibits rational thinking and vastly enhances the effectiveness of their propaganda and disinformation.

The second phase of their AIDS disinformation campaign began surfacing in foreign public news items that accused US military personnel stationed overseas of spreading AIDS in various host nations. News stories and leaflets with this theme appeared in the Philippines, Africa, and the Middle East. The obvious objective was to undermine US military presence and influence on a global basis. Still a foreign policy problem, it could be helped by a comprehensive and coordinated foreign policy that vigorously exposes and describes disinformation campaigns while pointing out extensive US efforts to control the disease.

Many are probably not aware that the Soviet Union engaged in a sinister and very dangerous game of economic warfare against the United States. The area of strategic metals provides a good example. Africa was the most visible battlefield in this subtle economic struggle, having as it does an abundance of these resources easily and economically available. The US is about 10 percent self-sufficient (within our borders) in supplies of this type; the USSR was about 90 percent self-sufficient. Metals such as chromium, cobalt, zirconium, titanium, and tantalum are essential to any modern high-technology industrial society. The military

dimension is obvious from the extent to which defense systems depend on technology.

The Soviets attempted to keep their supplies in the bank—mostly in Siberia, under the ice. They were content to compete with the US on the world market, thus driving up the price. In various countries of Africa, we saw propaganda, disinformation, and guerrilla warfare drive the price up and the Americans out. In Zaire, this combination of activities caused a 600 percent price increase for cobalt in a two-year time period (1979-81). Now, years later, we are still wondering how to gain control of this issue.

Other areas on the economic warfare front were international financing (manipulating debtor nations and credit extensions), protectionism (still an issue), and peaceful uses of nuclear energy. Propaganda in these areas is increasingly more subtle and less noticed, but it should be monitored. Resulting evaluations should be placed in our national security and foreign policy development processes. And we must ensure that the military dimension is properly coordinated.

There is a military dimension in negotiations on the law of the sea—treaties involving fishing rights, oil drilling, navigation rights, and seabed mining. We also have legitimate national security interests in extradition treaties for terrorists and drug traffickers.

Persuasive communications in peacetime may be accurately likened to advertising and public relations programs. Secrets to success involve getting the facts out in clear and understandable ways, relating these facts to perceived human needs, and ensuring enough repetition so that the message is received and reinforced. Various target audiences have differing perceived needs, scripts, and priorities; therefore, the same message must be packaged in different ways in order to appeal to a wider spectrum.

The United States government has a wide variety of communication channels. Each major government agency has offices whose purpose is to announce its policies and explain how its activities support national policies and goals. The United States Information Agency is specifically charged with informing peoples in foreign nations about US policies and describing American culture and our democratic way of life.

This is done through speakers and seminars, press conferences, and various publications. Radio and television programming, such as the "Voice of America" and the new "Worldnet," are able to reach vast audiences.

Areas where there is the most room for improvement are in (1) coordinating various government agencies and (2) packaging the message to fit the audience. Often in crisis situations or periods of tension, the need for rapid response inhibits coordination among various branches of the government. Officials tend to couch their statements in terms they are comfortable with and to speak from their personal points of view, neglecting to consider the cultural aspects and aspirations of foreign audiences. Improvement in these areas is absolutely essential for more effective communications.

Repetition is also necessary. Government officials are busy people; they tend to make policy statements once, and then get on to the next item of business. But policy statements don't necessarily have a life of their own. Unless repeated in various ways and related anew to emerging situations, they tend to submerge in piles of records and gather dust in archives.

The Soviets clearly demonstrated that the most blatant lies can be successfully put across through massive repetition of disinformation and propaganda. In fact, repetition was the secret of their success. Some Soviet propaganda lines were constantly repeated for 50 years; although there was not a single economic success story arising out of a communist or socialist system, belief in this big lie continued over much of the world. People are still willing to give up their freedom for a dream that is inconsistent with the human condition. This is the threat we face from the competition.

Initial changes by Mikhail S. Gorbachev to the Soviet global propaganda machine reflected a stepped-up effort to supplant US power and influence. After the Twenty-seventh Party Congress in the spring of 1986, their propaganda apparatus was restructured and even more centralized. The International Information Department was disestablished and its responsibilities were consolidated within the International Department (ID) and the Propaganda Department (PD). The PD had been responsible for internal domestic propaganda. After

the changes, it had oversight for several activities oriented toward foreign audiences; for example, Tass and Novosti as well as Radio Moscow. This move reflected the theory that foreign propaganda and domestic propaganda are intimately linked, and that greater efficiency can be gained through centralization.

At the same time, Gorbachev's reforms (under his program of glasnost) were being widely touted in the West. Many were led to believe that this change represented a welcome softening of formerly hard Soviet propaganda lines. In fact, one of the major propaganda efforts to sugarcoat this program sought to convince people that the term glasnost meant "openness." A more accurate translation would be "publicity." Proper translation is not simply a semantic game; it shaped the debate on effective policy response toward the USSR.

Most analysts feel that the real intent of glasnost was not to create an open society, but to consolidate Gorbachev's power by modernizing the system and ending economic stagnation. Carefully staged events, such as the Moscow Peace Forum, dissident releases, rock concerts, and television shows, sought to take advantage of easily co-opted Western participants in order to improve external opinion of the Soviet Union, further Soviet propaganda lines, and secure badly needed Western technology.

Those events should have been viewed with extreme distrust, inasmuch as they represented a quantum leap in Soviet propaganda sophistication. We saw significant improvements beginning under Yuri V. Andropov's administration, with expanded use of professional psychology and psychiatry along with infusions of equipment and talent that increased the quality of Soviet PSYOP. Under glasnost, we watched a merger between these professional propagandists and the innocent Western media. It was and is a dangerous and threatening evolution.

Still, the Soviets lost control of glasnost, affording an opportunity to project democratic messages to various Soviet audiences while those channels were open.

If US government agencies can improve their coordination and persuasive communications capabilities, we may be able to slow and then reverse our losing trend in exerting world

influence. Propaganda and disinformation that seek to cause people to trade freedom for lies is a most insidious and dangerous threat, and freedom is far too precious a thing to be defended by haphazard efforts. We do have one significant advantage: There is no need to lie because properly packaged truth is the very best propaganda.

No More Tactical Information Detachments

US Military Psychological Operations in Transition

Col Alfred H. Paddock, Jr., USA, Retired

US military PSYOP today faces an uncertain future. This paper provides a brief perspective on the evolution of US military PSYOP during the twentieth century, examines the conditions that led to a revitalization of these capabilities during the 1980s, contrasts this revitalization with the international and domestic environment faced by the Department of Defense (DOD) today, and outlines some of the major challenges for the US military PSYOP community during a transitional period.¹

A broad definition of psychological operations details the planned use of communications to influence human attitudes and behavior. They consist of political, military, and ideological actions conducted on target groups to create desired behavior, emotions, and attitudes. If used properly, PSYOP will precede, accompany, and follow all applications of force. The military should carry out this course of action under the broader umbrella of national policy. In addition, it should coordinate fully and carefully the military component of the overall PSYOP effort with other agencies of government.

More specifically, PSYOP can demoralize, disorient, and confuse hostile groups. Against such groups, psychological operations are employed as offensive weapons to enhance the overall effectiveness of military operations. They also can unite, inform, and bolster the morale of nonhostile groups. When targeting neutral or friendly groups, they are used to support military objectives by developing cooperative attitudes and behavior in the targeted group.

Evolution of US Military Psychological Operations

The level of interest in military psychological operations during this century has been episodic, basically rising and falling during and after the major conflicts in which US forces have been committed. Over this period, most of the activity in military PSYOP centered on the Army. The following brief historical perspective, therefore, focuses on the Army's experience to illustrate the fortunes of military PSYOP.

While giving psychological warfare (psywar) only token recognition' in World War I, the Army established both the Psychological Warfare Subsection of G-2 in the War Department and the Propaganda Section of G-2 in General Headquarters, American Expeditionary Forces. Military tactical psychological warfare centered on the production of leaflets; radios did not exist as a means of communication, and loudspeakers were primitive. Military propaganda concentrated on producing surrender appeals; balloons and airplanes were the primary method for their dissemination.

From 1918 to 1941, no psychological warfare office existed in the War Department. The lessons of experience were lost, and by 1941 only one officer on the War Department staff had had psychological warfare service in the previous war.

During World War II, most of the Army's operational work in psywar took place at the theater level, where the responsible organization was normally designated a psychological warfare branch (PWB). The largest of these organizations at the theater level, the PWB at Allied Forces Headquarters (PWB/AFHQ), was activated in North Africa in November 1942 at the order of Gen Dwight D. Eisenhower. It was expanded in February 1944 to the Psychological Warfare Division, Supreme Headquarters, Allied Expeditionary Force (PWD/SHAEF). Psychological warfare was defined as "the dissemination of propaganda designed to undermine the enemy's will to resist, demoralize his forces and sustain the morale of our supporters."²

The basic Army field operating unit for psywar was the Mobile Radio Broadcasting (MRB) Company. The equipment for this company was unlike anything conventional soldiers had seen in the field: public address systems, radios,

monitoring sets, loudspeakers, typewriters, mobile printing presses, and leaflet bombs. MRB units were usually divided by the separate Army groups and field armies into small teams, often to work in direct support of frontline conventional combat units. Five such units eventually served under PWD/SHAFF. Although these units resulted from improvisation in 1943 and 1944, the doctrinal and organizational concepts they embodied reappeared in the psychological warfare units formed during the Korean conflict.

During 1945-46, Army psychological warfare staffs and units dissipated with the general demobilization of the military establishment. Despite the efforts of a few senior civilian and military officials to retain a military PSYOP capability, the Tactical Information Detachment was the only operational psychological warfare troop unit in the US Army when the North Koreans attacked South Korea in June 1950. Organized at Fort Riley, Kansas, in 1947, this detachment had been reorganized as the 1st Loudspeaker and Leaflet (L&L) Company. Sent to Korea in the fall of 1950, it served as the Eighth Army's tactical propaganda unit throughout the conflict. Tactical propaganda, sometimes called combat propaganda, was directed at a specific audience in the forward battle areas and used in support of localized operations. Mobile loudspeakers mounted on vehicles and aircraft became a primary means of conducting tactical propaganda in Korea.

To conduct full-scale strategic operations, the 1st Radio Broadcasting and Leaflet (RB&L) Group was organized at Fort Riley and shipped to Korea in July 1951. The 1st RB&L Group was specifically designed to conduct strategic propaganda in direct support of military operations. This propaganda was intended to further long-term strategic aims and was directed at enemy forces, populations, and enemy-occupied areas. The 1st RB&L Group had the equipment and capability to produce newspapers and leaflets, and to augment or replace other means of broadcasting radio propaganda. The group supervised a radio station network, known as the "Voice of the United Nations," and often produced more than 200 million leaflets a week that were disseminated by aircraft or by specially designed artillery shells. The leaflets expressed various themes. Some leaflets, for example, offered inducements for

enemy soldiers to surrender; others bolstered the morale of Korean civilians by proclaiming UN support.

Although the RB&L Group was a concept accelerated to meet the requirements of the Korean conflict, it performed functions similar to those used in psychological warfare in World War II. Its MRB Company bore a direct linkage to the mobile radio broadcasting companies formed under PWD/SHAEF to conduct operations in North Africa and the European theater during 1944-45. However, the MRB companies were organized during World War II to perform tactical psywar; radio later became an essentially strategic weapon that had no place in a purely tactical psychological unit. The strategic concept embodied in the RB&L Group was destined to figure prominently in the psywar capability that was subsequently formed as part of the Psychological Warfare Center in 1952. The tactical idea expressed by the L&L Company also influenced the capability that was developed there. As originally established at Fort Bragg, North Carolina, the Psychological Warfare Center consisted of a psychological warfare school, the 6th Radio and Broadcasting Group, a psychological warfare board, and the 10th Special Forces Group. The mission of this unprecedented center:

To conduct individual training and supervise unit training in Psychological Warfare and Special Forces Operations; to develop and test Psychological Warfare and Special Forces doctrine, procedures, tactics, and techniques; to test and evaluate equipment employed in Psychological Warfare and Special Forces Operations.³

After an initial burst of activity fueled by the Korean conflict and by fears of a possible outbreak of war in Europe, interest in the Psychological Warfare Center began to dissipate. Its title was changed to the Special Warfare Center in 1956, but the Army's psychological operations capability had eroded by the early 1960s.

Consequently, an insufficient base of PSYOP-trained officers were available when the 6th Psychological Operations Battalion was activated in Vietnam in 1965. By 1967, the Army's PSYOP forces in Vietnam had been expanded to a group (the 4th) with four battalions, one in each of the four corps tactical zones (CTZ). The group served under the commander, US Military Assistance Command, Vietnam, with the J-3's Psychological Operations Division exercising direct

staff supervision. The Joint US Public Affairs Office (JUSPAO) provided US PSYOP policy guidance not only to the civilian agencies but also to all military PSYOP elements.

In addition to providing tactical support to field force commanders, the 4th Psychological Operations Group assisted the South Vietnamese government in its communication effort down to the hamlet level. The group headquarters operated a 50,000-watt radio station and high-speed heavy printing presses, published a magazine for Vietnamese employees working for US government and civilian agencies, and could research and develop propaganda materials.

In contrast, PSYOP battalions had light printing presses, a research and propaganda development capability, personnel to work with the US Air Force Special Operations units for aerial leaflet and loudspeaker missions, and ground loudspeaker and audiovisual teams. Loudspeaker and audiovisual teams operated with US divisions and brigades or with province advisory teams. The 7th Psychological Operations Group in Okinawa provided valuable backup support in printing and in disseminating leaflets at high altitudes.

During the height of US involvement in Southeast Asia, the Army stationed PSYOP units at Fort Bragg and in Germany, Panama, and Okinawa. These units were established in addition to the 4th Psychological Operations Group in the Republic of Vietnam. By the mid-1970s, however, all that remained in the active component was an inadequately staffed and antiquatedly equipped group at Fort Bragg-a condition that did not improve significantly for 10 years.

Revitalization of PSYOP in the 1980s

The 1980s saw an upturn in the fortunes of military PSYOP, made possible by several conditions. President Ronald Reagan, who assumed office with a strong anticommunist orientation, characterized the Soviet Union as the "evil empire" early in his tenure. He directed that a program be developed to support noncommunist insurgencies (the "Reagan Doctrine") around the world. With public opinion supporting him, President Reagan embarked upon a large buildup of the US defense establishment-a buildup that benefited military PSYOP.

The president then outlined, in a number of national security directives, his approach to the psychological dimension of national power. His initial national security strategy, announced in the summer of 1981, contained four basic components: diplomatic, economic, military, and informational. This emphasis on the psychological component was retained in subsequent Reagan national security strategies.

In January 1983⁸ President Reagan signed National Security Decision 77, "Management of Public Diplomacy Relative to National Security." This directive defined public diplomacy rather broadly, stating that it "is comprised of those actions of the U.S. Government designed to generate support for our national security objectives." The term generally evolved to embrace a broad range of informational and cultural activities. The decision also established an interagency mechanism to plan and coordinate public affairs, information, political, and broadcasting activities of the US government.

In early 1984, the president directed DOD to rebuild its military PSYOP capabilities. In response to this directive, Secretary of Defense Caspar Weinberger launched a major evaluation of the department's capabilities and needs in psychological operations. This evaluation concluded that DOD's PSYOP capabilities had been allowed to atrophy over the previous decade. Across-the-board deficiencies had developed in policy guidance, roles and missions, doctrine, organization, force structure, operational concepts, planning, programming, training, logistics, intelligence support, readiness, personnel programs, and-most importantly-attitude, underscoring the need for education and heightened awareness at all levels of military and civilian organizations.

DOD PSYOP Master Plan of 1985

Secretary Weinberger elected to use a DOD PSYOP master plan as the framework for rebuilding military PSYOP capabilities. Approved in mid-1985, the plan served as a comprehensive design for the fundamental improvement of the department's capabilities to effectively perform worldwide psychological operations in support of national objectives in peace and crisis and at all levels of conflict.

The plan specified a number of remedial actions-over 200, in fact-to be implemented over several years. Several essential themes manifested themselves.

The first theme highlighted the need to develop a comprehensive joint doctrine for the formulation, direction, coordination, and conduct of PSYOP in peace, crisis, and war. In effect, this doctrine provided a foundation for the revitalization effort. Among other things, it sought to enunciate the function of PSYOP as a force multiplier in all military activity, establish the conceptual framework for planning and implementation, and delineate roles and responsibilities of the several components. The Joint Chiefs of Staff (JCS) published this doctrine in 1987. It was later revised to reflect US experience with PSYOP in support of military operations in Panama and the Persian Gulf.

The development of doctrine was to be paralleled by major improvements in PSYOP planning, the second theme of the 1985 Master Plan. It devoted insufficient human talent to full-time, meaningful, sustained PSYOP planning at appropriate staff levels. The report card on this major deficiency offers mixed reviews, but some evidence of progress exists. Creation of a small psychological operations directorate, the first such office to exist in the Office of the Secretary of Defense (OSD) in over 20 years, indicated the seriousness with which Secretary Weinberger undertook the revitalization effort. The PSYOP staff element in the Office of the Joint Chiefs of Staff (OJCS) was upgraded from a branch to a division. It also showed an increase in personnel, but later reverted to a branch and lost a few personnel spaces. The Department of the Army staff created a psychological operations and civil affairs division, where before only one full-time officer had been assigned to this activity.

Outside the Pentagon, a few changes occurred. Among the unified commands, United States Southern Command (USSOUTHCOM) created a PSYOP detachment to augment its staff capability. The US Special Operations Command (USSOCOM) was established in 1987 at MacDill Air Force Base, Florida. Included in this unified command staff was a directorate for psychological operations and civil affairs (J-9). More recently, in 1990, the Army created the Civil Affairs and Psychological Operations Command at Fort Bragg. Commanded by a USAR

brigadier general and staffed primarily by reserve component personnel on varying periods of active duty, this headquarters of 146 personnel (later reduced to 80) serves all active and reserve component Army civil affairs and psychological operations units. This new organization reports to the US Army Special Operations Command (USASOC) at Fort Bragg.

Much more remains to be done in this area, however. Perhaps the key requirement is that staff officers receive formal training in this specialized area and that psychological operations become an integral part of the operational course of action in any plan. A few innovative and resourceful staff officers can make a vast difference if they have access to a command's major planning activities. Because of the paucity of trained PSYOP staff officers in major commands, the burden for planning too often falls upon the Army's 4th Psychological Operations Group, the only active duty unit of its type among the services.

Development of adequate numbers of PSYOP planners is where the Air Force, Navy, and Marine Corps can make an important contribution to the revitalization envisaged in the 1985 Master Plan. The conduct of psychological operations is not the exclusive domain of such specialized units as those in the Army. In the current resource-constrained environment, only a small possibility exists that the other services will opt to field new PSYOP units. On the other hand, there is every reason to expect those services to develop fully qualified PSYOP planners to meet their own needs and to provide their proportionate share on joint staffs.

To help address this need and in response to the 1985 Master Plan, the Army's John F. Kennedy Special Warfare Center and School at Fort Bragg developed a joint PSYOP staff planning course in 1988. A large proportion of its students have been from the Army's reserve component PSYOP community. Too few representatives from the other services have participated, and it is uncertain how many of them actually were assigned to staff positions where their expertise could be utilized. Reportedly, the Army plans to eliminate the course in 1996. If it does, this will be unfortunate-it is the only formal joint PSYOP planning course currently available. What is needed instead is a renewed and continuous emphasis that would enable the course to fulfill its original purpose. This

will not happen, however, until the services begin to send more officers to the course and ensure their assignment to positions where their training can be utilized.

Closely related was the need to educate our officer corps on psychological operations, the third theme. As indicated earlier, the 1985 Master Plan stated that the root cause of the atrophy of our military PSYOP capabilities was a lack of understanding of psychological operations, their value, and their application. Some improvement was made in this critical area as a result of frequent briefings to senior commanders and staff officers by PSYOP personnel, the professionalism of PSYOP units in contingency planning and in support of conventional forces on joint training exercises, and the steady improvement of PSYOP studies and assessments in support of the unified commands and national level agencies. Certainly, the credible performance of PSYOP forces during combat operations in Panama and the Persian Gulf also played a key role in this regard.

Additionally, the PSYOP courses being presented by both the Air Force and the Army help to address the deficiencies in this area of PSYOP awareness and understanding. The Air Force's Joint Senior Psychological Operations Course, held four times a year by their Special Operations School at Hurlburt Field, Florida, provides selected senior officers and civilians with an awareness of how psychological operations can support national objectives throughout the spectrum of conflict. This course initially showed considerable promise as an educational tool, but it attracts too many personnel whose duties have little relationship with psychological operations. Again, this situation requires renewed and continuous emphasis to interested senior officials in key positions. Unfortunately, these personnel too often find it difficult to fit a three-or four-day course away from the office into their busy schedules. A shorter orientation-perhaps four hours, presented by a traveling team-should be considered as an addition to the present course.

As was the case before the Vietnam War, the 1985 Master Plan stated that PSYOP instruction in our mainstream service school system-where our future commanders and staff officers are trained-was limited or nonexistent. This situation not only made more difficult the PSYOP community's job of educating supported units on this unique weapons system-it

also had a negative effect when priorities concerning force modernization were being set.

To address this loss of PSYOP institutional memory, the under secretary of defense for policy, Dr Fred Ikle, sent letters in 1986 and 1987 emphasizing the secretary of defense's intention to revitalize our military PSYOP capabilities and offering an OSD presentation on psychological operations to commandants of the colleges and the command and staff colleges. The intent was to stimulate interest in a more extensive treatment of PSYOP in service school curricula. The military services were asked to review all levels of their professional military education (PME) curricula, both officer and enlisted, and to develop new educational goals that would upgrade their psychological operations PME. As a second part of this approach, OSD initiated a contract to develop applicable PSYOP curriculum materials for the services.

These materials were in fact provided to the services, but there is little evidence to suggest that the services integrated PSYOP into the curricula of their schools. Nor have great speakers made presentations on PSYOP to service schools in a coherent and consistent manner (some presentations are made in electives). Institutionalization of PSYOP understanding will not occur until service schools have removed this deficiency.

The fourth broad theme in the 1985 Master Plan encompassed the need to modernize our PSYOP force structure in terms of both personnel and equipment. With the exception of an increase of the 4th Psychological Operations Group's strength, the force structure today is essentially the same as in 1985. The Navy has an excellent radio and television capability in its reserves and a 10-kilowatt (kW) mobile radio transmitter that is assigned to its Tactical Deception Group (Atlantic), both of which can be used to support PSYOP activities. The Air Force has a National Guard squadron of specially fitted C-130 aircraft for radio and television support of PSYOP along with other duties. Also, a handful of Air Force officers with PSYOP expertise are serving in key positions in the Pentagon, among the unified commands, and at their Special Operations School at Hurlburt Field. The Marine Corps has two civil affairs groups with PSYOP as a secondary

mission in its reserves. Only the Army has active duty forces dedicated solely to psychological operations.

The 4th Psychological Operations Group at Fort Bragg is all that remains of the Army's active PSYOP capability. Assigned to the US Army Civil Affairs and Psychological Operations Command, and to a part of the US Army Special Operations Command, the 4th Group has many worldwide missions and responsibilities. The 4th provides support to all levels of DOD, from unified command through division. It supports both conventional forces and special operations forces. In addition, it is often nailed upon to provide support to national level agencies and organizations. If any one military unit can be adjudged a "national asset," surely the 4th Psychological Operations Group fits the requirements.

Essentially, a military PSYOP unit engages in two broad activities: (1) research/ analysis and (2) operations. The first activity consists of continually monitoring and assessing psychological environments in specific foreign nations to determine how those situations affect the formulation and execution of US policies and actions. This research and analysis results in published studies and assessments that are unique; they provide the foundation for establishing psychological objectives that support US goals related to foreign nations or groups. Research and analysis is therefore essential to accomplishment of the second broad activity: planning and executing PSYOP campaigns that employ communications media and other techniques designed to cause selected foreign groups and individuals to support US national and military objectives.

In peacetime, a military PSYOP unit conducts research and analysis of specific geographic regions and target audiences, develops PSYOP plans to support conventional and special operations units, and participates in field exercises that employ these plans. Because of the paucity of PSYOP expertise at unified commands, the 4th Psychological Operations Group provides staff assistance and advice to headquarters and to other major commands.

It should be eminently clear from the foregoing that one active duty PSYOP organization cannot support all unified command requirements for mid- or high-level intensity

conflicts. The reserves are, therefore, a vital component of the "PSYOP community," since 73 percent of the Army's PSYOP mobilization capability lies in its reserve component units. Serving as the Army's planning agent to align the AC and RC units program (CAPSTONE, which links reserve units with the units they would support upon mobilization), the Civil Affairs and Psychological Operations Command (USACAPOC) provides training assistance to, and coordinates the contingency planning efforts of, reserve units. The 4th Group assists USACAPOC in this effort.

Generally speaking, then, USACAPOC and the 4th Psychological Operations Group act as a "strategic nucleus" for the PSYOP community; they provide the bulk of peacetime and low-intensity conflict requirements, give direction and guidance to the PSYOP community for contingency planning and participation in peacetime exercises, and serve as the command and control nucleus for generally or partially mobilizing reserve component forces. The reserve component performs its planning and training responsibilities under the CAPSTONE program and prepares for general or partial mobilization in support of the unified commands.

Paradoxically, the successful CAPSTONE program underscores one of the PSYOP community's most glaring weaknesses: its limited capability to respond to peacetime and low-intensity conflict requirements. While mid- and high-intensity conflict requires either partial or general mobilization of the reserve component, the active component must provide most PSYOP activities during peacetime and at the lower end of the conflict spectrum.

As a result of initiatives undertaken in the early_ 1980s, the Army increased the strength of the 4th Group by 500 personnel, roughly doubling its size by the mid- to late 1980s. The 1985 DOD PSYOP Master Plan provided additional impetus for this increase. The reserve component PSYOP structure has remained relatively stable in recent years, with a little over 3,000 personnel.

In terms of personnel quality, the Army's military occupational specialty (MOS) for PSYOP enlisted personnel was a welcome accomplishment. Reports of the high quality of personnel being trained under this specialty have been encouraging.

Less encouraging was the Army's decision in the mid-1980s to remove its **officer PSYOP** and civil affairs MOS from the foreign area officer (FAO) specialty. The change was disturbing because it separated psychological operations from the specialty that had provided its intellectual lifeblood. The core of the area expertise (knowledge of foreign cultures) and the analytic capability of psychological operations fell within the FAO specialty.

The Army's initial decision included both PSYOP and civil affairs in the special operations functional area. Subsequently, however, the Army developed separate functional areas for PSYOP (FA 3913) and civil affairs (FA 39C). It remains to be seen whether this decision will provide the quality officers that previously had been produced by the FAO program.

With respect to the modernization of psychological operations equipment, the progress has been more positive. Several Army initiatives in the early and mid-1980s upgraded active and reserve component print, radio, loudspeaker, and audiovisual capabilities. The 4th Group's media production center, built in the mid-1980s, represented a quantum leap in the military's PSYOP capability to operate in a modern audiovisual environment. Similarly, the Air Force allocated funds to modernize its National Guard aircraft dedicated to support PSYOP.

Nevertheless, modernization of PSYOP-unique equipment requires continued emphasis. For example, with one exception, the old, relatively immobile 50,000 kW radios (the TRT-22s) in the PSYOP community have not been replaced. PSYOP loudspeakers once again need upgrading, and the Air Force needs a device that can rapidly release leaflets in high-altitude operations.

Two of the most controversial themes of the 1985 DOD PSYOP Master Plan were the organizational separation of psychological operations from special operations and its corollary, creation of a joint psychological operations center. Indeed, these were the only truly revolutionary initiatives in the original plan-and both failed.

The authors of the 1985 Master Plan believed that, in general, the subordination of psychological operations to special operations detracted from recognition of the overall applicability of PSYOP in times of peace, crisis, and war. The

1985 Master Plan, therefore, called for separating psychological operations from special operations throughout DOD, including departmental levels and all headquarters and staffs of the JCS, the services, the unified and specified commands, and the component and subordinate commands. The plan outlined several reasons for separating PSYOP from special operations.

Planning, particularly in the unified and specified commands, suffered because the sole PSYOP planner was usually located in the special operations staff element and was employed only part-time in psychological operations. This subordination detracted from the broader responsibility of planning psychological operations support for the theater's total requirements, particularly in those missions that link military psychological operations and national objectives, policy, and strategy, and that require in-theater interagency cooperation.

Further, the subordination of psychological operations units to the special operations field, including its command and control structure, contributed to the lack of understanding of PSYOP, its uses and capabilities, by military officers and senior civilians. This association and subordination caused many in the field to conclude that psychological operations were focused primarily in support of special operations missions.

While PSYOP does have a mission in support of special operations, it also has a much broader application in peacetime and in crisis-with or without accompanying military operations-and across the entire spectrum of conflict. In the 1980s, only 10 percent of the Army's psychological operations forces-active and reserve-were designated by contingency plans to support special operations units in wartime.

Similarly, the argument for separation of PSYOP from special operations was implicit in the Army's and JCS's arrangements for wartime command and control of psychological operations. In wartime, most of the PSYOP forces are aligned (within the unified commands) with a chain of command that is totally separate from that of special operations forces. PSYOP units are combat support forces and are employed at both strategic and tactical levels from the theater to the division as a matter of routine; special operations forces are employed primarily as strategic assets only on an exceptional basis.

Because of its controversial nature, the separation directed by the 1985 Master Plan was slow in implementation. To be sure, some important initial steps were taken. A new OSD psychological operations directorate established in January 1986 was assigned to the principal deputy under secretary of defense for policy and was separated from special operations in terms of overall policy responsibilities. On the joint staff, PSYOP was removed from the Joint Special Operations Agency and placed under the J-3. An important precedent was established on the Department of the Army staff when a separate PSYOP and civil affairs division was created; and two unified commands—USSOUTHCOM and USCENTCOM—effected the separation (PSYOP from special operations) within their staffs.

But for the large part, separation did not take place among the unified commands, subordinate service headquarters, or at the operational level. The Army, for example, took the position that separation applied only to staff levels, not forces. A major reason for the delay, of course, was the uncertainty resulting from the congressionally mandated reorganization of special operations forces. This subject will be discussed later in more detail. Suffice it to say at this point that full separation did not occur.

The separation issue was closely related to the final major theme of the original master plan: creation of a joint psychological operations center. According to the master plan, psychological operations was sufficiently important to warrant the creation of a separate center dedicated to the long-term development and nurturing of this unique capability. This center eventually became the organizational and intellectual font of PSYOP within the Department of Defense.

The responsibilities for the center envisaged in the 1985 Master Plan included long-range strategic psychological operations plans; continuing education and training of personnel research and analytical studies; and development of equipment. The center was also to assist OJCS and OSD to develop, plan, and coordinate the defense portion of inter-agency activities, and to assist the unified and specified commands in their planning of psychological operations. To best accomplish these tasks, the plan favored the Washington, D.C. area for the center's location.

The joint psychological operations center was to consist of two separate but mutually supporting elements, one operational and the other developmental, each indispensable to the other. These elements were to have been the 4th Psychological Operations Group along with PSYOP spaces in the Army's John F. Kennedy Special Warfare Center and School. This concept would have used existing PSYOP units and personnel spaces to provide the nucleus of initial manpower requirements.

The plan indicated that initially the center probably would be under Army management because the other services had few personnel to contribute. However, as representation from the other services increased to more than token level, the joint character of the center was to be emphasized by making its command rotational among the services. As with the separation theme, however, the joint psychological operations center envisaged by the original plan met with fierce resistance, particularly from the Army-which, of course, would have been the most heavily affected by the initiative.

Implementation of both initiatives-the separation of PSYOP from special operations and the creation of a joint psychological operations center-became, in effect, hostage to the resolution of several issues that resulted from the congressionally mandated reorganization of special operations forces. In October 1986, Congress passed a special operations force (SOF) reform package sponsored by Senators William Cohen (R.-Maine) and Sam Nunn (D.-Ga.). The law created a unified SOF command under a four-star general or flag officer, an assistant secretary of defense for special operations and low-intensity conflict, and a board for low-intensity conflict within the National Security Council (NSC). It recommended the appointment of a deputy assistant to the president for low-intensity conflict. Particularly important, it directed the secretary of defense to create a major force program category for DOD's five-year defense plan for special operations forces.

After passage of this legislation, a major question arose on whether to include PSYOP and civil affairs units in the assignment of forces to the new USSOCOM. Good arguments were presented on both sides of this issue. Two of the major advantages advanced for inclusion were that these forces would benefit from the sponsorship of a unified commander

and participation in the major force program for SOF. But the secretary of defense's previous guidance to separate PSYOP from special operations-as part of his decision concerning implementation of the 1985 DOD Psychological Operations Master Plan-had to be considered. After a lengthy review of this issue, Secretary Weinberger decided to assign Army and Air Force active and reserve component psychological operations and civil affairs units to USSOCOM, effective 15 October 1987.

Secretary Weinberger's decision, of course, sealed the fate of the two most controversial and far-reaching initiatives of the original plan: separation of PSYOP from special operations and creation of a joint PSYOP center. Separation at the operational level had never taken place, since the Army's PSYOP forces remained under their special operations command at Fort Bragg. And separation at the staff level-which had seen some initial progress, at least in the Pentagon-would inevitably fail as well. On the joint staff, PSYOP was transferred back to special operations. And in May 1992, overall policy responsibility for PSYOP in OSD was moved to the Office of the Assistant Secretary of Defense (OASD) for Special Operations and Low-Intensity Conflict.

The secretary's decision also made moot the creation of a joint PSYOP center, as originally conceived in the 1985 Master Plan. The forces and personnel spaces scheduled for the nucleus of this project remained under the Army's special operations command and as part of USSOCOM. Even the creation of a much smaller version of the joint PSYOP center-located in the Washington, D.C. area and concentrating primarily on strategic PSYOP-has become unlikely in the current environment.

A candid assessment of the 1985 plan, therefore, provides mixed reviews. The most significant initiatives on increasing the strength of the 4th Psychological Operations Group-establishing an enlisted PSYOP MOS, modernizing PSYOP-unique equipment for both active and reserve component units, and undertaking detailed PSYOP contingency planning in support of the unified commands-were all undertaken by the Army in the early 1980s, prior to the 1985 plan. To be sure, the plan provided additional emphasis to help bring these initiatives to fruition, but the initial impetus came from

the Army. Improvements undoubtedly occurred in the formulation of joint doctrine, indoctrination of the officer corps, and staff planning, but these areas still require attention. And the two truly revolutionary themes of the original master plan—separation of PSYOP from special operations and creation of a joint PSYOP center—did not become a reality. In the final analysis, perhaps the greatest benefit to the PSYOP community was the morale-enhancing evidence of senior-level interest, due in large part to the dedication of the late Gen Richard G. Stilwell, USA, Retired, who spearheaded the 1985 plan while serving as the deputy under secretary of defense for policy.

Nevertheless, while the plan's ambitious goals were not fully realized, the revitalization efforts of the 1980s made possible the highly credible performance of PSYOP forces in Panama (Operations *Just Cause* and *Promote Liberty*) and the Persian Gulf (Operations *Desert Shield* and *Desert Storm*). The early integration of PSYOP into military planning for these operations—heretofore all too often a serious deficiency—contributed significantly to its successful utilization. In both contingencies, PSYOP forces employed a wide range of media, including loudspeaker broadcasts, radio transmissions, posters, and leaflets. Principal PSYOP objectives were to (1) cause the enemy to cease resistance and surrender, (2) solicit information and the turn-in of weapons, (3) inform civilians and keep them out of the battle areas, (4) establish a favorable image of friendly forces, (5) deflect hostile propaganda, and (6) support civil affairs units in emergency relief and consolidation activities. Overall, the goal was to enhance combat operations and reduce casualties on both sides. Successful accomplishment of this goal would have been doubtful without the increased personnel strength of the 4th Psychological Operations Group and the modernization of equipment for both active and reserve component PSYOP units brought about by revitalization.⁴

Thus, the revitalization of military PSYOP capabilities that took place during the 1980s was fueled by a presidentially inspired public perception of the common threat (i.e., the Soviet Union), a "defense consensus" which enabled massive increases in military budgets, several key Reagan administration national security directives that provided impetus for DOD, and the "top-down" emphasis of Secretary Weinberger

and a few key advisors which resulted in the 1985 DOD PSYOP Master Plan.

The Changing International and Domestic Environment

A comparison of these earlier conditions with the present environment provides some rather stark contrasts. The most dramatic change has occurred in the American public's perception of the threat.

An important stimulus for this change in attitude was the emergence of Mikhail Gorbachev as Soviet leader in 1985. His domestic political and economic reforms, the withdrawal of troops from Afghanistan, the cessation of "Voice of America" jamming, his announced intention to reduce Soviet military forces by 500,000 men and cut their budget by 14.2 percent, and the intermediate nuclear forces arms control agreement were just some of the actions that helped to lessen international tensions. Polling data of US public attitudes depicted a startling change in just over a two-year period; by July 1988, 94 percent of voters believed that US-USSR relations were stable or getting better. Mr Gorbachev's policies led Margaret Thatcher to conclude in November 1988 that the cold war had come to an end.

If onlookers thought Thatcher's conclusion a bit premature, they should consider that the subsequent years have been truly mind-boggling. The dissolution of the Warsaw Pact and the liberation of Eastern Europe, the reunification of Germany and its emergence as a major power, and the disintegration of the former Soviet Union have been revolutionary geopolitical changes that few could have foreseen. Russian Republic President Boris Yeltsin's signing of a historic strategic arms control agreement with President George Bush in June 1992 is only the most recent indicator that the cold war as we knew it has, in fact, ended.

During the same period that these momentous events have occurred in the international arena, Americans have become more preoccupied with domestic concerns. A lingering economic recession and high jobless rate, concerns over the burgeoning federal budget deficit, and deep-rooted problems of

the cities (as vividly seen in the Los Angeles riots) have taken their toll. In February 1992, the conference board's measure of consumer confidence registered its lowest level in 17 years; and in April, four-fifths of Americans surveyed said they believed the country was seriously on the wrong track.⁵ These domestic anxieties, coupled with the absence of a clearly discernible external threat, have led to growing pressures for steeper cuts in the defense budget and in foreign aid. The "defense consensus" of public and congressional support during the early Reagan administration has disappeared.

Thus, the context within which defense planning takes place is in transition, as William Hyland, editor of *Foreign Affairs*, reminds us:

This time the cliché is true: this is a new era, but we are only in the opening phases. It is fruitless to search for a politically correct concept of the national interest to justify American foreign policy. Debating in these categories is itself an intellectual hangover from the Cold War. . . . The US defense posture is only in the preliminary stages of the restructuring that will follow the end of the Soviet threat.⁶

Challenges for Future US Military Psychological Operations

The challenges for military psychological operations are formidable. To be sure, inclusion of PSYOP forces in USSOCOM provides some assistance in meeting these challenges: a four-star proponent (the commander, USSOCOM) and, ostensibly, full participation in the major force program (MFP-11) for SOF. The clout of an assistant secretary of defense (ASD/SOLIC) also should benefit psychological operations at the policy level.

Nevertheless, three broad areas must be addressed if the PSYOP community is to emerge from this period of transition to play a viable role in our nation's security: (1) education of senior civilian and military officials on the value of the psychological dimension; (2) planning for the use of military PSYOP in a changing world; and (3) continued modernization of the PSYOP force structure.

Planning should begin now to ensure that the psychological dimension receives appropriate attention by the new administration-and OASD/SOLIC should play a leading role.

Unfortunately, a loss of momentum has occurred in this area. The national security strategy statements of President Bush (March 1990 and August 1991) placed a much less explicit emphasis on the informational element of national power than did those of Ronald Reagan. The Reagan administration directives that created interagency public diplomacy mechanisms, and that played a vital role in revitalizing DOD's psychological operations, have lain dormant. The NSC has paid little attention to this area.

A review of our national security strategy suggests that OSD, OJCS, and USSOCOM must continue to coordinate their efforts to have psychological operations considered by the NSC. DOY must intensify its efforts to educate new players on the NSC staff and to build allies among the key agencies in order to resuscitate existing national security directives-or create new ones-that provide guidance to psychological operations and public diplomacy activities. To address a long-standing deficiency, DOD sorely needs a senior-level NSC mechanism to integrate and direct the information and psychological operations activities of the various agencies. Such a forum also would provide a vehicle to overcome the differences in operational terminology that have plagued past efforts to integrate interagency planning in these areas.

To meet its needs in a changing world, DOD should undertake once again to update its bilateral agreements with the United States Information Agency (USIA), the Board for International Broadcasting, and the Central Intelligence Agency (CIA). With diminishing budgets almost a certainty, it will behoove these agencies to pool their resources and accomplish common goals in the psychological dimension.

Another major task facing PSYOP advocates after every election is that of educating the new players in DOD. This process should begin after a major turnover of senior civilian officials has taken place. A good vehicle to accomplish this is the DOD PSYOP Master Plan. Inclusion of key advisors in the final staffing of the document would provide an opportunity for them to educate themselves on psychological operations. There is some symbolic value attached to having the secretary of defense sign the master plan: It provides visible evidence of top-down emphasis.

Similarly, a number of DOD directives affecting military psychological operations need to be modified and revalidated. Involving key civilian players in this process would provide an excellent opportunity to educate them about PSYOP. The same holds true for staffing the defense planning guidance and the national military strategy, both of which should follow publication of the president's national security strategy. Indeed, the current national military strategy, published in January 1992, contains no mention of the psychological dimension.

Renewed efforts must be made to indoctrinate the mainstream of the officer corps on psychological operations. High-level emphasis, continuously applied, will be necessary to remedy the long-standing absence of PSYOP instruction in most of PME. Until this is done, OSD, JCS, and USSOCOM should coordinate their efforts and provide annual presentations to the senior service schools and the command and staff colleges. Formation of a traveling team to provide instruction on PSYOP to major commands should be considered. Examples of the successful use of psychological operations in Grenada, Panama, and the Persian Gulf would enhance the learning experience for commanders and staff officers. PSYOP should be integrated into computer-assisted war games and simulations. High-quality articles on psychological operations in professional military journals would help to publicize the successful use of this valuable force-multiplier. Institutionalization of military PSYOP will take root only when commanders are convinced that it is indispensable to combat effectiveness.

This education process must continue with planning for the utilization of military psychological operations. This will be a critical task during a period in which there is no apparent clear consensus about either US national security interests or the military's post-cold-war missions. Consider these words of Paul Hammond:

Where strategy used to be something that we could think of as a plan to be executed, now it must be increasingly a set of capabilities for dealing with contingencies. Where strategy once was a matter of inventing the future, now it is increasingly a matter of adapting to it. ⁷

This, of course, is what our present National Security Strategy and National Military Strategy attempt to provide: a broad focus, regionally oriented, and a "base force" to deal with an uncertain and rapidly changing world.

Within this context, military PSYOP advocates must demonstrate the applicability of psychological operations in all environments: support of conventional forces, low-intensity conflict, and special operations forces. Similarly, military PSYOP can play a valuable supporting role in the peacetime activities of the CINCs and other government agencies, such as the USIA and CIA.

First priority, however, must go to planning military PSYOP that will assist the unified commands-the combatant commands-and the conventional forces assigned to support them for various contingencies. As the military services reduce in size and units are withdrawn from Europe, a major realignment of Army PSYOP forces to other unified commands will take place. The CAPSTONE program provides an excellent vehicle to link these forces to the combatant commands for planning and participation in exercises. As the unified commands identify their priorities for contingency planning-a process of "emerging missions" that is likely to go on for some time-the PSYOP community must be alert to offer their services early on. In many cases, existing regional analytical studies will require revision, or the development of new ones, to provide the foundation for detailed PSYOP planning. Finally, supporting PSYOP plans should anticipate the new contingency plans of the unified commands and their assigned forces.

In addition to planning for mid- or high-intensity conflicts, the PSYOP community must plan for, and be prepared to participate in, peacetime and low-intensity conflict requirements. These requirements may include humanitarian assistance, peacekeeping, disaster relief, counterdrug operations, civic action, unscheduled studies and assessments oriented to crisis areas, advisory mobile training teams for the military forces of friendly nations, staff assistance to unified commands, counterterrorism, foreign internal defense, and support for DOD and non-DOD agencies. PSYOP forces-indeed, all special operations forces-provide versatile capabilities for

the National Command Authority to consider in the uncertain future environment.\$

Closely related is this major challenge: to continue modernization of the PSYOP force structure in terms of both personnel and equipment. For the PSYOP community, the corollary to Army Chief of Staff Gordon Sullivan's oft-quoted "no more Task Force Smiths" is "no more Tactical Information Detachments" (the only operational psychological warfare troop unit in the US Army when the Korean War erupted in June 1950; it consisted of two officers and approximately 20 enlisted men). In the face of continued pressures to reduce even more the size of the military, strenuous efforts must be made to avoid the fate experienced by the PSYOP community after every major conflict in this century. As recently as the early 1980s, the 4th Psychological Operations Group consistently reported the lowest readiness ratings in both personnel and equipment-and many reserve component units lacked items vital to mission accomplishment, including loudspeakers. This oversight must not recur.

In particular, the modest-but crucial-gains in personnel strength by the 4th Group during the revitalization of the 1980s must be preserved; the bulk of requirements for support of peacetime activities and low-intensity conflict will necessarily fall upon the active component. Over the long term, the key to military PSYOP viability will be the health of the Army's functional area for psychological operations (FA 39B). Continued high-level emphasis is needed to attract quality officers for this specialty, to provide them with excellent training, and to offer sufficient field grade billets for their utilization and career advancement.

The modernization of PSYOP-unique equipment undertaken in the 1980s, while beneficial, still has not been completed. The replacement for the TRT-22 radio, in particular, needs to be fielded. New loudspeakers are needed. Modernization, however, should be an ongoing process; emphasis needs to be placed on developing more mobile equipment for the future.

Being assigned to USSOCOM should help the PSYOP community in its perennial battle to obtain a proportionate share of dwindling resources or, put another way, to ensure that they do not suffer a disproportionate share of reductions.

However, a speedy resolution of whether or not military PSYOP will fully participate in MFP-11 for special operations forces is needed.

At the same time, the PSYOP community must demonstrate a fiscally responsible attitude by making maximum use of existing resources. This usage includes not only continued reliance on the reserve component for mobilization in mid-and high-intensity conflicts, but also in investigating ways in which specially trained reservists can be used to augment active component units for peacetime and low-intensity conflict requirements. Establishment of redundant capabilities should be avoided. For example, in the absence of a joint PSYOP center in the Washington, D.C., area, the 4th Psychological Operations Group's regional analysts should provide maximum support to the JCS and OSD PSYOP offices in neither of which have area experts been assigned. The use of new technologies to enhance military psychological operations capabilities without increasing personnel requirements also must be pursued. Overall, the keys will be cost-effectiveness and the utility of military PSYOP in both peace and war.

Summary

US interest in military psychological operations during this century has been episodic, basically rising and falling during and after major conflicts. The Reagan administration interrupted this pattern by providing the impetus for a revitalization of US military PSYOP during peacetime. The international and domestic conditions that made this possible have changed significantly, however, and the PSYOP community faces formidable challenges in maintaining a viable capability for an uncertain future. To address these challenges, emphasis must be placed on educating senior civilian and military officials concerning the value of psychological operations, on aggressive planning to support the emerging contingency and peacetime missions of PSYOP within the unified commands, and on continued modernization of the PSYOP force structure.

After having prevailed in the battle to gain control of military psychological operations forces and policy, the commander in chief, USSOCOM, and the assistant secretary of defense for

special operations and low-intensity conflict must play key roles in facing these challenges. For their part, the PSYOP community must demonstrate fiscal responsibility, maximum utilization of existing resources, and continued professionalism in accomplishing new missions. Working together, the goal of both the PSYOP community and its special operations leadership should be to ensure "no more Tactical Information Detachments" during this period of transition.

Blending Military and Civilian PSYOP Paradigms

Col Benjamin F. Findley, Jr., USAFR

This article compares and contrasts the concepts, philosophies, processes, strategies, and major elements of the civilian business marketing system (BMS) with the military PSYOP system. The purpose is to inform the reader of the many similarities and successful applications of proven BMS approaches, both macro and micro, and how they relate to strategic and tactical objectives in PSYOP scenarios. The goal is to improve the reader's understanding that integrating the effective practices of civilian marketing systems into the military PSYOP sector is very important. A related goal is to offer recommendations.

In a business firm, marketing generates revenues by persuading specific customers to do something. Whenever you try to persuade somebody to donate to the United Way, refrain from littering the highways, save energy, vote for your candidate, or buy your service, you are engaging in marketing. The challenge that faces the BMS is to generate those revenues and results by satisfying a targeted customer and making a profit in a socially responsible manner. Since every aspect of our lives is affected by business marketing practices, often in ways we do not even consider, we need to understand the basic principles and concepts of effective marketing. Then we need to apply them to PSYOP.

Business Marketing Philosophy

The American Marketing Association defines marketing as "the process of planning and executing the conception, pricing, promotion, and distribution of ideas, goods, and services to create exchanges that satisfy individual needs and

organizational objectives." Inherent in this definition is an exchange process where two or more parties give something of value to one another to satisfy felt needs. The marketing function, simple and direct in subsistence-level economies, is more complicated in industrial societies. Nevertheless, the basic concept of exchange is the same. To understand the BMS philosophy, we must distinguish between a sales orientation and a marketing orientation. A sales orientation assumes that customers will resist purchasing products and services not deemed essential and that the task of selling is to convince them to buy something even if they do not need it. It is a "push"; effort, focusing on selling after the product exists.

A marketing orientation is different-it begins with the customer and integrates marketing into each function of a business. Marketing will initially establish what the customer wants and needs; it should play a lead role in planning, coordinating, and directing the organization's activities. It certainly does involve selling, but only after the customer's need has been established. If the marketing job has been done well, the customer doesn't need much persuading.

Military Psychological Operations Philosophy

Military PSYOP is a specialized field of persuasive communications. It involves formulation, conceptualization, implementation, and evaluation of government-to-government and government-to-people persuasion. It is a planned use of human actions to influence the attitudes of populations that are important to national objectives. Lt Col Philip Katz, USA, Retired, emphasizes that the critical variable in military PSYOP is that of influencing the perceptions, and thereby the will, of foreign populations. PSYOP can modify the opinions, emotions, attitudes, and behaviors of a target audience. It can be directed at enemy forces to demoralize, disorient, and confuse them. It can induce defection, encourage dissident elements, and reduce combat effectiveness by adversely affecting the enemy's discipline and command and control functions. Directed toward neutral or friendly target audiences, it can be

used to unite them, boost their morale, and provide information designed to foster their understanding and cooperation.

To enhance the total opportunity for success, PSYOP must be integrated into, and considered in, all military decisions. Certainly, PSYOP planning should be concurrent with-and coordinated with-all operational planning. A few commentators imply that there is some nefarious objective and some element of deliberate misinformation involved in PSYOP. Therefore, it is important that the public understand the truth: the United States government does *not* engage in public disinformation activities!

Business Marketing Process

A company's complete marketing system consists of many processes and variables, some controllable and some uncontrollable. *Marketing mix* is the term that describes the combination of the four main controllable inputs that constitute the core of a company's marketing process: (1) the product or service, (2) the promotional activities, (3) the distribution system, and (4) the price structure. Each input has its own process, with key decisions to be made and activities to be accomplished.

The product mix involves policies, procedures, services, and activities related to the product lines to be offered, the markets to sell to, and the degree of product differentiation. The product mix also involves decisions about which product quantities to offer with which brands, in which packages, where, and when.

The promotion mix process begins with an analysis of the organization's overall mission, from which specific promotion objectives are determined. The promotion process consists of decisions and activities related to advertising, personal selling, publicity, and sales promotion. Activities include analyzing the promotion's target audience; selecting appropriate themes and symbols, following market segmentation strategies; deciding on the optimal blend of print, broadcast, and other media; setting sales quotas; conducting message pretests; and analyzing selected characteristics of the target market. Motivation, perception, attitudes, opinions, and stress are

considered. The promotion mix directly relates to the military PSYOP process and will be addressed later.

The distribution mix involves decisions about transportation, storage, and inventory. It also includes decisions about the type, quantity, and quality of wholesalers and retailers required.

The price mix includes methods for setting the right base price for a product. Discounts, allowances, markups, break-even points, and pricing strategy are elements of the price mix.

Aside from these four controllable elements in the marketing mix, the manager must be concerned with uncontrollable forces in the environment. Marketing is affected by cultural factors, laws, economic conditions, competition, technology, and demography, none of which are controllable; neither are the firm's microenvironment of suppliers, marketing intermediaries, and customers.

Military Psychological Operations Process

Psychological operations can be divided into three general categories: strategic, operational, and tactical. Strategic psychological operations are conducted to advance broad or long-term objectives designed to create a favorable global environment for military operations. Operational PSYOP seeks to achieve midterm objectives in support of regional campaigns and major theater operations. Tactical psychological operations are conducted to achieve short-term objectives against an enemy force, in direct support of tactical units. According to Field Manual 33-1, Psychological Operations, the mission of PSYOP forces is to support conventional as well as special operations forces at all levels of war and within all degrees of the conflict spectrum—low intensity, midintensity, and high intensity. Overlapping missions and objectives can blur the distinction between the categories of PSYOP.

Propaganda development for PSYOP involves a multistep process that is very similar to the promotion mix process for the BMS. Initially, the unit's mission must be analyzed so the military PSYOP mission can be derived. Information must be collected and the target must be analyzed. Just as in the business promotion process, the vulnerabilities and susceptibilities

of the target audience are key factors. Appropriate themes, symbols, and media are selected, and propaganda messages are developed and pretested. Campaign approvals are acquired, propaganda is disseminated, and the impact of the psychological objective is assessed according to specific indicators.

Just as there are strategic, operational, and tactical levels of military PSYOP, there are corresponding levels in marketing planning. Louis E. Boone and David L. Kurtz define strategic marketing planning as "the process of determining the primary (long-term) objectives of an organization and the adoption of courses of action and the allocation of resources necessary to achieve those objectives." Tactical planning in marketing focuses on the implementation of short-term plans that must be completed near-term to implement overall strategies. Boone and Kurtz emphasize the necessity of adequate resource allocation in tactical planning. Certainly, this necessity should be recognized by military PSYOP planners.

Cultural Differences

The marketing manager in business and the military PSYOP specialist must understand a variety of influences on the promotion and persuasion processes in trying to satisfy the needs and wants of the target audience. Culture is at once the most basic and the broadest environmental determinant of individual behavior. Culture is comprised of values, ideas, attitudes, and other symbols that shape human behavior. The influence of culture is difficult to define because so many crucial elements are hidden from the participants of the system itself. Cultural patterns often exist as unrecognized assumptions that are taken for granted. Culture affects how and why people live and behave as they do, which affects the target audience's susceptibility to promotional themes and their buying/ accepting behavior. America has many ethnic, religious, racial, and economic groups, each of which has its own cultural values. And each of these groups has sub-cultures with norms and values that are used to define meanings and to specify needs and wants. Thus, individuals respond uniquely to persuasive messages and appeals.

Persuasive messages in military PSYOP and in business marketing must use symbols and themes that are easily recognizable and meaningful to the culture they are trying to reach. A key persuasion guideline is that one should not substitute one's own judgment and cultural values for the values and cultural characteristics of the audience being targeted. No market has been more frustrating and difficult for American business marketers than the Japanese market. Japanese culture has produced marketing institutions and promotional relationships that differ from those found in the United States.

While leading some university students on an industrial tour of Japan in 1981, for example, I found that the food distribution system there was different from that in the United States. Japanese wholesalers, unlike their US counterparts, are specialized sellers. They do not carry a complete line of products for a select group of stores. Instead, they carry a select line of noncompetitive products that they supply to all supermarkets. Japanese wholesalers take great pride in supplying all retail stores with an exclusive but narrow product line. The goal of American wholesalers is total distribution of a complete product line to a captive set of stores; the goal of the Japanese wholesaler is distribution of a limited set of products to all retail outlets. Culture is a major influence on marketing and PSYOP.

Social Influences

The social groups to which people belong or aspire -to belong help explain why they buy certain types and brands of products, shop in one type of store and not another, accept and believe certain ideas and persuasive messages, and spend their money in certain ways. A person's social class is a major influence on his style of life and an important factor in determining his social and economic behavior. A social class is a group of people whose members are nearly alike in terms of a characteristic that is valued in their group and that clearly differentiates them from others.

PSYOP specialists and promotion managers must be aware of social class influences on the acceptance of ideas and the

willingness to behave a certain way. Different persuasive appeals, different copy, different art, and different media may be needed to promote the same product to different social classes. An upper-middle-class wife may want products, ideas, and brands that are clear symbols of her social status. She may be highly susceptible to preselling through mass media. Conversely, a lower-lower-class wife may buy largely on impulse and may be influenced by point-of-purchase promotion materials. She may not care to read much, and the broadcast media may be of great importance in communicating with her.

When social influences are combined with foreign culture influences, we see how difficult it is to understand needs and behaviors well enough to persuade an individual to accept a PSYOP message. One way to exert influence on a social class in a culture is to identify and target opinion leaders. They are chosen on the basis of expertise as well as social position. Exposure to mass media is significantly greater among opinion leaders than among nonleaders and mass media directly influence opinion leaders. It is important to note that opinion leaders are far more effective in securing opinion changes among followers than are the mass media. Thus, it is important in PSYOP as well as in marketing to identify and aim persuasive messages directly at opinion leaders.

Family Influences

An individual is born into a family and inherits a certain social status. That status remains until he becomes an adult. Of all face-to-face groups, a person's family plays the strongest role in basic value and attitude formation.

Early family training is not cast off easily; it remains to affect one's individual values, ideas, and behaviors. Even as the adult individual strives to acquire the prestige symbols of another class, latent family influences remain to sway acceptance of ideas and products. Most buying decisions and idea acceptances are made within a framework of experience developed within the family.

Needs and Motives

Personal determinants of behavior include needs, wants, motives, and self-concepts. All of these variables combine with the previously presented interpersonal and group factors to influence one's acceptance of an idea or purchase of a product. People have a need when they lack something useful, required, or desired. When a few needs are fairly well satisfied, others emerge. Some say needs are insatiable, incapable of ever being fully satisfied; thus, PSYOP specialists and marketers do not have to satisfy one need before progressing on to other needs. Several needs at several levels can be present concurrently to influence an individual's behavior, but this approach complicates the prediction of behavior. Abraham H. Maslow proposed a hierarchy of needs that includes the most basic: physiological, safety, social, esteem; and the highest: self-actualization. Motives are inner states that direct people toward the goal of satisfying a felt need. Examples of motives include high quality, conformity, low price, performance, ease of use, long life, prestige, friendship, the opposite sex, and a desire to be different.

One's self-concept includes feelings, perceptions, and evaluations of oneself as a person. How one perceives and evaluates one's own status in relation to others in the same social class and reference groups-and to one's own levels of aspiration-are prime forces in shaping one's self-concept. The self-concept is learned; it emerges through experiences with the environment and through interactions with other people. By observing socially acceptable and unacceptable behavior and comparing one's own behavior to them, one lays the basis for one's own self-concept. The self-concept is useful in PSYOP and marketing because, through their actions and purchases of products, individuals let others know who they are and what they hope to be or to do. The purchase of goods and the expression of ideas serve as social symbols that communicate meaning. The behavior of an individual will be directed toward enhancing his self-concept through the consumption of goods and the expression of ideas as symbols, allowing a prediction of events.

Perceptions and Attitudes

Everything a person knows about the world and what it contains comes from perceptions. Perception is the reception of stimuli through the senses and the attachment of meaning to them. Sound, light, odor, taste, and pressure are received by one's sensory receptors-ears, eyes, nose, tongue, and skin. These sensations are translated into perceptions that are altered by previous learning, beliefs, values, and attitudes, and then organized into meaningful concepts. People perceive things that make sense within the context of their beliefs, values, attitudes, and experiences. Since we cannot possibly perceive all stimuli at any given time, our perceptions are highly selective and subjective; we see what we want to see and hear what we want to hear. Further, if we do not like what we perceive, we often distort or modify it.

Mass-marketing messages and PSYOP messages are based on selective perception. Because a large number of persuasive messages are directed at different target audiences, PSYOP specialists and marketers must carefully test the messages to be employed with representative targets. They must make every effort to ensure that the various target groups perceive the messages that were intended.

Attitudes are predispositions to respond in particular ways toward people, ideas, activities, or things. An attitude is not neutral; rather, it is for or against some person, object, or idea. An attitude is composed of three dimensions: cognitive (factual information), affective (feelings and emotions), and behavioral (tendencies to behave in a certain way). Attitudes affect both perception and behavior, and people resist changes- in their attitudes. The more closely an attitude is related to one's self-concept, the greater will be one's resistance to changing it.

To change an attitude, a PSYOP specialist must (1) provide new information to enlarge and change the cognitive dimension; (2) attack the affective dimension of the attitude by associating the end-state of change with the desirable consequences that result; and/or (3) induce the person to engage in "attitude-discrepant" behavior (behavior that contradicts held preferences). Successful attitude-change approaches include using a trustworthy and credible source, drawing

conclusions for the target, repeating the message, and using both one-sided and two-sided messages.

Successful and Unsuccessful Business Marketing

Businesses spend several billions of dollars each year on marketing, a fact that indicates the importance they place on it. According to an *Advertising Age* article, the top 100 firms spent more than \$34 billion in 1989 for advertising. Advertising represents 'about 20 percent of total marketing expenditures. The top 10 advertisers spent more than \$10 billion for advertising alone in 1989. Those companies have been successful. Failures do occur, however. A 1988 *Advertising Age* report, for example, lists these \$100 million failures: Campbell's Red Kettle Soups, Ford's Edsel, DuPont's corfam, Hunt's flavored ketchups, and Gillette's Nine Flags Cologne.

Newspapers account for the largest annual advertising expenditure (\$31.2 million in 1988). Other 1988 expenditures: television (\$26.1), direct mail (\$21.2), radio (\$7.7), and magazines (\$6.1). Use of advertising, however, does not guarantee success even if it is planned and implemented well. A key reason is that most people do not systematically process the information they receive through the marketing message. We are largely emotional, influenced by testimonials and emotional appeals-we do not logically consider pertinent criteria when we purchase products. It seems we are more influenced by the skill, appearance, and character of the presenter than the content of the message. A 1988 *Advertising Age* survey mentioned three of the most powerful ads in US history: Volkswagen's "Lemon," Marlboro's "Country," and Coca-Cola's "Real Thing." Aside from getting commitments from dealers to carry the product, the Coca-Cola ad was successful because it capitalized on the affective domain and the unsystematic emotional responses of people. A critical conclusion for PSYOP specialists and marketers is that the ad created a psychological idea of a unique and better taste. It focused on image and emotional themes through heavy repeat advertising and readily identifiable names, symbols, and packages. It also

linked abstract, beneficial images to the physical product-the implied associations of Coca-Cola with youth and authenticity.

Business Marketing Models

Marketing lessons can be learned from business failures as well as from effective marketing models. Burger Chef did not realize that economic conditions are major factors, did not adapt to changing consumer preferences, and did not meet target market expectations. Coors did not recognize changes in the environment that necessitated adjustments in marketing strategies' and did not take the time to continue developing an image of quality and great desirability. The World Football League lost credibility by taking actions counter to prior promises and by not paying strict attention to environmental variables.

After analyzing five leading models of consumer behavior, I have blended optimal elements from each to suggest a marketing model for the buyer's decision process. The model focuses on systematic thinking and defining relevant elements for making a buying decision. It attempts to explain the progressive process that a consumer might experience in buying products or accepting ideas. PSYOP specialists and marketers can anticipate effective messages if they understand the process through which buyers can progress. They can then address those messages to bring about the desired change in behavior. My buyer decision model is like any scientific problem-solving model except that it focuses on buyer behavior. It consists of five stages: problem recognition, information gathering, alternative evaluation, the decision to buy, and postpurchase evaluation. Initially, the target consumer recognizes a problem because of inadequate supplies, changing needs, or other internal or external activities. This first stage forces buyers to succinctly state the problem based on specific unfilled needs. Then the second stage begins the planned search for specific, relevant, and identical information on all possible products. Buyers must weigh the pros and cons of the various products based on a set of criteria during this third stage. In the next stage, they make the decision that best meets their needs and wants, and that satisfies the

expectations of influencers in their social groups. The fifth and final stage is the evaluation of that decision; it should not be omitted.

Effective Objectives

Specific marketing and promotion-persuasion objectives, based on the organization's general goals, should be established. Clearly stated objectives should exist for each promotion tool so that results can be measured against them. Advertising, personal selling, publicity, and sales promotion functions should have specific expected objectives that are measurable. Print, broadcast, and audiovisual media should also have specific objectives. Marketing objectives should meet certain criteria and should be built on a solid foundation of research that reveals what the targets want to buy. The objectives should be stated in terms of target benefits-and in quantitatively measurable terms. They should help attain and reinforce the firm's overall objectives, and they should be reviewed periodically.

The Ethics of Persuading

Many critics of marketing contend that persuasion is really manipulation-or even control-of consumers, unethically coercing them into buying products they do not want. Is it immoral to arouse fears of inadequacy to sell an antiperspirant? Is it wrong to use reference-group concepts to make a product more appealing? Is it improper to design products and appeals that enhance a buyer's self-concept in order to gain a sale? Some observers argue that embellishment and distortion are legitimate and socially desirable activities and that illegitimacy enters the picture only if there is falsification with larcenous intent.

That argument notwithstanding, however, truth is the best persuasion approach; it should be the fundamental principle in both business marketing and military PSYOP. Truth, which is basic to strategic peacetime foreign policy, should be our fundamental guideline. The ultimate questions concern "What is the truth?" and "Can consumers really be convinced to buy something they do not want?"

Target Market Analysis

Target market analysis is performed every time a marketing or PSYOP campaign is developed. It includes selecting a target, determining conditions that affect the target, analyzing target vulnerabilities, specifying target susceptibilities, formulating the persuasive objective, determining target effectiveness, and assessing campaign impact indicators. Once the conditions and vulnerabilities of the Iraqi soldiers were identified in the Persian Gulf War, individual susceptibilities for each vulnerability were specified. Because the coalition's bombing campaign was effective, the Iraqis had needs for food, shelter, water, medical attention, and basic safety. They were, therefore, driven to respond in an expected way. Target market analysis is key to successful marketing and PSYOP.

Recommendations

My recommendations, which are based on my own analysis, are intended to serve as suggestions for improved business marketing and military psychological operations. They emphasize the transfer of proven marketing and promotion strategies, concepts, and techniques from the civilian business marketing system to the military PSYOP system.

- **A primary recommendation is to accept the marketing orientation (as opposed to a sales orientation). The marketing orientation begins with the customer's needs and wants, then integrates marketing into each function of the business to design the desired product. (The sales orientation focuses on the product characteristics and attempts to sell the existing product.)**

Both PSYOP planning and marketing planning should be concurrent with, and coordinated with, all operational planning. Together, they should address the target audience's needs in any given situation. This relates to the function of PSYOP as a force multiplier in all types of military activity.

- **Another recommendation is to ensure that marketing and PSYOP support all operations, to include production and finance in business or conventional and special operations in the military. This support should be for all levels of business**

operations and all levels of war-strategic, operational, and tactical; low intensity, midintensity, and high intensity.

- **A commensurate resource and budget commitment to support adequate PSYOP and marketing is required so that PSYOP and marketing can be integrated into all operational planning. It is an absolute necessity that military PSYOP and business marketing planners understand the level of resourcing necessary to conduct a successful campaign; undercapitalization may doom an otherwise promising organization to failure.**

- **The business community and the military services must accept culture as the most basic environmental determinant of individual behavior, and they must gather sufficient quantitative and qualitative information about it. Individual judgment and cultural values should not be substituted for those of your target audience.**

- **PSYOP specialists and marketing managers must be aware that social-class membership influences the acceptance of ideas, the willingness to behave a certain way, and the need to use different persuasive techniques and concepts.**

- **Persuasive messages should be aimed directly at opinion leaders; they are far more effective in securing changes among followers than are the mass media.**

- **It is important to make maximum utilization of family influence; research shows that it plays the strongest role in basic value and attitude formation.**

- **The PSYOP specialist and the business marketer must know the various needs of individuals and the corresponding specific persuasive appeals that can be employed to influence each need.**

- **Marketing and PSYOP professionals must recognize the dominant influence of the self-concept-and how consumption of goods and expression of ideas are directly based on that concept and on selective perception. They must understand the main behavioral dimensions of attitudes, so that appropriate techniques can be employed to change them.**

- **My final recommendation is an all-encompassing one. It refers to the need to educate our military and civilian leaders about marketing philosophy and psychological operations (as a unique weapons system). Also, managers and specialists**

already employed in the field need tactical training. The professional military education service school system should include courses designed to improve the awareness and understanding of PSYOP. The primary goal would be to enhance the understanding of strategic PSYOP and marketing, their benefits and long-term capabilities, and their applications in support of our national objectives.

PART II

National Policy
and
PSYOP Planning

Introduction

This section presents articles about recurrent psychological issues and roles in formulating and implementing our national policy, objectives, and strategy. The authors explain historical and contemporary elements of the national policy process in **PSYOP** and the framework within which national **PSYOP** policy is formulated, administered, and implemented.

Dr Carnes Lord explores the historical influences on developing effective US strategy, doctrine, and organizational structure for the conduct of psychological and political warfare. While accepting that a psychological-political component is inherent in every use of the diplomatic, economic, and military instruments of national power, he urges a rethinking of the role of political and psychological factors and a revitalization and integration of their capabilities into US national strategy. Dr Lord analyzes the influences of American cultural inhibitions and the media on psychological conflict.

Michael A. Morris reminds us that national policy objectives must be clearly defined so that military objectives and strategy can be precise. He emphasizes that clarification of political objectives is the responsibility of political leaders rather than military leaders. Morris concludes that propaganda advantages can be gained through clearly stated political objectives. He suggests guidelines for distinguishing clear political objectives from vague ones.

William F. Johnston focuses attention on psychological operations as a vital instrument in national liberation wars. He believes governments of countries threatened with insurgency should regard **PSYOP**, particularly face-to-face communications, as a first line of internal defense-the Vietnam lesson. He also wants more recognition of **PSYOP** as a major instrument of low-intensity conflict and the elevation of **PSYOP** planners to "first-team" status.

Lloyd A. Free examines the role of public opinion and the psychological dimension in international security affairs. He believes that while public opinion cannot be slavishly followed, psychological data should be collected and analyzed so that government can take this factor into account in planning.

Lt Col Philip K. Katz, USA, Retired, Ronald D. McLaurin, and Preston S. Abbott include a critical analysis of US PSYOP. They focus on the communications aspect of international relations and PSYOP, identify and assess the principles and critical developments in this field, and advance ideas for progress. They stress that intelligence is the most commonly overlooked prerequisite to effective PSYOP. Their focus on evaluating the effectiveness of PSYOP challenges the reader to systematically concentrate on results. This article is clearly a historical piece that sets the groundwork for producing effective PSYOP.

The Psychological Dimension in National Strategy

Dr Carves Lord

To recall the time when psychological-political warfare was widely, acknowledged by Americans as an important instrument of national strategy requires a certain effort of historical imagination. Such was indeed the case, however, from the early days of the Second World War until the mid-1960s. The experience of World War II convinced many American political and military leaders that the psychological dimension of conflict had become critical in the contemporary world.

Totalitarian regimes that employed modern communications technologies to specialize in ideology and subversion constituted a qualitatively new strategic problem for the West. The postwar years witnessed an outpouring of academic studies in this area, most of which took for granted the necessity and legitimacy of a vigorous American response to the emerging political-ideological threat posed by the Soviet Union and the international communist movement.'

The US government allowed its propaganda, and political warfare capabilities to wither in the years of rapid demobilization immediately following World War II. Creation of the Central Intelligence Agency (CIA) in 1947, however, provided a fresh impetus and an organizational vehicle for covert psychological operations and political action in peacetime. The deteriorating political situation in Western Europe in the late 1940s created urgent objectives for the CIA's covert action directorate.

The coming of the Korean War stimulated improvements in US overt capabilities as well. In 1950, President Harry S Truman created the Psychological Strategy Board in the White House to provide a high-level focus for government-wide

activities in this area. The new International Information Administration was established within the State Department; military psychological operations were given new life (the Army established the Psychological Warfare Center at Fort Bragg, North Carolina, in 1952); and the Psychological Operations Coordinating Committee attempted to provide operational coordination among the various involved agencies.² President Dwight D. Eisenhower moved to create the US Information Agency (USIA) as an autonomous agency reporting directly to the National Security Council.³

It can be questioned whether the US government as a whole was able, in the 1950s, to develop an effective doctrine and organizational structure for the conduct of psychological and political warfare. Sharp differences of opinion existed over fundamental questions of strategy toward the Soviet bloc and over the roles of key agencies such as CIA and USIA-and coordination among the agencies left much to be desired.⁴

It could perhaps be argued that militarization of the Vietnam War was the key factor underlying the progressive atrophy of US political warfare capabilities after the mid-1960s. However, it seems evident that larger issues of governmental organization and national style or culture also figured critically in this development. It should have been clear that the assignment of political warfare responsibilities to new agencies would not eliminate-and in certain respects would probably fortify-the sources of bureaucratic resistance to this new instrument of national power.⁵ Finally, mention must be made of the cultural revolution that took place in the United States beginning in the mid-1960s. The shattering of the foreign policy consensus of the postwar decades (a result of Vietnam) meant, in the first place, a questioning of American values and the legitimacy of a leading world role for the United States. Such attitudes could only spell trouble for any strategy that depended on the confident projection abroad of America's political identity and values.

Any attempt to rethink the role of political and psychological warfare in US strategy today must take account of these fundamental and persisting obstacles. Before turning to consider them more systematically, however, it is necessary to sketch briefly the basic features of political and psychological

warfare and their relationships to other instruments of national power.

One problem is the general tendency to use the terms psychological warfare and political warfare interchangeably, not to mention a variety of similar *terms-ideological* warfare, the war of ideas, political communication, psychological operations, and more. The uncertainty of reference derives partly from the fact that this sort of warfare is waged to a considerable extent with weapons that are not truly distinctive. There are indeed distinctive psychological instruments-radio broadcasting, publications of various kinds, and educational and cultural prpgrams-that are capable of communicating information and ideas. But because these capabilities are easier to conceptualize, and to handle bureaucratically, the tendency has been to give them undue weight when it comes to defining the overall phenomenon.

There is a psychological dimension to the employment of every instrument of national power, emphatically including military force at every level. Similarly, major increments of military and economic power necessarily generate political effects. In thinking about psychological and political warfare, the tendency has been to think about the conflict of ideas, ideologies, and opinions. Yet the concept is in fact seriously misleading. Psychological-political warfare is also about cultural and political symbols, perceptions and emotions, behavior of individuals and groups under stress, and cohesion of organizations and alliances.

Using the term warfare to describe US psychological-political strategy in its broadest sense is itself problematic. Psychological-political operations need not be directed only to adversaries; neutral, allied, and semiallied nations potentially constitute highly important targets because our enemies will target them in efforts to break those alliances.

The English language apparently does not include a good term for designating psychological-political operations in their broadest sense. In recent years, and especially since the arrival of the Reagan administration, the term public diplomacy has gained considerable currency in Washington. Public diplomacy appears to encompass three distinct though closely related functions: international information, international political

action (or what may be called overt political warfare), and public affairs. The inclusion of public affairs is a recognition that it is impossible in a modern democracy to separate sharply information communicated to domestic audiences from that communicated to international audiences, but the domestic function associated with public diplomacy differs from traditional public affairs by virtue of its strategic approach and its active effort to shape the domestic political agenda.⁶

The public diplomacy rubric serves a useful purpose, but it is not and was not intended to be comprehensive. Covert political warfare was excluded from its purview from the beginning. Nor does it have any clear relationship to military psychological operations, to educational and cultural affairs, or to the range of US government activities that may be grouped under the general label of international aid and humanitarian affairs.

I would propose, if only for the sake of clarity, the following anatomy of basic psychological-political warfare functions.

Political warfare is a general category of activities encompassing political action, coercive diplomacy, and covert political warfare. In general, the first of these functions is performed by diplomatic personnel, the second by military and diplomatic personnel, and the third by intelligence personnel. Political action refers to a range of activities, including certain kinds of multilateral diplomacy, support for foreign political parties or forces, and support for or work with international associations of various kinds.? Coercive diplomacy refers to diplomacy presupposing the use or threatened use of military force to achieve political objectives.\$ Covert political warfare corresponds roughly to the covert aspects of what the Soviets called active measures; it includes support for insurgencies, operations against enemy alliances, influence operations, and black propaganda.⁹

Psychological operations, once frequently used in a general sense to designate psychological-political operations as a whole, is probably best reserved for use as a term of art to designate military PSYOP.I° Military PSYOP can encompass both overt and covert activities in both peacetime and war, and its scope can vary from the tactical battlefield to the operational

and strategic levels of conflict. Historically, however, US military interest in PSYOP has focused heavily on tactical applications in wartime. Battlefield PSYOP is sometimes distinguished from consolidation PSYOP, which is geared to securing the loyalty and cooperation of civilian populations in combat areas and is closely related to civic action conducted by military forces in low-intensity conflict situations. Another related function is troop information or education, which serves among other things-much like public affairs in relation to public diplomacy-to counter the psychological operations of the enemy.

International communications encompasses international information and international educational and cultural affairs. **USIA performs this range of functions, though other organizations-in particular, "Radio Free Europe/Radio Liberty" but also the Departments of State and Defense-perform information functions of political or strategic importance as well.** ¹¹

A further general category is *international aid and humanitarian affairs*. This category includes foreign economic and development aid, food aid, humanitarian assistance (rescue operations, disaster relief, famine relief, etc.), and technical assistance of various kinds. Many agencies involved in such activities, including the Defense Department, the Agency for International Development, and the Peace Corps, are organizations that have dedicated missions in this area. Although these functions are bureaucratically scattered and very largely autonomous, they have a very important psychological-political component. Whether intentionally or otherwise, they serve as significant instruments of US foreign policy and national strategy.

Finally, to repeat what was said earlier, a psychological-political component is inherent in every use of the diplomatic, economic, and military instruments of national power. The art of negotiation rests on an understanding of individual and group psychology and a sensitivity to cultural contexts. Similarly, the exercise of military command at all levels involves an assessment of the psychological strengths and vulnerabilities of the enemy commander and his forces; deception and surprise are key elements of the military art. A

nation's economic and military strength creates political weight that can be exploited in a variety of ways to advance the national interest.

The impetus for rethinking the role of political and psychological factors in US national strategy has come primarily from the renewed attention given these matters by the Reagan administration.¹² Since 1981, a major effort has been under way to modernize and expand US government capabilities in the area of international communications, particularly radio and television broadcasting.

It remains doubtful that the administration has succeeded in overcoming the obstacles, both internal and external, to a thorough revitalization of US psychological-political capabilities and their full integration into national strategy.¹³ In many respects, the cultural pressures working against such an effort are as strong as-or stronger than-ever. In addition to a kind of generic resistance to such activities on the part of Americans as Americans, there has been a wholesale loss of understanding and support of them among American elites in recent years. But perhaps equally troublesome is the resistance stemming from the national security bureaucracy itself and from the continuing weakness of integrated strategic planning and decision making at the national level.

Painful as it may be to face squarely the question of American cultural inhibitions in the area of psychological-political conflict, the effort is necessary-in order not only to develop intelligent approaches for dealing with them but also to achieve cultural self-consciousness, which is essential for effective participation in this kind of conflict. It is essential because Americans tend to assume that people everywhere are much like themselves, with similar fundamental motivations and views of the world. But blindness to differences in national characteristics is apt to be a fatal handicap for anyone attempting to affect the psychological orientation and political behavior of foreign audiences.

Perhaps the most severe single limitation in the American outlook is its tendency to discount the relevance of nonmaterial factors such as history, culture,, and ideas. Americans tend to assume that concrete interests such as economic well-being, personal freedom, and security of life and

limb are the critical determinants of political behavior everywhere. It is an interesting irony that such a view is so prevalent in a country as fundamentally idealistic as the United States while the importance the Soviets attributed to ideological factors stands in some tension with the materialistic basis of Marxism.

Connected with this emphasis on material considerations is the fact that Americans, unlike many peoples, are uncomfortable with personal confrontation and argument and do not customarily debate political and ideological questions in their private lives. Americans tend to look on the political realm as an arena not of conflict and struggle but of bargaining and consensus, where strongly held opinions and principled positions are disruptive of the process and to be discouraged. This tendency makes it extremely difficult for Americans to deal effectively in international settings where basic American values are under challenge. Furthermore, American notions of fair play and due process are subject to serious misinterpretation abroad. Americans' insistence on a presentation of both sides of any argument is frequently seen as reflecting a lack of self-confidence. In general, the openness and penchant for self-criticism in American society strike many foreigners as manifestations of weakness rather than strength.

Manifest or latent in the attitudes of many Americans toward the practice of psychological-political warfare is a distaste for any sort of psychological manipulation or deception. The idea that psychological-political warfare is a black art that can be morally justified only under the most extreme circumstances is a derivative of such attitudes. That such activities necessarily involve misrepresentation or deception is in any case far from the truth. (The conveying of purely factual information under certain circumstances can have powerful psychological effects.)

Military psychological operations, such as battlefield broadcasting, have as their primary purpose the saving of lives-enemy as well as friendly lives. Indeed, such activities make both moral and strategic sense. According to the Chinese strategist Sun Tzu, "what is of supreme importance in war is to attack the enemy's strategy. . . . Next best is to disrupt his alliances.... The next best is to attack his army....

The worst policy is to attack cities." As Sun Tzu puts it, "To subdue the enemy without fighting is the acme of skill." In other words, competence in the psychological-political sphere is the essence of a rational approach to war.¹⁴ Failure to attain such competence within the limits of one's possibilities is a failure that is all too likely to be paid for in blood.

As important as the effect of these general cultural biases is the role of the American media. Developments in the culture and operating style of the prestige media in the United States in recent years have substantially complicated any effort by the US government to engage seriously in psychological-political conflict. Before the late 1960s, it may be argued, a satisfactory understanding existed between journalists on the one hand and American military and government officials on the other regarding the proper scope and limits of press coverage of national security and foreign policy matters. In particular, the press in wartime tended to adopt the national cause and to accept broad responsibility not only for protecting sensitive information but also for safeguarding the morale both of the troops at the front and of civilians at home

Since Vietnam, there has been a dramatic change.¹⁵ In the general wreck of the national foreign policy consensus resulting from that experience, the media have adopted an increasingly skeptical attitude-not only toward the specific policies and actions of the incumbent administration but also toward many of the fundamental assumptions that had underpinned the global position and role of the United States since World War II. The legitimacy of the American defense and intelligence establishments in particular has been sharply questioned and subjected to scrutiny by the new style of investigative journalism inaugurated by the prestige press. Most significantly, the media ended their deference to and informal cooperation with an incumbent administration in favor of a posture of neutral observer or critic. One result of this shift has been a general refusal to take responsibility for the consequences of media coverage's effect on national security policy outcomes.¹⁶

This change in media attitudes is worth dwelling on, since the role of the media on the battlefield of the future is likely to decide whether the United States will be capable of conducting

effective military psychological operations. In general, the media now acknowledge a responsibility to avoid jeopardizing the lives of American soldiers engaged in military operations. But they do not recognize an obligation to refrain from publicizing information that demoralizes American troops, reveals aspects of American intelligence or military planning, undermines American diplomatic initiatives, or gives psychological aid and comfort to the enemy. This obligation is denied even though the ultimate effect of such disclosure may be to prolong military operations and cost American lives, not to speak of more generally damaging the international position of the United States and its ability to avoid future conflicts. Nor do the media recognize any obligations with respect to the domestic audience.

Of particular importance in this connection is the wartime role of television. To argue (as media spokesmen regularly do) that television coverage is essential to informed debate on the merits of a particular military action is unconvincing, not to say disingenuous. The information content of TV pictures is typically low or nonexistent, and the emotions such pictures arouse are more likely to defeat than to promote rational discussion. The rapid juxtaposition of death and destruction images torn out of any intelligible context, so common in television coverage of war, inevitably encourages the feeling that the war is futile, immoral, or absurd.¹⁷

Equally harmful is the practice-pursued well beyond the point of abuse by the networks in Lebanon in 1983-of interviewing American GIs on their feelings and views about the situation they happen to be involved in. To portray soldiers (and if they are looked for they will be found) who are confused, inarticulate, naive, or bitter about the reasons why a war is being fought or the way it is being conducted serves no purpose. The immediate danger to morale and the effect on allied and enemy perceptions are only part of the costs of such behavior. As in the case of media obsession with the families of terrorist victims, the effect is to pander to private concerns and emotions and to mobilize them in a way that greatly complicates the pursuit of rational policies by the US government.

All of this suggests that serious thought needs to be given to restricting or even eliminating at least television's presence on

the battlefield of the future, with or without the cooperation of the media. Particularly difficult, of course, is the question of censorship or restraint of the media during limited contingencies or undeclared wars such as Vietnam, Lebanon, or Grenada. Because the stakes in such conflicts are relatively low, the pressures for preserving peacetime rules of media engagement are difficult to resist. Yet it is precisely these conflicts in which the political and psychological element in war is predominant. These conflicts are therefore most directly susceptible to influence by media reporting. Devising acceptable arrangements for limiting media coverage of such wars in the future may well be critical if the United States is ever to engage in them successfully.¹⁸

The American media have also affected the US government's international information programs. Despite the popular image of the "Voice of America" and "Radio Free Europe/Radio Liberty" as propaganda organs fully comparable to "Radio Moscow," they have been profoundly affected by the American media's evolution over the last two decades, as well as by the general cultural climate these media have reflected. Objectivity and balance as understood by the new journalism have become the standards for these radios as well. The point here is not that a balanced treatment of American or Soviet virtues and vices is not in some sense desirable, but rather that the domestic cultural context shapes to an unhealthy degree the aims and methods of the US international radios.

The effective conduct of psychological-political warfare by the United States is perhaps more immediately constrained by bureaucratic and organizational weaknesses within the US government itself. There is a connection between the inadequacy of US psychological-political warfare efforts in the past and the inadequacy of strategic planning and decision making at the national level. Precisely because the instruments of psychological-political conflict are not altogether distinctive, this arena requires fully integrated planning and coordinated operations throughout virtually the entire national security bureaucracy.

We need not dwell at length on the causes of the resistance to psychological-political warfare throughout the US diplomatic, military, and intelligence establishments; they are apparent to

most of those who have had direct experience in this field. The State Department continues to ply its trade very much in the spirit of the foreign ministries of nineteenth-century Europe, with only grudging accommodation to the role played by modern communications, public opinion, ideology, and political theater in contemporary international affairs.¹⁹ The military services-in their preoccupation with technology, major weapon systems, and the big war-tend to neglect low-cost approaches to enhancing operational effectiveness, especially at the lower end of the conflict spectrum; and they tend to regard psychological-political warfare as someone else's business.²⁰

The failure of both the State Department and the military to assume psychological-political responsibilities might seem to point to the intelligence community as the natural home for such activities. Yet the CIA has generally been unwilling or unable to allow the degree of coordination with other governmental entities that is essential for an integrated national strategy in this area. There is also a feeling at the agency that the era of CIA involvement in political or ideological struggles is essentially past-that an aggressive agency role can only jeopardize more important institutional equities.

What, then, would be involved in a revitalization of US psychological-political warfare capabilities? The foregoing discussion is not meant to suggest that fundamental change is a hopeless proposition-only that it is essential for us to be conscious of the obstacles to it. We must be particularly conscious of the less tangible obstacles that cannot be fixed by organizational rewiring or other short-term measures. At the same time, useful steps undoubtedly can be taken without creating a revolution in the way Americans behave or the US government conducts its business.

Perhaps the most promising area for change is in the field of military psychological operations. The fact that military psychological operations have generally been treated as a subspecialty of special operations is a good indication of the conceptual and operational limitations under which it has long labored.²¹ Of course, the very identification of PSYOP as a special forces mission has tended to isolate it from normal military activities and bring it under a certain suspicion,

which its black connotations have further strengthened. But PSYOP has perhaps suffered most from identification with the hardware and missions of the tactical battlefield—that is, leaflet delivery, loudspeakers, and radio broadcasting. As a result of all this, PSYOP has had very low priority in terms of personnel, equipment, training, exercising, and doctrine. In addition, it has suffered from low visibility at senior command levels within the military (particularly outside the Army, which owns most PSYOP assets), not to speak of other US government organizations.

This situation is now beginning to change as a result of renewed interest within the military as well as at the national level. The rethinking of PSYOP roles and missions is still at an early stage, however, and basic doctrinal and organizational questions remain to be worked out. The Air Force and Navy appear not yet fully persuaded that PSYOP can be a responsibility of all the services and of all higher command echelons. There is increasing recognition that PSYOP need not be limited to the hardware-supported missions of the tactical battlefield but can have important applications at the operational and theater levels, particularly in low-intensity conflict situations. But there is as yet little apparent consensus on the role of PSYOP at the strategic level or in peacetime.

The tendency to think of PSYOP in terms of direct verbal communication is a strong one, and it reflects the nature of tactical PSYOP as historically practiced by the United States. However, this is a tendency that must be resisted if the full potential of nontactical PSYOP is to be realized and if the services are to embrace the full range of PSYOP activities as legitimate and proper military missions. The uniformed military generally acknowledge that the overriding purpose of US military forces is not to fight wars but to deter them. But deterrence is a psychological phenomenon, not a simple reflection of the quantity and quality of military forces; and there is every reason to suppose that foreign perceptions of US military power can be shaped in various ways to strengthen its deterrent effect.²²

Even if one accepts that it would be difficult to shape Russian and Chinese perceptions of US power, a strong case can be made for the potentially high payoffs of efforts to shape

perceptions in third world countries. Within the third world, decision making is apt to be undisciplined, inadequately supplied with intelligence, lacking in orderly staff procedures, strongly influenced by the passing impressions and phobias of a small leadership element, and subject to sudden internal political challenge.

Much could be accomplished simply through deliberate exploitation of normal US military activities such as exercises, deployments, air and naval displays, and technology demonstrations. At a higher level of activity, with the movement of military forces dedicated specifically to a psychological-political mission, PSYOP measures shade into traditional coercive diplomacy. With activities such as naval port visits and presence, missions have generally not been understood as belonging within the PSYOP framework and do not appear to have been approached in a systematic or highly coordinated manner.

A characteristic weakness of America's approach to the use of force has been the tendency to draw sharp distinctions between wartime and peacetime. One result is the penalty exacted (in terms of organization, planning, and general readiness) in any transition from peace to war. Psychological-political warfare could compensate for temporary inadequacies in deployed US forces in severe crises or in the initial stages of war. In fact, this could be an important function for the United States. In general, a compelling case can be made for reviewing and enhancing the psychological-political component of US war planning and national-level crisis management operations.

The entire area of strategic war planning is of critical importance in this context, since it is the point at which the military, diplomatic, and psychological-political components of national strategy most closely converge. Efforts to enhance and better integrate strategic planning at the national level should focus on the difficult substantive and procedural issues involved in war planning. More generally recognized is the need for integrated interagency planning in crisis situations; but here as well the potential of psychological-political warfare seems not to have been fully realized.

The foregoing discussion highlights the part of this field that is the most neglected and at the same time the most

susceptible to immediate improvement. In low-intensity conflict theaters such as Central America, there is scope for application of, the full range of US psychological-political capabilities. The strategic importance of peacetime political warfare and international communications-with respect to the third world as well as the major powers-can hardly be overestimated. It seems clear that the best hope for diminution of political-military threats from major powers lies in the relentless exposure of their populations to information and ideas from the West. The opportunities for short-term gains should not be allowed to distract us from this fundamental strategic imperative.

Notes

1. See, for example, Paul Linebarger, *Psychological Warfare* (Washington, D.C.: Infantry Journal Press, 1948); Leonard Doob, *Public Opinion and Propaganda* (New York: Henry Holt and Co., 1948); Daniel Lerner, ed., *Propaganda in War and Crises* (New York: Stewart, 1950); William Daugherty and Morris Janowitz, eds., *A Psychological Warfare Casebook* (Baltimore: Johns Hopkins University Press, 1958); and W. Phillips Davison, *International Political Communications* (New York: Praeger, 1965).

2. On the early history of military psychological operations, see Alfred H. Paddock, Jr., U.S. *Army Special Warfare: Its Origins* (Washington, D.C.: National Defense University Press [NDUP], 1982).

3. The originally top secret report of the president's Committee on International Information Activities, headed by William H. Jackson, is now available in Department of State (DOS), *Foreign Relations of the United States, 1952-1954*, vol. 2, pt. 2 (Washington, D.C.: Government Printing Office [GPO], 1984), 1795-1867. Hereafter referred to as *Foreign Relations*.

4. Ibid., 1836-60. According to the Jackson committee report,

the national information program has suffered from the lack of effective central direction. In spite of the establishment of the Psychological Strategy Board, coordination has been lacking and the various agencies concerned have largely gone their separate ways. Opportunities have been missed to take the offensive in global propaganda campaigns.... The headquarters staffs of all agencies engaged in information work should concentrate more on the conception, planning, and coordination of global campaigns and less on detailed control and execution of day-to-day operations (1840).

For pertinent remarks on the confusion regarding the mission of US information agencies, see pages 1836-38; also of interest is this remark concerning the military role:

The contribution of the armed forces to political warfare has been limited by the lack of definition of the military role by higher authority, and by an inadequate understanding on the part of military authorities that they and their commands are full participants in the political aspects of the present struggle and must conduct themselves accordingly. Military commanders and planners tend to regard the allocation of military resources to current political operations as an unauthorized diversion from tasks for which the armed forces are explicitly responsible, (1860).

Eisenhower abolished the Psychological Strategy Board on the committee's recommendation, apparently on the grounds that psychological-political warfare was too closely bound up with US policy or strategy generally for such an arrangement to work effectively.

5. Consider, for example, John Franklin Campbell, *The Foreign Affairs Fudge Factory* (New York: Basic Books, 1971), 147-77.

6. A thoughtful discussion of the functioning of public diplomacy under the Reagan administration is provided by Gifford D. Malone, "Functioning of Diplomatic Organs," in Richard F. Staar, ed., *Public Diplomacy: USA versus USSR* (Stanford, Calif.: Hoover Institution Press, 1986), 124-41. See also Carves Lord, "In Defense of Public Diplomacy," *Commentary*, April 1984, 42-50.

7. The argument for a more political approach to multilateral diplomacy is cogently summarized by Richard S. Williamson, "U.S. Multilateral Diplomacy at the United Nations," *Washington Quarterly*, Summer 1986, 5-18. On the Soviet approach to political action, see, for example, James Atkinson, *The Politics of Struggle: The Communist Front and Political Warfare* (Chicago: Henry Regnery, 1966); and Roy Godson, *Labor in Soviet Global Strategy* (Washington, D.C.: National Strategy Information Center, 1984). On the promotion of democracy as an objective of US policy, see William A. Douglas, *Developing Democracy* (Washington, D.C.: Heldref Publications, 1972).

8. See, for example, James Cable, *Gunboat Diplomacy: Political Applications of Limited Naval Force* (New York: Praeger, 1971); and Barry M. Blechman and Stephen S. Kaplan, *Force Without War. U.S. Armed Forces as a Political Instrument* (Washington, D.C.: Brookings Institution, 1978).

9. See Richard H. Shultz and Roy Godson, *Dezinformatsia: Active Measures in Soviet Strategy* (Washington, D.C.: Pergamon-Brassey's, 1984). Soviet active measures (*aktivnyye meropriatia*) encompass what is here called political action as well as covert political warfare. For a general discussion, see Angelo Codevilla, "Covert Action and Foreign Policy, II," in Roy Godson, ed., *Intelligence Requirements for the 1980s: Covert Action* (Washington, D.C.: National Strategy Information Center, 1981), 79-104.

10. A collection of (generally older) materials on this subject is available in Ronald D. McLaurin, ed., *Military Propaganda: Psychological Warfare and Operations* (New York: Praeger, 1982).

11. A discussion of the history of US international broadcasting is available in James L. Tyson, U.S. *International Broadcasting and National Security* (New York: National Strategy Information Center, 1983). For an overview of current US activities in this area, see United States Advisory Commission on Public Diplomacy, 1986 *Report* (Washington, D.C.: GPO, 1986). Examples of public diplomacy materials produced by US government agencies are DOD, *Soviet Military Power* 1986 (Washington, D.C.: GPO, 1986) and DOS and DOD, *The Challenge to Democracy in Central America* (Washington, D.C.: GPO, 1986).

12. The role of information as an instrument of national strategy comparable to the diplomatic, economic, and military instruments was emphasized in an address of then National Security Advisor William P. Clark to the Center for Strategic and International Studies, Georgetown University, 21 May 1982. Administration studies of international information policy resulted in a presidential directive on this subject (NSDD 130) in March 1983. See "rune #Up for Term Two," *Chronicle of International Communication*, July-August 1984, 1.

13. For some critical reviews by recent participants, see the remarks of Alfred H. Paddock, Jr., and Gifford D. Malone in Staar, 297-99.

14. Sun Tzu, *The Art of War*, trans. Samuel B. Griffith (Oxford: Oxford University Press, 1971). 77-78.

15. Gen Dwight D. Eisenhower told a meeting of American newspaper editors in 1944: "I have always considered as quasi-staff officers, correspondents accredited to my headquarters." That reporters acquiesced in such treatment is scandalous for a contemporary journalist; see the discussion in Philip Knightly, *The First Casualty* (New York: Harcourt Brace Jovanovich, 1975), 315-17ff.

16. The gross abuses involved in media coverage of the Vietnam War have been well documented. See Peter Braestrup, *Big Story* (New Haven, Conn.: Yale University Press, 1978); Robert Elegant, *How to Lose a War: The Press and Viet Nam* (Washington, D.C.: Ethics and Public Policy Center, 1982; originally published in *Encounter*, August 1981).

17. An excellent brief analysis may be found in Mark Crispin Miller, "How TV Covers War." *The New Republic*, 29 November 1982, 26-33. Also of considerable interest is John Weisman, "Why TV Is Missing the Picture in Central America," *TV Guide*, 15 September 1984, 2-14.

18. The controversy arising from the exclusion of the press from the US action against Grenada in October 1982 led the Joint Chiefs of Staff to initiate a review of policy regarding media participation in contingency operations, in the form of a special commission of military and media representatives headed by Gen Winant Sidle. Although this commission reached informal agreement on the principle of press participation in all military operations to the maximum degree consistent with operational security, the DOD has since indicated some reservations on this score, and there is little evidence that any significant movement has occurred on the media side. As one retired admiral is reported to have said, "Operational

security is not the problem; the problem is that when you write about us, you make us look bad." See Fred Halloran, "The Pentagon and the Press: The War Goes On," *New York Times*, 29 January 1986; and "Material and the Media," *Essays on Strategy and Diplomacy 2* (Claremont, Calif.: Keck Center for International Strategic Studies, 1984).

19. Pertinent observations on the role of the State Department in the current administration's public diplomacy efforts are offered by Gifford Malone in Staar, 132-37.

20. Consider the complaints of Fred W. Walker, "PSYOP Is a Nasty Term-Too Bad," *Air University Review* 28 (September-October 1977), 71-76, as well as Edward N. Luttwak, "Notes on Low-Intensity Warfare," in William A. Buckingham, ed., *Defense Planning for the 1990s* (Washington, D.C.: NDUP, 1984), 197-209.

21. See the discussion in Alfred H. Paddock, Jr., "Psychological Operations, Special Operations, and US Strategy," in Frank R. Barnett, B. Hugh Tovar, and Richard H. Shultz, eds., *Special Operations in U.S. Strategy* (Washington, D.C.: NDUP, 1984), 231-51.

When Are Political Objectives Clearly Defined?

A Historical Perspective

Michael A. Moms

National policy objectives should be clearly defined. Whether the goals are strategic or tactical, they must be delineated and articulated to those responsible for implementing them.

Since the difference between clarity and vagueness in political objectives is only a matter of degree, incomplete conceptions of vague political objectives obviously leads to incomplete conceptions of clear political objectives. Nevertheless, a rough distinction can be made between vague and clear political objectives after the nature of their relative difference is understood. Most observers acknowledge that political objectives should determine the nature of military objectives and strategy-which cannot be precise unless political objectives are clearly defined.

Clarity in political objectives is the responsibility of political leaders rather than military authorities; therefore, the military services cannot be expected to impose limits on their operations if the political objectives are vague.¹ In turn, if military power is to be used efficiently and without risk of major war, political objectives must not underestimate or overestimate the military capabilities at their disposal.

Correct Generalizations

The attempts of many authors to define clear political objectives are less perceptive than their analyses of the evils that result from objectives that are vague. Most envisage clear political objectives derived from an overall objective that reflects our national purpose. They point out that limited objectives determine the nature and extent of US involvement in limited wars or interventions. Some authors add that clear

political objectives also need to be flexible so they can be adjusted to meet changing conditions.

These statements about clear political objectives are correct generalizations. Clear political objectives should be limited and should not be achieved at the price of inflexibility. Changing circumstances will always make the task of formulating clear political objectives difficult. However, attempts to go beyond generalities belie incomplete conceptualizations of vague political objectives.

A Paradox

Political objectives evince much superficial continuity and, hence, an aura of decisiveness, although they may actually encompass and conceal considerable drift and indecision. Thus, while flexibility is necessary for adapting to changing circumstances, flexibility can also become largely synonymous with drift and indecision.

Nevertheless, political objectives still may remain constant in meaning over a period of time although different strategies may be required to implement them. The difficulty is in distinguishing between political objectives that only have superficial continuity of meaning and those that really are continuous in meaning.

This paradoxical nature of vague political objectives suggests a definition of clear political objectives. A political objective is clear when it continues to represent concern for the preservation of the same specific vital interest or for the same kind of postwar peace. If the objectives are clear in this sense, they can provide adequate political direction for the choice of military objectives and strategy.

Drift occurs when political objectives are not continuous in meaning or when they are so vague as to permit several divergent strategies to appear to be adequate ways of attaining objectives. In either case, drift rather than political objectives largely determines the nature of strategy.

However, this definition applies only to those specific political objectives that guide military strategy in a specific limited war or intervention. General foreign policy objectives are, perforce, vague. For example, support of the United

Nations and interest in a world free of aggression are general foreign policy objectives that attract popular support through their vagueness.

This suggested definition of clear political objectives needs to be elaborated further by examining its relation to the concept of vital interests. Since clear political objectives must represent concern for the preservation of the same specific vital interest, it is then necessary that vital interests also be clear and specific.

Propaganda Advantages

Some propaganda advantages can be gained by grandiloquent political objectives such as the Truman doctrine's aspiration to support free peoples who are resisting attempted subjugation by armed minorities or outside pressures. However, even at that early date in the cold war, the rhetorical exaggerations involved touched off a debate charging that the United States was overcommitting itself.

The US strategy of support to Greece and Turkey against aggression refuted these criticisms; it was a clear and limited commitment. However, this clarity of strategy was due to the US policymakers' clarity of purpose and their clear grasp of US vital interests rather than to the clarity of publicly stated political objectives.

Occasionally, vital interests may be precisely formulated while political objectives are vague; for example, the Truman doctrine. Nevertheless, it is extremely difficult for political objectives to be clear when vital interests are abstract and vague.

The stark clarity of a direct Soviet confrontation with the West in the late 1940s made the determination of US vital interests relatively simple. The calculation of what were these vital interests became more complex and ambiguous as the communist threat became more diverse and subtle in the 1950s.

Abstract Vital Interests

As the paradox of abstract vital interests began to loom larger in US policy in the 1950s and 1960s, the need for clarity of political objectives continued and, perhaps, even increased as the nature of the threat changed and became more ambiguous. However, the precedent of vague political objectives set by the Truman doctrine's rhetoric continued to be the observed norm.

One of Robert E. Osgood's main themes in a 1968 paper illustrated the consequences of a heritage of vague political objectives and of increasingly vague and abstract vital interests. While the US postwar pursuit of policy objectives has shown much continuity, the US concept of its vital interests has been constantly expanding.

In Vietnam, where communist aggression was considered a threat to US security, the general requirements of containment led to an increasing US response with no question as to the precise relevance of the Vietnam War to US security. Osgood argued that the growth of multipolarity and the increasing complexity of the communist threat necessitated more precision in determining the extent to which our vital interests are involved in communist aggression.²

The paradox of abstract vital interests, then, reinforces the paradox of vague political objectives and vice versa. Together, they reinforce the indecision embedded in each vague paradox. This tends to result in policy drift and in inadequately considered, expanding commitments.

This vicious circle of vagueness and drift can be broken by efforts to relate vital interests more specifically to contemporary conditions and conflicts, and can be weakened by increasing the clarity of political objectives; that is, clarification of vital interests leads to clarification of political objectives and vice versa. More precise vital interests make it harder for political objectives to equivocate in claiming they are preserving the same specific vital interest.

On the other hand, greater clarity of political objectives would increase pressures on vital interests to be more precise. Greater clarity of political objectives would indicate the respective advantages and costs of implementing different

strategies and combinations of political objectives, which would in turn increase the chances that vague concepts of vital interests would be exposed. Such exposure would surely result in greater pressure for more precise definitions of vital interests.

Guidelines

The peculiar characteristics of vague political objectives suggest several guidelines for distinguishing clear political objectives from vague ones. Clarity of political objectives is being achieved when the following questions can be answered in the affirmative.

Is the nature of the paradox of vague political objectives understood and consciously guarded against in defining political objectives?

Do political objectives help undermine the paradox of abstract vital interests? By indicating the respective advantages and costs of implementing different strategies, do political objectives expose vague conceptions of vital interests that unwisely require prohibitive costs?

In choosing our military strategy, have we carefully considered the costs and benefits of attaining objectives that primarily demand military action versus the costs and benefits of attaining objectives that are more closely related to nation-building and internal security?

Are drift and indecision being reduced in our political objectives, our conception of our vital interests, and our choice of military strategy?

Some Thoughts on Psychological Operations

William F. Johnston

Governments of countries threatened with insurgency should regard PSYOP, particularly face-to face communications, as a first line of internal defense.

The intent of this article is not to proclaim PSYOP a panacea for "wars of liberation." The intent is to focus attention on psychological operations as a vital instrument in Ho/Mao-type wars of national liberation, especially the early stages where revolutions are hatched from grievances of the masses by communist incubation and kept at the right emotional temperature by thousands of native agitators.² Without this skillful and massive agitprop and organizational effort, which has been characterized as "half the revolutionary task," there could be no successful liberation wars.

Auxiliary or Primary?

Psychological operations should have more recognition as important instruments of low-intensity conflict.³ They have the capability to compete with the communists' conflict doctrine, which requires the integration of political, economic, psychological, and military factors of power. Aggressive nations can successfully use PSYOP on a case-by-case basis in subversive insurgency-threatened countries. PSYOP use, however, must be carefully calculated in policy and operations to reach the grassroots level. Whoever gets to the people first, with ideas that stimulate self-interest, gains a decisive lead ... and that is precisely what happened in Vietnam.⁴

Use of Media Discounted

Looking at the Vietnam War in retrospect, we see that the communists used all available media, from instigation through propaganda and guerrilla warfare to conventional military operations. Such sophisticated mass media as printed materials, leaflets, posters, pamphlets, and radio broadcasts were more obvious than the workhorse of the revolution: the agitprop cadre who operated on a face-to-face basis in the rural villages and hamlets. The US discounted the sophisticated media in the early days because it did not seem to play an important role.⁵ What no one understood at the time was that radio was being used to communicate the Communist party line to the agitprop cadres in the remote areas of South Vietnam. They, in turn, were translating the party line into action among the masses. Based on opportunities at the local level, the actions generally consisted of study sessions (learning how to read and write Vietcong propaganda), demonstrations, parades, rallies, and any other activities that would get the people involved-ostensibly in furtherance of the peoples' interests, but with the end objective of strengthening the Communist party and weakening the opposition. The US did not appreciate the magnitude of the agitprop cadres-their numbers, their effectiveness, or the extent to which they were able to get the people engaged in furthering communist propaganda.

Douglas Pike, a noted expert, claims that the various social organizations created by the Vietcong in South Vietnam and used by the agitprop cadres were developed as "self-contained, self-supporting channels of communication." In his view, these organizations were the "secret weapon" and the "heart and power of the National Liberation Front (NLF)."⁶

Pike also revealed that the Vietcong "spent enormous amounts of time, energy, manpower, and money ... explaining itself to itself, to the other side, and to the world at large." He said they were "obsessed" with doing this. Pike found that the more he studied the Vietcong, the more "it became evident that everything the NLF did was an act of communication."⁷ In other words, everything the Vietcong did was calculated to gain the optimum psychological effect.

Policymaker and Propagandist

In the communist world, psychological operations /warfare experts are represented at the highest levels of government and within the Communist party. One of their roles is to help make policy. PSYOP experts in the United States and most of the free world, however, (except for Nationalist China) appear to have little status and not much influence; several reasons are offered below.

1. Psychological operations /warfare, including propaganda, has a distasteful image. It is thought to deal in lies and variations of the truth, and is looked upon in general as a dirty business with which few wish to be associated.

2. Psychological operations cannot be scientifically evaluated as to effectiveness. PSYOP activities that cannot produce fast, measurable results are hard to sell. There are exceptions, of course; for example, when tactical PSYOP can be used to encourage a beaten enemy to surrender or in an amnesty campaign where the defectors can be counted.

3. There are very few professionally qualified and experienced PSYOP experts who also have sufficient acquaintance with the people of a specific foreign country. A major reason is that little status, low prestige, few rewards, and no high-level promotions are based on professionalism in psychological operations. There is no psychological operations career program; yet, attaining full qualification as a psychological operations expert on a specific foreign country is a lifetime job, not unlike the type of professionalism required of a psychoanalyst.

4. Insurgency-threatened countries do not give enough attention or importance to psychological operations. They often lack the know-how to start an effective psychological operations program, and they tend to place the same priority on PSYOP that the United States does in its support of that country. This priority is usually relatively low in proportion to the overall assistance provided by the US. While in the later stages of an insurgency the US may help with such sophisticated media as printed leaflets, radio, and TV, the US usually lacks expertise in the language and ways of the people. This expertise is necessary to provide advice on the content of the message to ensure that the message achieves the desired

effect. **The main burden of face-to-face education must be on the shoulders of the indigenous government and people.**

Another problem is that of convincing an insurgency-threatened government to establish an uncomplicated but credible amnesty program early in the insurgency. This program would provide, for insurgents who have changed their minds, a way out of the "victory or death" box that the guerrilla is usually in.

Chieu Hoi

The Chieu Hoi (Open Arms) Amnesty Program was one of South Vietnam's most successful programs. However, considerable time was required for the program to build up credibility and to achieve the desired results.⁹ Initially, Vietcong who wanted to defect believed, as the Vietcong indoctrination claimed, that they might be shot.

After the low point at the end of 1964, the Chieu Hoi program showed a steady increase in the number of Vietcong returnees. In 1966 there were over 20,000 defectors, double the number of the preceding year. Total defections of Vietcong returning under this program numbered more than 75,000.¹⁰ If we accept the ratio of 10 government soldiers needed for each insurgent guerrilla, this program saved the GVN and the US a troop strength of over 750,000 soldiers. From the dollars-saved angle, the total cost of the program, using a figure of \$127 to bring in a Vietcong defector, was around \$9.5 million. Since the cost to kill a Vietcong is estimated at \$300,000, killing this number of soldiers would have cost \$2.25 billion.

Indigenous Armed Forces

The United States can and should give a higher priority to encouraging insurgency-threatened governments to develop a professional psychological operations capability. This capability must include personnel, both American and indigenous, who can conduct face-to-face psychological operations. Indigenous PSYOP people must be able to

overwhelm communist-trained agitators in both quality and quantity of ideas related to peoples' desires and fears if they are to get the people motivated and committed to the government.

Indigenous military forces, paramilitary forces, or police forces would be good organizations to undertake increased PSYOP responsibilities in the rural areas. One reason is that these forces represent the best organized and most cohesive institutions in many developing countries, particularly in the rural areas. Also, better results will be achieved in the remote rural areas if the peasants know that an iron fist is underneath the velvet glove of the communists' friendly persuasion. (Changing the ways of peasants is a real challenge.)

Every member of those military and police forces that are in contact with rural people should be trained to talk to the people-and doing so should be required as part of their duties. This would include interpreting news and participating in educational activities. They must also be prepared to discuss persuasively what the government is doing for the local people.

The main focus should be on developing specialized PSYOP units in the rural areas. These units should consist of local natives. Very important, also, is the establishment of a two-way communication system to ensure that popular grievances and good ideas get to the PSYOP planners and decision makers at the top level-and that governmental PSYOP policy guidance gets down to the lowest PSYOP level. This policy guidance must be centralized and controlled at the top, but implementation of the policy must be decentralized at the grass roots.

Lower-level PSYOP people should spend about one-half of their time in investigating and preparing so as to tailor their talks and educational activities to fit the local needs. Once the real needs of the rural people are ascertained and transmitted to the top echelons, there is more reason to hope that the government will help the people help themselves. This would go a long way toward preventing the communist agitators from generating revolutions out of grievances, hatreds, and social injustices.

Conclusions

In conclusion, insurgency-threatened governments can be expected to heed US advice if it is in the form of lessons learned at great cost. Indigenous governments must put a high priority on psychological operations, particularly on face-to-face education and on countering communist agitators. These governments must recognize that a face-to-face psychological operations capability must be developed from the people, by the people, and for the people of each particular language group, tribe, clan, or area of the country-and this takes time. Developing a successful capability requires careful selection and training of candidates. This is not something that can be "made in the USA" and exported.

The US military can and should develop mature, fully qualified, professional PSYOP experts who are experienced in the language and the thinking of a foreign people. Such experts could help governments with PSYOP organization and management, as well as providing support with our more sophisticated mass media. Psychological operations planners, both US and indigenous, must be raised to the first-team level. This is crucial for success! PSYOP planners must have ready access to top authorities. Governments must translate top-level interest and support into meaningful terms for people at the grassroots level. Feedback from the people to the top level is equally important. This interest from government is essential to winning and maintaining the support and loyalty of the people. Such a psychological operations program would be one of the cheapest and best security investments the US could make in the developing world.

Notes

1. This article consists of excerpts from "Neglected Deterrent: Psychological Operations in 'Liberation Wars'," *Transition*, nos. 12 and 13 (January 1968): 58-65. Reprinted with the permission of the Foreign Affairs Executive Seminar, Foreign Service Institute, and its author. The communist psywar instrument was simply a means to an end-communist domination over everything that was not already under communist control.

2. Late in the China conflict, Gen George C. Marshall realized that the battle for the mind waged with ideas and propagated by mass communications media could be decisive in countering the liberation war in China. In

1947, upon return from his unsuccessful mission to China, Marshall said, "China might have been saved by the massive use of radio and motion pictures, on a scale hitherto unheard of." William Benton, "How Strong Is Russia? And How Weak?" *New York Times Magazine*, 10 June 1956, 70.

3. Robert Holt and Robert Van de Velde, *Strategic Psychological Operations* (Chicago: University of Chicago Press, 1960), 64. These authors state that the US has never fully understood the nature of the psychological instrument.

4. Stefan Possony in "Viet Cong Propaganda War," *Los Angeles Times*, 11 July 1967, gives a good analysis of international propaganda based on captured documents. He concludes that although Americans are not conscious of it, the US was the target of a well-orchestrated and skillful Vietcong propaganda offensive after 1961.

5. Radio Hanoi and Vietcong clandestine transmitters were important for getting the Communist party line and other instructions to the leadership and agitprop cadres in remote areas-information which otherwise would have been delayed for weeks. Broadcasts were made in all five major languages used in Vietnam. Beginning in 1960, there was an increase in the use of all types of media in an accelerated propaganda offensive against the government of Vietnam.

The Role of Public Opinion

Lloyd A. Free

Public opinion cannot be slavishly followed, but psychological data should be collected and analyzed so that government can take this factor into account in planning.

The following excerpts are from an exchange of letters that took place at about the time of the Vietnam moratorium in the fall of 1969. One writer was a Georgetown University sophomore with the unknown name of Randy Dicks, the other a president of the United States with the well-known name of Richard Milhous Nixon.

Randy wrote the president:

I think that your statement at your recent press conference that "under no circumstances" will you be affected by the impending antiwar protests in connection with the Vietnam moratorium is ill-considered, to say the least. It has been my impression that it is not unwise for the President of the United States to take note of the will of the people. After all, these people elected you. You are their President.

The president replied, in part:

There is a clear distinction between public opinion and public demonstrations. To listen to public opinion is one thing; to be swayed by public demonstration is another.... Whatever the issue, to allow Government policy to be made in the streets would destroy the democratic process. It would give the decision not to the majority and not to those with the strongest arguments, but to those with the loudest voices.

Introduction

What is the role-the actual and proper role-of public opinion in international security affairs? And how, if public opinion does and should count, is majority opinion to be determined?

The assumption that public opinion, both at home and abroad, is somehow important is borne out by the efforts of political leaders to woo it and by the practices of governments to influence it. All major governments in the world today, and many of the minor ones, spend varying amounts of time, money, and attention on attempts to influence the opinions of their own citizens and the citizens of other countries.

Yet, even in our recent history, when a sense of the importance of public opinion has become more self-conscious than it used to be, there have been unbelievers. Harry Truman, whom I nevertheless admire as one of our great presidents, was one of them. When Mr Truman faced a problem, he would find a principle involved, often a moral principle, and then make his decision accordingly. And he would stick to that decision come hell or high water. With this approach, public opinion and opinion polls are irrelevant, you simply do what you think is right.

The late, great John Foster Dulles adopted this same approach. He once said in my presence:

If I so much as took into account what people are thinking or feeling abroad, I would be derelict in my duty as Secretary of State.

Another of our great secretaries of state, Dean Acheson, claimed, disapprovingly, that Americans have a "Narcissus psychosis." "An American," he wrote, "is apt to stare like Narcissus at his image in the pool of what he believes to be world opinion." After making the point that the only honest answer people generally could give to questions about the specifics of foreign policy would be a "don't know," he made this observation:

World opinion simply does not exist on matters that concern us. Not because people do not know the facts-facts are not necessary to form opinions-but because they do not know the issues exist.

Thus, we are faced with some very basic questions: Does such a thing as world opinion exist? Do people in the United States and other parts of the world really have meaningful opinions of any significant scope in regard to international issues? If so, are these opinions of importance to foreign relations and international security affairs? Your own instinctive answer to these questions may be an unqualified

"yes" or an unqualified "no," but after years of experience in the public opinion field, my own answer is very equivocal-namely, it all depends.

Definitions and Assumptions

To start with, I must define some of the terms we will be discussing. An opinion, in my terminology, is simply an expressed attitude-an attitude that is communicated. An attitude, on the other hand, is really more of a perception-a way of looking at a given subject.

In the course of our lives, we build up all sorts of assumptions based on our experiences and these assumptions influence what we perceive as the world in which we live. In other words, we participate in creating our own realities and our attitudes spring from these "realities." They are the result of an interplay of our assumptions, as shaped and modified by experience. In a very real sense, if an individual has no assumptions concerning a given subject, or that are capable of being related to that subject, he can have no attitudes-and hence no opinions. And any opinions expressed by an individual will be meaningful only if he in some way relates the subject to his own purpose, no matter how narrow or broad it may be. The range of his sense of purpose is delimited by his "reality world."

Every individual has blind spots of greater or lesser scope-that is, subject matter areas about which he has no assumptions and, hence, no attitudes. It is difficult for many people to realize what a large proportion of the people of the United States, not to mention the underdeveloped areas of the world, have no assumptions, attitudes, or information about international affairs.

Let me cite from a study I did in this country a few years ago. One-quarter of the American public had never heard or read of NATO, only 58 percent knew that the United States is a member of NATO, and only 38 percent knew that the Soviet Union was not a member-facts which go to the very nature and fundamental purpose of our most important alliance! One-quarter of the adults in this country did not even know that the government of mainland China is communistic!

In short, at least two-fifths of even the American people are far too ignorant about international affairs to play intelligent roles as citizens of a nation that is the world's leader-and only about one-fourth are really adequately informed. The situation in most other countries of the world is far worse, particularly in underdeveloped areas. For pollsters to ask these uninformed people about specifics of foreign policy is obviously an exercise in futility. Looked at in this perspective, one can begin to see the validity of Dean Acheson's views and to question the common assumption that, if enough people at home and abroad are persuaded to adopt a given opinion, then the policy of their government will be affected-at least in democracies.

Opinion Leaders and the General Public

Before we write off the importance of public opinion in international security affairs, however, let us introduce some other aspects of the problem. First, we must recognize that when it comes to the "nitty-gritty" day-to-day decisions on specifics, public opinion usually has no effect. Either the public has no opinions on the matter or people do not know that decisions are being made. On a broad range of matters that are publicly known, there is usually an educated elite who do have meaningful opinions, in varying degrees of intensity, about international security matters.

This elite may be of greater or lesser size, depending upon which country is involved and which issue is in question. However, the fact that it may be small does not derogate its power. We can meaningfully define world opinion abroad or significant opinion at home in terms of the publics that count in the particular situation, whether limited or mass.

Beyond this, however, elements of the public can and often do get into the act, not only in the United States, but also in the underdeveloped areas. The people may lack meaningful opinions on a wide range of specifics about international matters, but their broader assumptions may come into play at certain times and places to make a given international issue a matter of public concern. Often this applies only to a minority of the greater public; frequently the people are whipped up and

organized for ulterior ends, whether by the communists or by local leaders-but react they do!

Publication

The action may be as peaceable as signing a petition or writing a letter to the local newspaper (both of which are apt to be relatively ineffective), or to writing a personal letter to the president (as Randy Dicks did), or writing to one's congressman. (The latter action may actually be of some influence; the attention paid by members of Congress to their mail is out of all proportion to its significance as a barometer of public opinion.)

But, increasingly, more extreme manifestations of public action-demonstrations, picketing, and rioting-reflect attitudes that are strongly held by at least some segments of the public. These forms of public action have become a phenomenon of worldwide scope. For example, rioting in Japan and Korea made it exceedingly difficult for the two governments to normalize their relations. Demonstrations in Panama were unquestionably instrumental in causing the US-after a decent interval, of course-to agree to revise the Panama Canal Treaty. Demonstrations and potential riots in the Middle East have made it difficult for the Arab governments to follow a policy of moderation in the Arab-Israeli conflict. Anticommunist violence in Indonesia strengthened the hand of the army against the Communist party in a struggle that has had profound international implications. Anti-Vietnam protests in the United States unquestionably affected the calculations of the North Vietnamese, not to mention those of our American leaders.

But the greater public also gets into the act in a more regular and generally more peaceable way in the form of periodic elections, not only in the democracies but also in some of the semidemocracies (if not the "guided democracies"). In such elections, international matters can and often do enter as central issues of the campaign.

But then, one does not have to search very far back in US history for other examples: Woodrow Wilson's campaign theme, "He kept us out of war," helped him win the election in 1916; and Gen Dwight D. Eisenhower's promise to go to Korea

increased his landslide victory in 1952. In fact, it is almost axiomatic that whenever war or peace seems to be at issue, the public in almost every country will exhibit deep concern in ways that have political meanings.

Global Public Opinion

More broadly, a close study of the matter has convinced me that there are widely shared attitudes on international matters, amounting in many instances to consensuses which governments simply must take into account. Sometimes these consensuses are global. With apologies to Dean Acheson, there are, on occasion, worldwide or virtually worldwide reactions on matters that concern us.

One occasion was the Suez affair in 1956. I have little doubt that the United Nations well-nigh universal condemnation of the Israeli-British-French invasion of Egypt was supported by what can only be called a consensus of world opinion-a consensus shared even by many people in both the United Kingdom and France.

A similar consensus of condemnation seems to have existed over the Soviet Union's occupation of Czechoslovakia-a consensus apparently shared even by a good many people who were communists themselves.

Another is the worldwide impact of Russia's launching the first two sputniks in 1957, followed by its subsequent achievements in space. These developments led to reevaluations of the relative standings of the two superpowers, extending not only through official circles and elites but to general publics as well. In fact, data show that people throughout the world ranked the Soviet Union and the United States just about equally in terms of power and importance in those days, an enormous contrast from the days before 1957.

This perceived equality contributed, along with other developments, to the idea that a stalemate existed-a notion that affected the foreign policies of most of the world's nations.

Regional and National Attitudes

Short of these global consensuses, some basic attitudes are so widely held in certain regions or areas that they must be taken into account, both by the governments which rule there and by others dealing with them. The phobia in Latin America against American intervention is one example. Similarly, in almost all of Africa and Asia, basic attitude patterns opposed to imperialism and neocolonialism are deeply rooted. Other examples are the anti-Israeli "set" of the Arab world and, fortunately for us, the anti-Chinese bias in much of Southeast Asia.

In addition, there are many situations where there is a meaningful consensus of public opinion in particular countries. One example is the almost universal aspiration that the West Germans held for Germany's reunification. Other examples are the fear and hatred of Germans that were held by most Russians and Poles, and the Japanese public's opposition to full-scale rearmament.

The American people, too, have certain fixed ideas. One is opposition to foreign aid: Six out of 10 Americans favor either reducing economic aid to foreign countries or ending it altogether. Another is the very high degree of concern to keep our military defense strong at the same time that more than one-half of the public thinks we are spending too much on defense. In a related vein, almost six out of 10 Americans think the US "should take all necessary steps to prevent the spread of communism to any other parts of the free world, no matter where." Anticommunism is, in fact, clearly one of the strongest factors in Americans' ideas about US international security policies.

Policies and Opinions

In any particular country at any given time, there are programs and policies for which no government or leader can engender public endorsement. In other words, the climate of opinion imposes limits-sometimes very broad, sometimes very narrow-on each government's area of maneuver. In the extreme, certain things are virtually taboo; in other cases, they

are merely impolitic; in still others, particularly where public opinion is either in agreement, nonexistent, divided, or lacking in intensity, anything is acceptable. Although policymakers sometimes appear blind to the fact, the achievement of many-if not most-of the international security objectives adopted by the United States presupposes certain perceptions, attitudes, beliefs, and behaviors on the part of various persons in this and other countries.

Usually, on day-to-day matters, the opinions of key members of Congress and/or officials of foreign governments are important for the accomplishment of particular US objectives. On more important matters, the list of people who have influential opinions may include members of elite groups that have power or influence in our own or other societies. Often, the educated elements of the general public may also have a bearing on the success or failure of US policies. Frequently, the opinions of peoples as groups are important, either because popular support or cooperation is necessary or because the people show their concern by way of protests, demonstrations, or elections.

Often, psychological factors are critical to the success of US policies. If these factors are absent, it is futile to adhere to a policy which presupposes them. Taking into account, for instance, the feelings of the majority of the Chinese people toward the Chiang Kai-shek regime in 1949, no amount of effort or determination on the part of the United States could have prevented a communist takeover of mainland China. As another example, consider that the US supported French rule in Algeria for years, despite the fact that the psychology of the Algerians-not to mention the French-made this goal impossible.

In another aspect of French international security affairs, it was public opinion, more than anything else, that forced the French military to fight the Indo-Chinese war with one hand tied behind its back; victory was impossible. The French people would not condone the necessary national effort, so the government found it impolitic to send draftees to fight in Indochina. The current malaise in the European community and the disarray in NATO are prime examples of the limits that psychological factors can place on national objectives.

Public Opinion, Political Pressure, and Prophecy

Finally, to prove what a valid prophet I can be on occasion-and, of course, I like to forget those instances where my judgment proved faulty-let me quote from a lecture I delivered when the trends of American opinion about the war in Vietnam were still pretty obscure.

Our own Government will undoubtedly now have to face up to the fact that the American people are sick and tired of the war. It is my considered judgment as a so-called "expert" that we are in the early stages of an inexorable tide in favor of pulling out of Vietnam. There may be riptidA from time to time which will temporarily obscure the direction of the current, but it is my belief that however you and I may feel about the matter, the movement down below will continue ever more strongly in favor of disengagement.)

Of course, as usual when I stick my neck out, I had some data to rely on. In the aftermath of the Tet offensive, studies conducted in this country showed that in mid-February 1968, immediately after the offensive, the majority of Americans remained hawks. In fact, hawkish sentiment increased in the immediate sense after the Tet offensive, favoring further escalation of the war. One-quarter of the American people advocated gradual escalation and no less than 28 percent opted for "an all-out crash effort in the hope of winning the war quickly, even at the risk of China or Russia entering the war."

By June of the same year-1968-the picture had changed materially. One-half of the public had shifted to the "dove" side, with 7 percent favoring a cutback in the American military effort and 42 percent wanting us to discontinue the struggle and start pulling out of Vietnam-this latter figure being almost double what it had been just four months earlier.

By June of 1970, Gallup had found that the proportion of people thinking that the US had "made a mistake in sending troops to fight in Vietnam" had risen from 25 percent (in March of 1966) to 56 percent. About one-half of the people now favored withdrawal, either immediately or at least by July 1971.

Policymakers and Public Opinion

There is a real question about the sensitivity of our policy-makers to psychological factors that have a bearing on the success or failure of our international security objectives. There is also a question about those policymakers' receptivity to the results of public opinion polls and other forms of policy-oriented psychological research. I can only speak on the basis of my own experience and that of my late associate, Hadley Cantril, plus years of personal observation of the government process. And from these points of view, I would say that the record is spotty at best. However, recent presidents have shown an awareness of the importance of psychological factors.

Oddly enough, the supreme example of sensitivity to public opinion-and of consummate ability to influence it-came in the earliest days of scientifically conducted polling. The man of the hour was Franklin D. Roosevelt. Tommy Corcoran once credited Roosevelt with having said, in effect, that he was the captain of the ship but that events and public opinion limited his power while providing instrumentalities for exerting power.

Particularly after the adverse reactions to his famous "quarantine" speech, Roosevelt was determined not to get too far out in front of public opinion in connection with the war in Europe-nor to stay any farther behind than he thought he had to. In this connection, he followed the polls with great interest-particularly charts of American public opinion specially prepared for him by Mr Cantril, who had conducted surveys throughout this period.

President Eisenhower

President Dwight D. ("Ike") Eisenhower was less consciously interested in domestic public opinion polls than Roosevelt had been. This was probably in part because Ike was so popular and his administration so relatively noncontroversial. But I know from my own experience that he was deeply interested in the opinions of people in other countries. While working with Nelson Rockefeller, who was a consultant to the president in

1955, I started a series of periodic reports on the psychological situation abroad.

The president read these reports carefully and followed them with great interest. (The common notion that he did not read documents is ridiculous; every single report I submitted to him through Rockefeller was read-and annotated-by the following morning. And this goes even for a 67-page document, single-spaced, which I know he read in full because he corrected a typographical error in his own hand on the next-to-last page!)

On more than one occasion, after John Foster Dulles had given one of his masterful briefings to the National Security Council (NC), the president was heard to say, "But, Foster, you forget the human side," as he pulled out one of my reports and read from it. As a result of that, I was the second most hated man (by Dulles) in Washington, Rockefeller being the first!

By 1955, my reports to President Eisenhower had shown a sharp increase in skepticism abroad about America's peaceful intentions. This skepticism helped to create receptivity to an idea that Rockefeller had advanced and which had been cold-shouldered-namely, the "Open Skies" inspection proposal. When Eisenhower finally propounded Open Skies, it had as great a psychological impact as any one-shot propaganda move since World War II.

President Kennedy

Jerome Wisener says that John Fitzgerald Kennedy knew clearly that he could exercise his power only if he had the consensus of the people and the Congress behind him. As a result, Kennedy was a fervent believer in polling. He depended heavily on the findings of special surveys conducted for him by Lou Harris on domestic opinion, including international issues. He also followed closely the United States Information Agency (USIA) data on opinion abroad. On a number of occasions, he personally requested that certain surveys be made-especially in Latin America.

In the aftermath of the Bay of Pigs, USIA found that Fidel Castro was little known in Latin America and was generally viewed by the public with considerable allergy. Subsequently,

the Kennedy administration adopted a relatively low-keyed approach to Castro and Castroism.

President Johnson

In the early days of his administration, Lyndon Baines Johnson regularly used Oliver Quayle's polls, including those on international issues. President Johnson kept a loose-leaf notebook, not only of the latest surveys taken in the United States by Quayle, Gallup, and Harris, but also of polls conducted abroad.

Following the American intervention in the Dominican Republic, I sent to the White House a report I had prepared in June of 1962, *Attitudes, Hopes and Fears of the Dominican People*. It showed that the Dominicans, as of then at least, were the most pro-American, anticommunist, anti-Castro people we had found in any part of the world. Not only did President Johnson read the report; the White House had it duplicated and distributed at the highest level and said that it had proved "very helpful." I have little doubt that this report was one of many factors that influenced the Johnson administration to shift from supporting the military junta to working toward a coalition solution.

Against such "successes" as these, however, must be set some glaring "failures," where research findings were ignored in framing US policies. The most cataclysmic of these had to do with the Bay of Pigs invasion. A year before, I had managed "by the skin of my teeth" to get a public opinion study done in Cuba. It showed that Castro was overwhelmingly popular with the Cuban people. There was a small opposition, but it was confined almost entirely to the city of Havana. Thus, whatever the expectations of those who planned the invasion, it came as no surprise to many that there was no popular uprising to assist the Bay of Pigs invaders.

The study had been made available to the government as well as to the public, and had actually been sent up to the White House. However, between the time the report was issued and the attempted invasion, there had been a change of administration—Kennedy had come into the White House. And our findings were not called to the attention of the new

president or anyone on his staff when they were considering the question of invading Cuba.

Although called a "success" when submitted to President Johnson after the Dominican intervention in 1965, a Dominican study conducted after the fall of Trujillo found that the invasion had been a "failure" when the results were originally made available to the government in 1962. The report included the following flat statement:

An extremely serious situation of popular discontent and frustration, fraught with a dangerous potential for upheaval, exists in the Dominican Republic. Never have we seen the danger signals so unmistakably clear.

Yet, despite this urgent warning, the US government devised well-merited but long-range solutions to Dominican problems and neglected short-term emergency programs which might have avoided later problems.

The neglect of such research findings demonstrates a fact which has become crystal clear to me from my years of experience within the State Department and my subsequent observations as a researcher and government consultant. A considerable proportion of our government, with particular reference to the State Department and the Foreign Service, tends to be insensitive to the importance of psychological factors in international affairs. Within our US government there is no systematic collection of such data and, despite the interest of the White House, no systematic marshalling of whatever material may be available. (It is not without significance that the special polling of American public opinion that was inaugurated by the State Department after World War II and was conducted under the very distinguished and able direction of Schuyler Foster, whom some of you probably know, was discontinued in the latter half of the 1950s.)

As to psychological factors abroad, more than one ambassador has echoed the words of one of their colleagues: 'To hell with public opinion! I'm here to deal with the government, not with the public!' He said this, incidentally, while serving in a country which later went into an acute crisis because of public turbulence.

It is against this multifaceted background that I said the record of our policymakers is spotty when it comes to paying

attention to "the psychological." Some policymakers (particularly at the highest level) have paid attention; some have not.

Conclusion

In closing, let's put this whole matter into broader perspective. No responsible critic maintains that our government should slavishly follow public opinion or that US foreign policy should be based exclusively, or even primarily, upon courting momentary popularity at home or abroad. Often, governments that deserve the adjective "responsible" will have to fly squarely in the face of domestic opinion while attempting to change it.

Bill Moyers once told a story that is pertinent in this respect: During a period of crisis, President Johnson and his advisors were meeting in the cabinet room to discuss alternative courses of action. At a particularly exasperating moment, when no option appeared likely to succeed, one of the men exclaimed wearily: "If we only knew what the people of this country really want us to do!" The president studied his melancholy advisor for 39 seconds, then answered: "If we knew what they wanted us to do, how could we be sure that we should do it?"

Any government worthy of its name has to do what it thinks necessary for the good of the country, but its course can be greatly eased if it has public opinion on its side. Decision making demands a knowledge of how the people are thinking and feeling-and why.

Even more often, governments must fly in the face of opinion abroad. This is especially true of the United States as it pursues its role of world leadership: if we aid India to rearm against the Chinese threat, we are bound to incur the wrath of Pakistan; we cannot assist Israel without provoking an anti-American outburst from the Arab world; fighting the war in Vietnam enraged the "doves" in many parts of the world. It is clear, then, that a certain price must be paid in at least psychological terms-and it should be incurred knowingly, after both a careful assessment of the benefits and risks and a calculated attempt to devise ways to minimize unfavorable impacts and maximize favorable ones.

After the Tet offensive, Gen William C. Westmoreland said that the results were psychological, not real. Well, he and his colleagues had better learn that when it comes to accomplishing US objectives, psychological factors can be just as "real" as guns, ships, planes, or nuclear weapons. This is because human beings are always the ultimate movers and shakers, and humans are psychological animals.

In short, psychological data needs to be systematically collected and cranked into the intelligence appraisals of given situations. And these data, both domestic and foreign, should be taken into account in framing foreign policies and enunciating interfiational positions. The psychological requirements for achieving US objectives need to be carefully calculated from the start, and every effort must be made, through leadership, persuasion, and public diplomacy, to secure their fulfillment.

Simply put, psychological data is essential if the United States is to be an effective leader in today's world. And its employment is imperative if the president of the United States is going to lead a unified American people into the future.

A Critical Analysis of US PSYOP

**Lt Col Philip P. Katz, USA, Retired
Ronald D. McLaurin
Preston S. Abbott**

In an era during which it has become very fashionable to discuss the psychological aspects of international relations and during which the study of that field has been greatly influenced by psychological theories and research, particularly in America, little attention has been focused on the communications aspect of international relations; that is, psychological operations. In this essay, we identify and assess the principles of-and some developments in-this field. We also advance several modest proposals for further progress in analysis.

Introduction

Psychological operations is that specialized field of communications that deals with formulating, conceptualizing, and programming goals, and with evaluating government-to-government and government-to-people persuasion techniques. Properly defined, PSYOP is the planned or programmed use of human actions to influence the attitudes and actions of friendly, neutral, and enemy populations that are important to national objectives.) The critical variable is, then, the perceptions of foreign populations.² Propaganda is only the most obvious example of a persuasive communication. Because psychological operations are designed to influence actions or attitudes, the parameters of the field can be seen in terms of Harold D. Lasswell's classic communications model:

*Who Says What
In Which Channel
To Whom
With What Effect.*³

We know that a government spokesman is saying something in some channel to foreign populations with a view to influencing them. The specific operation is then defined on the basis of what, in which channel, and with what effect. Psychological operations, then, is a truly interdisciplinary phenomenon, lying in the interstices of psychology, sociology, communication, and political and military sciences.^{4,5} PSYOP is communication that "embraces the study of persuasiveness, on the one hand, and persuadability on the other. It also involves the study of attitudes-how they are formed and how they can be changed."⁶ In practice, however, psychological operations requires inputs from linguists, ethnologists, historians, cultural anthropologists, and area specialists, along with others from the humanities, natural sciences, and social sciences.

Historical Review

Leaders have used persuasive appeals as far back as recorded history allows us to search; Americans, authors of the Declaration of Independence and other brilliant psychological operations, were far from unfamiliar with this tradition. The process of psychological operations remains essentially what it was when Gideon defeated the Midianites but, like many other human enterprises, it has become infinitely more complex. The development of mass communication-broadcasting, worldwide wire news services, mobile printing presses, motion pictures-provides instruments of psychological operations previously undreamed of, as may be seen from the scale on which they were used in World War II as compared with previous wars.

No one who lived through or read about the collapse of France in 1940 will ever forget Goebbels's development and use of psychological operations as major political and military weapons of attack. The Nazis orchestrated the use of radio, the press, demonstrations, group meetings abroad, agents, displays, fifth-column terrorism, and, once the attack started,

screaming dive bombers (the memory of which is terrifying to many). The Nazis gave the first full-dress demonstration of what psychological operations can accomplish with the new tools of mass communication and the new weapons of military warfare. And once the meaning of what they had done came to be understood, all the major combatants who had not already done so were compelled to institutionalize psychological operations in their own plans and concepts of modern war. Nevertheless, while there were many programs, no systematic, centralized planning was undertaken in the United States until World War II^{9,10}—and the organization and resources developed during the war were quickly reduced following its conclusion. There was some effort to study the lessons learned from PSYOP programs, but the analyses were disseminated unevenly in the government and military services. The civilian Office of War Information (OWI) was disestablished and the propaganda function was passed to the Department of State.

During the 1950s, however, American psychological operations received renewed attention. The highly ideological character of the cold war rivalry and the political nature of the Korean War led to an emphasis on the psychological aspects of conflict. Courses of instruction were developed and "PSYOP" was rationalized within the services. In the civilian government structure, PSYOP was rationalized within the United States Information Agency (USIA). During this period, which was characterized by a political more than a military conflict, channels such as "Radio Free Europe," "Radio Liberation" (later "Radio Liberty"), "Radio in the American Sector" (RIAS), and the "Voice of America" (VOA) were primary PSYOP agents. They communicated news, ideas, and opinions across political boundaries—not infrequently with significant effects.

Unquestionably, the largest American effort in psychological operations since the second World War occurred during the Vietnam War. From the 1950s until the early 1970s, the US government placed substantial emphasis on psychological aspects of its world role, first in its rivalry with the Soviet Union, second in its assumption of global leadership, and finally in Vietnam and other local conflicts. However, the growth of detente and the apparent failure of PSYOP in Vietnam contributed to a continuation of the pattern whereby persuasive

communications resources are drastically reduced when there is no longer a perceived immediate need for them.

General Principles

Effective psychological operations requires several basic ingredients: adequate intelligence, coherent organization, sound planning, and a systematic evaluation of feedback. Intelligence is the most commonly overlooked prerequisite to an effective PSYOP program. From a PSYOP perspective, intelligence is the basis for understanding the communications, emotions, attitudes, and behavior of individuals and groups.

Basic to the understanding of persuasive communications is the fact that audience factors are the principal constraint on communication effects. Although studies have been conducted on source attractiveness, trustworthiness, and background, it is the audience's perceptions of credibility that count. ¹¹ Explorations of the phrasing, ordering, and other presentation factors continue to show that the critical variables in determining communication effects are audience factors—education, exposure to opposing views (previous or subsequent to the message), extant opinions, and culture. ¹² In addition, such wholly audience considerations as target composition and persuadability are clearly beyond the influence of any communicator. ¹³

Since the target population in effect sets the parameters of persuasion, intelligence must provide sufficient accurate data to support the development of programs and messages to optimally affect the audience in all its diversity. ¹⁴ Information must be timely, thorough, and systematic.

Organization is important because it must unify the diverse parts of the complex process of intercultural communications. Without sound organization, no single aspect of the process can contribute efficiently to the system. Breakdowns will occur within as well as between program responsibilities. Examples are given below.

Planning is essential at all levels, from tactical operations to long-range, strategic activities. The psychological plan, the basic instrument for integrated and concerted operations, must be designed to exploit all of the source advantages possible. The plan should use intelligence to determine the

media, messages, and compositions most likely to support the attainment of national objectives.

To implement PSYOP plans, the program must extend beyond words to actions-and actions must be an extension of words. An effective program of persuasive communications draws on real action attributes and elaborates a realistic and concrete future course. Political and military actions are critical elements in psychological operations.

In order to continue to improve the effectiveness of the program, a system to collect, analyze, and exploit feedback on past operations must be established. Because of the weakness of traditional measures of PSYOP effects, this requirement has too often been neglected.

Organization

It is perhaps a truism to say that an organization should be so constituted that it is capable of effectively carrying out the functions assigned to it. In this section, we emphasize the essential functions of psychological operations and explain how these functions are currently managed in the United States.

An institutionalized structure is essential for the effective implementation of psychological programs. There must be a defined organizational structure with clear lines of authority and responsibility for the development and implementation of policy, plans, and operations. Whether strategic or tactical in scope, the psychological operations mission requires the staff and personnel necessary to develop and implement policy, develop and execute plans, collect intelligence, evaluate programs, and conduct operations.

Policy

A first requirement for conducting meaningful psychological operations is the national-level development and implementation of clearly articulated PSYOP policy in support of political, social, economic, or military goals. The government must establish realistic policy goals to ensure consistent and credible operations. Credibility of policy objectives is the core

element in effective psychological programs. False or inconsistent national policy can destroy the best plans and programs.

One example of a poor policy and a lack of understanding was Hitler's attitude toward the Vlasov movement in which he failed to exploit the psychological aspects of Russian Nationalism in 1943.^{15, 16} Based on policy, appropriate psychological objectives to support operations can be articulated. Programs designed to implement objectives should not be academic—they must be credible and an integral part of the operational environment. For example, if the psychological objective is to induce enemy defection atld/or surrender, appropriate actions must be taken by military commanders to ensure that friendly forces clearly understand the surrender policy, will honor safe-conduct leaflets, and will establish appropriate policy concerning the good treatment of enemy prisoners in POW camps. In an insurgency or political environment, the government must develop and implement a credible amnesty policy regarding the insurgents and their supporters.

In the United States, the development and implementation of psychological policy is the responsibility of the executive branch of government. The National Security Council, Department of State (DOS), USIA, and other appropriate departments and agencies form a joint working group or task force to develop psychological policy for an international crisis, event, or a US overseas program. This is an ad hoc group, and policy is determined by consensus.

In peacetime, the US ambassador is responsible for implementing PSYOP policy overseas. In the case of Vietnam, policy was directed from Washington to the US Embassy in Saigon. It was implemented by the Joint United States Public Affairs Office (JUSPAO). More than 60 policy guidance directives were issued by JUSPAO on such diverse topics as 'The Use of Prisoners of War in PSYOP Output,' 'PSYOP Support of Pacification,' and 'PSYOP Aspects of the Refugee Program.' US officials made every effort to develop and promulgate policy directives in conjunction with the Vietnamese government, but such coordination was the exception rather than the rule.

Planning

By definition, a psychological operation is the planned and programmed use of communication media and/or other actions to influence emotions, attitudes, and behaviors of selected target audiences. Planning is the key to psychological operations (random and isolated actions cannot produce consistent results). Planning is essential for psychological operations at all levels-from the strategic and long-range national plan to the PSYOP annex for tactical operations at the battalion command level.

When implemented, the plan becomes the basic instrument and authority for the conduct of psychological operations. One key element in conducting a psychological offensive is the integration of all available assets and their concentration on significant objectives and target groups based on the reality of military, political, or economic operations. The PSYOP plan is the crucial ingredient for integrated and concerted operations. Generally, psychological plans should consist of (1) concept of operations, (2) definition of target groups, (3) clear definition of objectives, (4) general thematic guidance for each objective, (5) injunctions or prohibitions in respect to themes, (6) timetable or schedule to ensure staged and fully orchestrated multimedia operations, and (7) definitive instructions for PSYOP units and assets.

Currently within the US government, there is no central mechanism for the planning of psychological operations. The USIA issues program guidances to its overseas services and divisions. In turn, the United States Information Service (USIS) (overseas) develops country plans which are annual information/cultural programs tailored for a particular country. The Department of Defense (DOD) is responsible for developing psychological plans in support of military contingency operations. Military plans are informally coordinated with the DOS, USIA, and other appropriate agencies.

United States PSYOP planning during the Vietnam period was the primary responsibility of the US Embassy, Saigon. In JUSPAO, the Office of Plans, Policy, and Research was responsible for those plans relating to political, economic, and social programs as well as Republic of Vietnam psychological

operations in support of Chieu Hoi (open arms), pacification, and other programs.¹⁷ On the other hand, the US Military Assistance Command, Vietnam (MACV, developed and implemented plans in support of military operations and selected programs directed to target groups in North Vietnam. Generally, PSYOP plans were coordinated with the Republic of Vietnam through its Ministry of Information and/or the Vietnamese Joint Military Command.

Intelligence

Intelligence is the basis for understanding communications, emotions, attitudes, and behaviors of individuals and groups. Y. Tanaka has proposed a three-step strategy of cross-cultural communication that involves quantitative and qualitative analyses of attitude components within a target population, systematic use of a multichannel and multistep flow of communication, and a strategy in which communication is by deed and words.¹⁸ It is significant that the first step in his strategy is the collection of PSYOP intelligence-the one critical step that is often neglected by the political or military planner.

There are three basic requirements for collecting, collating, and analyzing PSYOP data. First, it is essential that managers and media personnel have a thorough understanding of the psychological aspects of the target audience. Anyone engaged in communication and propaganda programs must have certain information about the audience-background, literacy, preferred languages and dialects, art forms and symbols, and key emotional symbols. In addition, PSYOP personnel should have a thorough understanding of the social, political, religious, economic, and military attitudes that are prevalent in significant population groups. With such knowledge, communication programs can be developed to restructure hostile or negative attitudes, reinforce friendly or favorable attitudes, or reinforce /change neutral attitudes, when appropriate.

The second requirement is for timely and systematic operational feedback. Specifically, information is needed regarding the effort being made to support PSYOP objectives, tasks, and themes aimed at definitive target groups. These

data are essential for analyzing the success or failure of PSYOP programs and strategy.

The third requirement is for timely and systematic feedback from the target audience when a PSYOP campaign is in progress—a substantial task when the full range of communication media is used. A careful and candid analysis is necessary in order to determine which messages and channels of communication worked well and why, what the mistakes were, and what can be done to avoid future errors and failures.

In 1966, a senior foreign service officer of the USIA listed a number of factors that were inhibiting the effectiveness and measurement of PSYOP programs in Vietnam.

1. We "fly by the seat of our pants" both in setting goals and measuring our success.

2. Our assessment is superficial because we are not experts and because reporting requirements tend to emphasize deeds and statistics and not attitude, opinion, and behavior change.

3. USIA is oriented more to media than to audience.

4. We deal too frequently with accidents rather than essences, which leads to confusion of ends and means.

5. There is a basic lack of research data.

6. We attempt to change rationally attitudes that are basically emotional.

7. We are often confused by changing goals in the field versus our long-range basic mandate.

8. We lack orientation toward communications as a whole and communications research in particular.

9. There is a communications gap between Washington and the field, between media product and field need. ¹⁹

Weaknesses in measuring the effect of USIA programs were stated by another senior officer.

1. The system is too simple in theory and too unclear in practice.

2. Our objectives are very broad, our specific knowledge very narrow. While we can never have all the knowledge we need, we can narrow the gap in some respects.

3. Much basic data on which to base evaluations is missing; e.g., the extent to which messages are directed to

target audiences, whether the messages are received, and whether they are understood.

4. There is at present too little operational research directed at the question of results.

5. Too much evaluation is being done by operators themselves. The evaluation is therefore subjective.

6. In the rush of day-to-day business, the hard questions are often postponed indefinitely.²⁰

No single government agency is responsible for the systematic collection of PSYOP intelligence. The Office of Research in the USIA sponsors ad hoc research and conducts some overseas field surveys in order to evaluate selected media output. Intelligence specialists in the Bureau of Intelligence and Research (Department of State) are primarily interested in political information. In a similar vein, the Defense Intelligence Agency is principally interested in the collection and analysis of "hard" military intelligence such as order of battle and weapon systems data. US Army PSYOP intelligence teams generally do not possess the resources or the scope of knowledge required to evaluate the psychological environment of potential target groups around the world.

In Vietnam, as during the Korean War, an attempt was made to overcome PSYOP deficiencies in intelligence by sponsoring ad hoc studies and surveys. However, PSYOP intelligence requirements do not lend themselves to ad hoc or temporary measures: The problem is operational, it is dynamic, and it requires constant attention by professionals who are a permanent part of the team.

A computer-oriented system is being developed by the US military to correct some of the inadequacies in PSYOP intelligence, especially in appraising the success or failure of propaganda programs. This system, known as the PSYOP Automated Management Information System (PAMIS), will be discussed in subsequent sections of this essay.

Operations

Within the US government, the USIA is responsible for educational, cultural, and informational programs and

operations overseas. Its operations in Washington (for overseas audiences) include a broadcast service (primarily the "Voice of America"); information center services that support overseas exhibits and information centers; a motion picture and television service that prepares films and audio tapes for release overseas; and a press and publication service that prepares and distributes magazines and other printed matter to overseas posts. Most of USIA's day-to-day operations are the responsibility of the USIS,²¹ which is a part of the US overseas mission. The organization and activities of the USIS are dependent on various protocols and agreements between Washington and the host nation.

The US military services have their own PSYOP units and, when authorized by the president, can support USIA operations overseas. Military PSYOP units are composed of various teams that can be put together to accomplish specific missions and functions. US Army PSYOP responsibilities include propaganda development, audio visual production, research and analysis, graphics production, printing, radio operations from mobile studios and transmitters, and loudspeaker operations.

In Vietnam, US military PSYOP favored an organizational arrangement that heavily involved the USIA. JUSPAO was established in Saigon in May 1965, a result of the National Security Council directive. JUSPAO was a PSYOP command supported by USIA, DOD, and USAID (US Agency for International Development). The director of JUSPAO (minister/councillor to the ambassador) issued policy directives (to both military and civilian agencies) and conducted the full range of strategic and tactical operations. At its peak JUSPAO was composed of about 250 US officers, more than half from USIA, and about 600 Vietnamese employees. Within the staff of MAC V was the Psychological Operations Directorate, a separate staff section that was later put under the operations chief, the J-3. The military also had operational control of a large PSYOP field unit-the Fourth PSYOP Group. Additional support was available from the Seventh PSYOP Group, which was located on the island of Okinawa.

Programs and Operations

While it is true that Vietnam represented the largest post-World War II American venture into psychological operations, the magnitude and breadth of the US effort there makes Southeast Asia an atypical example of American communications programs-even if a rich source of perspectives.

The major continuing US effort in this field is that of USIA, including the VOA.²² Through periods of attention to and neglect of military PSYOP, USIA has been the principal²³ channel of American communications to foreign audiences.²⁴ The USIA was significantly affected by the detente in US-Soviet relations; for example, its once- anticommunist rhetoric has become anachronistic. Its other functions in information dissemination and cultural exchange have withstood the passage of time far better. This is hardly surprising, since persuasive communications have marginal value as opinion changers but are much more effective in attitude reinforcement.²⁵

Pre-Vietnam

Specific efforts mounted by US psychological operations before Vietnam include, most prominently, campaigns in Lebanon (1958,²⁶ 1962²⁷) and the Dominican Republic (1965²⁸), and American efforts concerning Africa also grew after about 1960. Throughout the entire period, "Radio Free Europe,"²⁹ "Radio Liberty,"³⁰ "Radio in the American Sector" (Berlin),³¹ and other propaganda outlets were directed toward the USSR and Soviet-dominated areas.

The evolution of the postwar world left the United States, notwithstanding its early history and national values, in the position of the world's most important status quo power.³² American international communications were therefore generally antirevolutionary, frequently supporting unpopular regimes in the name of stability.³³ In some cases (e.g., Lebanon) the programs were reasonably effective, but psychological effort success is difficult to separate from the nature and success of the overall political or military activity.

Vietnam

The importance and priority that the North Vietnamese and Vietcong (VC) put on psychological operations are well known, as in the slogans "Political activities are more important than military activities," and "Fighting is less important than propaganda." Vo Nguyen Giap in his *People's War, People's Army* quotes as one of Ho Chi Minh's cardinal principles of political warfare, "Do not attempt to overthrow the enemy but try to win over and make use of him."

As noted above, in 1965 JUSPAO was established to coordinate the US policies and personnel involved in psychological operations. A major portion of the new US PSYOP effort was to be devoted to the Chieu Hoi returnee program (an attempt to win over and make use of the VC). There was to be optimum coordination and integration of both US and Vietnamese operations at all levels, with overall supervision from JUSPAO and the Republic of Vietnam Ministry of Information (MOI) through the Vietnam Information Services vested in a combined US-Vietnamese coordinating committee at the national level with representation from MACV, JUSPAO, General Political Warfare Directorate (GPWD), and MOI.

"Guidelines to Chieu Hoi Psychological Operations: The Chieu Hoi Inducement Program" was prepared in April 1966 by JUSPAO. It centralized policy planning and decentralized operational planning. Execution was assigned to the local level. Development and mass production of PSYOP materials were done by JUSPAO in accordance with tactical needs determined by the field. In addition to JUSPAO, MACV (the 4th US Army PSYOP Group) operated an extensive program, much of which was devoted to the Chieu Hoi inducement program.^{34, 35}

Content of PSYOP material, targeted on the potential rallier, was focused on his grievances, emotions, and aspirations-not on ideological commitment (except in the case of hard-core VC). The insurgent was encouraged to return to his home by the creation of trust in the government as just and generous. Former insurgents were used in preparation of the material to the maximum extent possible-they, rather than the Americans, knew the *modus operandi* of the enemy and were a part of the indigenous culture.

The leaflet-distributed from aircraft and by hand-proved to be the most practical means of disseminating the Chieu Hoi message. The ubiquitous "safe conduct pass," which literally blanketed South Vietnam, was probably the most effective message. Though there were thousands of other leaflets stressing many other themes,³⁶ the safe conduct pass was most often described by ralliers during interrogation as the one most seen and the one most conducive to rallying. After one battle, 90 percent of those VC who could be searched-the dead, wounded, and captured-had the safe conduct leaflet.³⁷ By the spring of 1971, JUSPAO had distributed nearly four billion leaflets in the campaign to persuade "men to rally to the GVN [Government of the Republic of Vietnam] under its amnesty program."³⁸

No discussion of the factors motivating defection is complete without mention of the carefully structured program of rewards given to those who rallied and indeed even to those who influenced a VC to rally. The Chieu Hoi weapons reward program paid a returnee for weapons he turned in or for weapons that he was able to recover after he rallied. This program was successful in locating large weapons caches. The weapons reward system was established by official decree of the Chieu Hoi Ministry of the GVN.

The Vietcong military forces neutralized through the Chieu Hoi program were equal to about one-fifth of the total of all their forces killed or captured by military action. More than 4,000 men from the government of the Republic of Vietnam or its allies would have been required to effect the same result through military action.³⁹

Besides the safe conduct leaflet and rewards program, testimonials from Hoi Chanh (former VC) proved to be effective in the total psychological process of attitude change. It was determined that the Hoi Chanh testimonial should contain four essential elements: a photograph and complete individual description of the Hoi Chanh; an indication of why he rallied; discussion of the good treatment he received; and an appeal to his former comrades to rally. Experience in the field showed that when a PSYOP person wrote a testimonial message for a Hoi Chanh, it was usually recognized as propaganda. The best approach was for the Hoi Chanh to address his message

specifically to his former unit and address some of his former comrades by name. He should tell enough about himself to convince the recipients of the message that he is in fact alive and well. The operative word in all Hoi Chanh testimonials was credibility. Themes were suggested to the returnee, but the language was his own. In many instances, audio tapes were prepared of Hoi Chanh testimonials for broadcast by air-to-ground loudspeaker systems and radio.

Poetry, music, and art were effective PSYOP media directed to hostile as well as friendly target groups. The messages were emotional in tone and concerned such time-tested themes as love, family, religion, home, holidays, and national heroes.⁴⁰

It became apparent as a result of operational experience that direct psychological operations, aimed at modifying attitudes and behavior, must be preceded by propaganda that is indirect in character, slow and general in nature. It should seek to create an atmosphere of favorable preliminary attitudes. No direct psychological operations can be effective without a proper foundation. Safe conduct passes and testimonials are one type of foundation; that is, they inform the enemy soldier that if and when he decides to surrender, certain protocol will be observed. The best psychological operations involve face-to-face persuasion. The following example of PSYOP messages being reinforced by face-to-face persuasion was provided by a former deputy leader of a VC surgical team who was also a Communist party member.

The Chieu Hoi leaflets were dropped by airplanes very often. I read some of them . . . At that time I didn't really believe in the leaflets because I was told by the cadres that the government wanted to cheat Front people by its Chieu Hoi program. Although I didn't believe what the leaflets said, I had something in my mind about leaving the Front. When my friend, Mr. Thiet, came to tell me about the government's treatment toward the ralliers, I believed him. I believed that I wouldn't be beaten up by the GVN as the cadres had said, because my friend was one of the ralliers, and he wasn't beaten up or punched down into the sea. [This refers to VC claims that GVN troops took the Hoi Chanh up in a helicopter and then threw them into the ocean.] On the contrary, he was well-treated by the government. He was given a job, and he was free to visit his family when he wanted.⁴¹

Another type of foundation used in an insurgency environment was a magazine disseminated in Vietnam called *Long Me*.

The primary target audience for the magazine was the families, friends, and sympathizers of the VC. The 62-page, full-color magazine was distributed bimonthly to villages and districts known to be sympathetic to the VC. It was distributed by priests, merchants, school teachers, bus drivers, fortune tellers, armed propaganda teams, and others. Long *Me* was also distributed through direct mail. It contained feature stories, poems, short novels, cartoons, and art. The feature stories were factual, and they emphasized the positive features of the new life offered to former VC. Long *Me's* indirect approach worked well. The staff of Long *Me*, with the exception of one American (Philip Katz), was composed of former communist propagandists.

Not all propagandists in Vietnam believed in the slow and indirect approach. Many messages were harsh, explicit, and direct; for example, this leaflet was prepared and disseminated by an American military unit:

The sky soldiers of the US 173d Airborne Brigade are here to destroy you. We have killed hundreds of your comrades with our powerful bombs and artillery and invincible ground troops. You will die a senseless death and be buried in an unmarked grave in an unknown jungle. Rally now before it is too late.

Propaganda must be continuous and lasting-continuous in that it must not leave any gaps in logic and continuity of themes, lasting in that it must function over a period of time. The principle of repetition plays an important role in persuasive communication.

PSYOP is not magic; effective communication is based on slow and constant impregnation. PSYOP is not a stimulus that disappears quickly; it consists of successive messages and actions aimed at various emotions or thoughts through many instruments of communication. Effective psychological actions should be continuous; as soon as the effect of one message is weakened, it should be reinforced by another.

Post-Vietnam

After the conflict in Southeast Asia, the United States once again moved away from systematic, coordinated psychological operations on a government-wide scale. As in the past, military

human resources for PSYOP were reassigned or neglected. The USIA had no intensive focus, and USIA efforts were only marginally coordinated with other US persuasion programs. The lessons of the past concerning the potential value of PSYOP, the importance of coordinated, systematic planning, and the value of continuous communications as facilitator (even during periods of strategic security) were once again ignored.⁴²

Effectiveness

Probably the most elusive single area in the analysis of psychological operations is the evaluation of PSYOP effectiveness. How can effectiveness be measured? Polling dominates much of our political life, and market research is considered fundamental to sound business practices; yet PSYOP operates in an anachronistic world where direct audience analysis is often impossible.

Effectiveness of persuasive communications is generally viewed in terms of the degree to which attitudes are changed or reinforced. However, studies have conclusively demonstrated that PSYOP directed at denied or hostile areas should aspire to modify peripheral attitudes only, not fundamental ones.⁴³ Our government's persuasive communications to foreign audiences enjoy very limited parameters of only potential effect.⁴⁴

The relatively small range of impact and the difficulty of measurement are primary constraints in the evaluation of effectiveness. The fundamental question is, how successful are the communications in terms of the limited objectives? Sometimes, however, practitioners have been forced into a secondary question: Assuming the general principles we have identified to be optimum, to what degree are the communications congruent with them?

Another major impediment to effectiveness assessment is the nonpersuasive nature of psychological operations. One is inclined to think in terms of the critical message directed at the critical audience at the critical moment. In fact, the vast majority of propaganda and other instruments of PSYOP consist of what L. John Martin has called facilitative com-

munication (*not* persuasive communication).⁴⁵ That is, PSYOP is designed to keep the lines open-maintain the channel and its credibility-in *preparation* for the critical movement, message, and audience. Since the purpose of the messages sent in facilitative communication is *not* persuasive, how do we measure their effectiveness? To what extent should the two types of communication, which are purposively related but conceptually discrete, be evaluated by a single measure?

If we could select our audience on the basis of certain idiocratic factors-objective physical and personal characteristics peculiar to an individual, such as age, sex, race, education-we might increase by a statistically significant fraction the proportion of those influenced by a message. But we would have no control over such factors as personality and susceptibility to persuasion, existing values, beliefs and opinions or attitudes toward the objects, subjects and situations involved in the persuasive message. We can choose our communicator but not determine his image. We can select the vehicle of transmission but not the channel of reception of the target of our communication. We could maximize the effect of all these factors for a single individual, especially if we were able to subject him to intensive precommunication analysis. But there is no way that this can be done for the diverse assortment of individuals who normally make up the audience of the mass media, the vehicles most commonly used in international propaganda.⁴⁶

For lack of a criterion,⁴⁷ as well as for the inability to secure direct access to the audience and the recognition of the inherent limits of persuasive communications, the most common evaluations of effectiveness have been output measures, despite their notorious limitations.⁴⁸ A second approach has been to focus on reception, in general, this area has not attracted much attention. The final type of analysis-effects measures-may be both direct and indirect.

Direct measures of effects can involve the use of polling or survey data. In peacetime, such information can be gathered in interviews with traveling foreign nationals,⁴⁹ direct mail questionnaires, and polling in the audience's country. In war, or when relations between the sender (source) and receiver (audience) countries are strained, only some-or none-of these may be practicable. In these cases, refugees⁵⁰ and prisoners of war⁵¹ have been used to gather effects data. However, such groups often have inherent disadvantages as a population-they may not be a representative sample, and

identification of the role of any individual message in their decision to defect is usually elusive.

Indirect measures include the content analysis of intercepted mail, mail drops,⁵² captured documents, broadcasts and telecasts, and target area public media.⁵³

Trends

In an effort to institutionalize PSYOP intelligence, the US military designed and developed a computer-oriented system called PAMIS. This information system was designed to fulfill several objectives: (1) to provide the spectrum of information needed to support PSYOP organizational elements for the planning, implementation, and evaluation of PSYOP programs; (2) to encourage (indeed, to enforce) methodologies to support information-gathering programs; and (3) to provide an appropriate automatic data-processing system for the storage, analysis, and utilization of the gathered data.

PAMIS encompasses these three systems:

Foreign Media Analysis (FMA) System,⁵⁴
 PSYOP Foreign Area Data System (PFAD),⁵⁵ and
 PSYOP Effects Analysis System (PEAS).⁵⁶

The primary objective of FMA is to provide statistical data obtained from publications and radio broadcasts of selected foreign countries. The data collected includes information about their propaganda objectives and strategy; propaganda themes used to support these objectives; propaganda trends; the tone and intensity of media coverage related to domestic themes, foreign governments, international organizations or political movements; and propaganda techniques and tactics. Another FMA objective is to provide clear-text abstracts on important events, subjects, and persons as they are treated in the public media of the selected countries.

The objective of PFAD is to provide the US military PSYOP community with uniform methods and procedures for the collection, storage, and rapid retrieval of data needed for planning and operations. The PFAD was designed to accomplish the following tasks:

- define parameters for the collection of PSYOP-relevant data;
- provide uniform procedures and methods for collecting and reporting such data;
- provide a retrieval system that has a centralized data bank, the core of which is a set of over 1,600 foreign area data descriptors, and that permits retrieval of two types of reports: annotated bibliographic material and narrative summaries of subject data; and
- provide for continuous and rapid updating of PSYOP foreign area information.

The computer system provides the PSYOP community with social, cultural, economic, political, communication, and other information that is needed to make decisions on aspects of PSYOP policy, planning, allocation, and deployment of resources and operations.

PEAS was designed to collect, store, and process data from a sample of a target audience in order to measure the success or failure of PSYOP messages and programs. The system also stores and processes data about friendly and hostile PSYOP activities and actions. Timely, accurate reporting on the purpose (objectives and tasks) of friendly PSYOP programs is essential, as are facts about the distribution and intensity of efforts expended on specific target audiences. Although hostile PSYOP activities and actions usually do not directly affect friendly messages, systematic monitoring of hostile propaganda and other actions provides analysts with many clues about how enemy elites react to our PSYOP programs. In fact, when respondents from the target population (such as prisoners, defectors, and refugees) are not available, the content analysis of hostile media can be the most valuable source of feedback concerning the impact of friendly programs.

A significant objective of PEAS is to institutionalize methods and procedures for analyzing PSYOP programs and strategies so that the successes and failures of strategic and tactical programs can be measured. PEAS was therefore designed to provide the following:

- **uniform (institutionalized) procedures and methods for reporting and describing all PSYOP activities in a theater of operations;**
- **rapid retrieval of command and control data to determine how effort and cost relate to objectives and tasks;**
- **the data necessary for analysts to correlate operational data with specific military target groups and segments of the civilian population;**
- **data for a continuous evaluation of the initial impact of PSYOP messages (audio and print) directed to general or particular target groups;**
- **uniform procedures and methods for reporting and analyzing hostile propaganda and action directed to friendly military and civilian populations; and**
- **data needed for an independent audit and assessment of military PSYOP by the joint or other appropriate command.**

To accomplish the above, PEAS was designed to accept, store, and process data inputs into three computer files.

The ACTH file of PEAS was designed to institutionalize the reporting of military psychological activities at each command level. This reporting system provides commanders with systematically collected data for command and control of the full range of PSYOP activities. Specifically, the ACTIV file provides information about the quantity of effort being directed in support of specific programs or campaigns, in support of PSYOP objectives, tasks, and themes, and toward definitive target groups. In addition, this file provides information about the amount of effort allocated to each channel of communication (such as print, radio, and loudspeaker). Also available is information about psychological actions such as show of force, exploitation of new weapons, and supply drops.

Much basic data is needed for making evaluations: To what extent are our messages directed to specific target audiences? What are our objectives? Are our messages received and understood? PEAS will provide many answers to these questions.

The IMPACT file of PEAS was designed to institutionalize the collection of data about the effect of specified propaganda messages, activities, and programs. The data collection format

was designed to be manageable for prisoner of war or other interrogations at any level of command. Each IMPACT computer record pertains to a respondent's (such as POW) reaction to an electronic or printed message or action. In the first step (of the interrogation process), the respondent is required to select from a catalogue of PSYOP messages that he has seen or heard. The IMPACT data record is then completed for those messages identified by the respondent.

It is beyond the scope of this essay to present the details for the multitude of inputs and outputs of the ACTIV file of PEAS, but both quantitative (statistical) and qualitative (textual) reports are available to analysts and other users of the system. These reports provide gross information related to four indicators of PSYOP impact.

- **Understanding:** Did the audience understand the language and symbolism used in the message?

- **Credibility:** Was the content credible, or did the audience view the message as obvious propaganda?

- **Influence:** Did the message influence the respondent to act in a way favorable to the sponsor of the message?

- **Irritation:** Did the language, symbolism, or other aspect of the message irritate the audience?

Statistical analysis of such data should reveal the specific themes and messages that were successful; it should also reveal those messages that failed. In addition, PEAS should provide analysts with a generous number of textual responses, in the respondent's own words, that explain the reasons for both success and failure.

PEAS will provide military commanders with the range of information needed to evaluate the impact of psychological operations. No longer will number of leaflets produced or hours of broadcast time be the only-or even the basic-criteria for evaluating PSYOP programs.

The POLWAR file of PEAS provides uniform procedures and methods for reporting and analyzing hostile propaganda and action directed to US military-and other friendly-populations. Data from this file allow for the continuous monitoring of hostile POLWAR activities at the tactical command level. It is this file of the PEAS that interfaces with the FMA system. The

POLWAR file is concerned with those communications, propaganda, and actions that take place in a combat environment and are directed at friendly military and civilian audiences. This contrasts with the **FMA** system, which is concerned primarily with strategic objectives and which deals with data obtained from newspapers, magazines, and radio broadcasts directed to their own domestic audiences.

Conclusions

Tanaka's concept of cross-cultural communication, noted above, emphasized the systematic use of multichannel, multistep flow* of communication, and a strategy in which communication is by both deed and word.

Propaganda must be total. A modern psychological operation must utilize all of the technical means at its disposal—the press, radio, TV, movies, posters, meetings, and face-to-face persuasion. There is no psychological operation when meetings and lectures are sporadic, a few slogans are splashed on walls, radio and television presentations are uncoordinated, and news articles are random. Each communication medium has its own particular mode of influence—alone, it cannot attack individuals, break down their resistance, or make their decisions for them. A film does not play on the same motives, does not produce the same feelings, does not provoke the same reactions as a leaflet. The very fact that the effectiveness of each medium is limited to one particular area clearly shows the necessity of complementing it with other media. A word spoken on the radio is not the same as the identical word spoken in private conversation or in a public speech. Nor does a word appearing in print produce the same effect as the same word when it is spoken. To draw the individual into the net of persuasion, each technique must be utilized in its own specific way, directed toward producing the optimum effect, and orchestrated with all the other media. Each medium reaches the individual in a specific fashion and makes him react anew to the same theme—in the same direction, but differently. Thus, no part of the intellectual or emotional personality is left alone.

Effective totalitarian regimes have a clear understanding of the psychological aspects of military actions. These regimes

employ propaganda for psychological impact every day, and propaganda is fully institutionalized within the political and military structure of these states. Furthermore, these regimes are sensitive to the psychological environment of their target audiences and are able to orchestrate the various instruments of communication to promote unity in their own ranks and unity with their own people while promoting divisiveness in enemy forces.

As a democracy, the United States has tried to renounce domestic propaganda; as a nation in a highly competitive political world, America must use psychological operations. As yet, however, the formula that would support both these aims without their working at cross-purposes has not been found—a fact made quite evident by the awkwardness that characterizes US PSYOP efforts at home and abroad.

Psychological operations can be among the most suitable and effective weapons in pursuit of US national objectives in this unstable and sometimes threatening world. PSYOP exploits military readiness already required for other purposes without requiring the use of military force. It draws power from the strength of Western democracy and the universals of civilization. It can encourage masses of people to develop untapped natural resources and to oppose totalitarian regimes.

The requirements for effective psychological operations are considerable. Modern persuasive communication is not a haphazard, hit-or-miss activity but a well-coordinated, sustained effort. It demands a broad and thorough knowledge of a wide variety of psychological, sociological, and cultural factors. It also requires planning well in advance of events. It must, at all times, serve under an appropriate form of centralized direction with trained personnel and dedicated resources. Contemporary psychological operations is not an amateur's game.

Notes

1. This definition is adapted from Joint Pub 1-02, *Department of Defense Dictionary of Military and Associated Terms*, 1974. *Psychological operations* is a broader term than *psychological warfare* in that it deals with friendly and neutral, as well as hostile, audiences.

2. See R. J. Barret, "PSYOP: What Is It?" *Military Review* 42 (1972): 57-72. For an excellent study of the dynamics of international perception, see Robert A. Jervis, *Perception and Misperception in International Politics* (Princeton, N.J.: Princeton University Press, 1976).

3. Harold D. Lasswell, "The Structure and Function of Communication in Society," in L. Bryson, ed., *The Communication of Ideas* (New York: Harper and Row, 1948).

4. Indeed, the four principal figures in the establishment of communications research-the fundamental PSYOP root-were two psychologists (Paul Lazarsfeld and Carl Horland), a sociologist (Kurt Lewin), and a political scientist (Harold Lasswell).

PART III

Strategic, Tactical,
and Operational PSYOP

Introduction

This section deals with the objectives and activities of strategic, tactical, operational, and other types of PSYOP. In all forms, PSYOP primarily supports the attainment of national policy and objectives. The key to all US PSYOP is credibility of the message. Evaluation is based on changing perceptions, attitudes, and behaviors.

Certainly, the ideology of a government plays a role in its PSYOP methodology and its international communications. The authors offer articles about Soviet PSYOP campaigns and activities with a credibility/ disinformation perspective.

DeWitt S. Copp discusses Soviet active propaganda measures, including forgery, agents of influence, and disinformation. His discussion serves as a historical summary of Soviet campaigns and ideology.

James Melnich emphasizes mirror imaging in Soviet propaganda. His essay is useful in understanding the overall Soviet PSYOP threat and possible related weaknesses.

Lev Yudovich reveals the significant threat and impact of the Soviet military doctrine of cultivating hate in their soldiers. This doctrine was designed to make Soviet soldiers psychologically prepared to act in dangerous situations and to believe in victory.

Dr Joseph S. Gordon focuses on research, target analysis, pretesting and effects analysis, and propaganda analysis. He concludes that intelligence activities are critical to PSYOP.

George V. Allen, former director of USIA, states that we must be realists and understand that a combination of political, economic, psychological, and military efforts are necessary. He believes that propaganda alone in the short run can do little to solve problems. Allen advocates an honest, objective, and truthful information program that faithfully relies on the individual to make right decisions.

Lt Col John Ozaki, USA, addresses the planning and coordination of successful defector programs as another form of combat power. He emphasizes the characteristics and techniques of a sound program to defeat insurgency movements.

Ronald D. McLaurin emphasizes that PSYOP at the tactical level can contribute to the major strategic objectives of a government and a reacquisition of the loyalty and support of the population.

Benjamin F. Findley, Jr., reviews and analyzes selected US and Vietcong PSYOP in the Vietnam War.

Soviet Active Measures

DeWitt S. Copp

Although Vladimir I. Lenin did not coin the term *active measures* (*laktivnee meropriyatia*), he originated and set in motion all its component parts. Those parts included the International Department (ID) of the Central Committee of the Communist Party of the Soviet Union (CPSU), Section A of the first chief directorate of the KGB, and the propaganda department (PD) of the Central Committee.

The ID is the coordinating center for Soviet active measures. Its lineage can be traced directly to Lenin's formation of the Comintern in 1919. Lenin's purpose for the Comintern, or Third International, was to advance the cause of global revolution by forming communist parties in noncommunist countries and creating conditions for revolt through propaganda and agitation. The approach was adaptable to political realities.

The International Department, formed in 1957, was a sophisticated apparatus at the summit of Soviet power. It carried the view of the leadership, bringing influence to bear on any area-political, military, or economic-that would aid or abet Soviet policy. At the same time, it sought to denigrate and undermine the policies of the noncommunist world, particularly those of the United States. More politically realistic than its Leninist ancestor, the ID's purpose was to manipulate public opinion and gain the acceptance of Soviet ends. The ID's secretary was Anatolii F. Dobrynin, who had served as Soviet ambassador to the United States for 24 years. He was appointed to his post by Soviet General Secretary Mikhail S. Gorbachev in June 1986, several months after the important Twenty-Seventh Congress of the CPSU.

The ID worked closely with the propaganda department, headed by Party Secretary Aleksander N. Yakovlev, who had served for 10 years as Soviet ambassador to Canada.

The propaganda department employed dual courses of action. It orchestrated the line of the party, utilizing Soviet and bloc media, and overtly replayed disinformation generated by the active measures apparatus. Since the PD embodied the former international information department of the Central Committee of the CPSU, it covered both the Soviet home front and the foreign scene.

One of Lenin's first acts on seizing power was to establish the Cheka, dr secret police. He knew that without such an instrument of fear, his movement could not expect to survive. That circumstance did not change, but the Cheka became the KGB-and its activities were worldwide!

Section A of the KGB's first chief directorate worked in liaison with the ID in carrying out covert Soviet active measures. These efforts included disinformation operations, the placement of forgeries, and the managing and directing of knowing and unknowing agents of influence-professionals in sensitive positions, both private and public-whose activities were frequently of great value in the Politburo's plan to gain acceptance of its position on major issues.

Together, the ID, the KGB, and the PD were the architects and planners of Soviet active measures. With an estimated annual budget of \$4 billion, their combined efforts were a major force in the mechanics of Soviet foreign policy.

Stanislav Levchenko, a former major in the KGB, was acting director of line PR of the Soviet active measures group in Tokyo when he defected to the United States in 1979. In his 13-14 July 1982 testimony at the Hearings before the Permanent Select Committee on Intelligence, House of Representatives, he gave the following appraisal.

The size of the overt and covert active measures is massive ... I can tell you from an insider's vantage point that the ID and the KGB receive all the resources and personnel needed to carry out this massive effort. There are never any shortages. Of course, this is not a recent development. An examination of the history of the CPSU will demonstrate the importance of such tactics . . . all active measures operations are assessed against a set of standards. Success is a vital

ingredient. The growth of the Soviet active measures effort over the last five to ten years is due to progress in the field.

Forgeries

Soviet active measures were carried out within a spectrum of white (overt), gray (semicovert), and black (covert) operations. It was in this last area that the crafting and placement of forgeries was conducted by section A of the first chief directorate of KGB. KGB's management of forgeries was global, and was linked to the use of Soviet assets in whatever locale the particular forgery was to be surfaced. The KGB's purpose in placing forgeries was to undermine US relations with allies and nonaligned governments and to influence public opinion against US policies concerning sensitive issues. An additional purpose was to convince those affected by the impact of the forgery that decisions announced by the United States cannot be believed because underlying them were secret plans that were harmful in their implication and intent.

For example, an obscure French-language weekly newspaper in Madagascar-Carrefour (Crossroads)-carried on its front page (summer 1985) a purported letter from a US Army medical doctor at Walter Reed Research Institute written to a supposed superior at the Pentagon. The substance of the forgery indicated that US and South African scientists were secretly working on psychotropic chemical weapons and so-called ethnic weapons that would kill only black-skinned people.

The forgery contained numerous technical errors, and its falsity was quickly exposed by the United States Information Agency (USIA). However, this did not stop Tass (the Soviet official news agency) at year's end from running the forgery as a true account. Tass lifted it from Krasnaya Zvezda (Red Star), the official publication of the Soviet Ministry of Defense, under the headline "Sinister Plans."

The purpose of the forgery was to instill and spread the belief that the US government is vicious, racist, and scientifically willing to pursue inhuman ends. That KGB effort to arouse black Africa failed-the forgery was not picked up by other African newspapers and outlets. However, one of the basic

consistencies of the active measures apparatus was that of repetition. A lie once told is never discarded, no matter how thoroughly exposed. In June 1987, in a meeting with USIA Director Charles Wick, who was in Moscow for the opening of a USIA cultural exhibit, the director of Novosti repeated the ethnic weapon lie. Wick walked out of the meeting. Novosti, a supposedly independent Soviet news agency, is heavily staffed by the KGB.

The KGB made a practice of attacking US scientific and medical activities on a broad scale, employing not only forgeries but also disinformation by clandestine radio stations. One such KGB effort was mounted through "Radio Halgan," operated by a communist-front group of Somali dissidents in Addis Ababa, Ethiopia. The station reported that the president of Somalia was negotiating with the US commander of Central Command to lease Somali territory near the border of Kenya to bury US nuclear waste in exchange for a large aid program (\$400 million). This completely false broadcast was quickly reported (as straight news) by newspapers in Kenya as well as by the AP and other wire services, which replayed the message as far away as Rome and Vienna.

In spite of US proof that no such meeting ever took place (the president of Somalia was out of the country at the time) and the fact that the US does not bury nuclear waste anywhere outside its own borders, the account took on a distorted life of its own. The false story, which was reprinted in numerous publications throughout Africa, produced this headline: "Africa a Global Dustbin for Nuclear Waste."

Soviet active measures operations, using forgery and disinformation, ran the gamut from clumsy and crude to sophisticated and clever. One example of the latter bore the unique distinction of being a double forgery.

The point of attack was Cyprus. The intent was twofold: to damage US-Greek Cypriot relations and to instill fear in the minds of the European public regarding US and NATO plans.

The KGB target was the Greek Cypriot newspaper *Simerini*. A document came into its possession, supposedly forwarded by a Cypriot official who, in turn, had purportedly received it from a British MP, Sir Frederic Bennett. His letter to an unnamed official was a forgery: "Your Excellency, I have received a letter

which contained [sic] information about your country. Since I am not an expert on the problem of the area in which your country is located, I have decided to write to you and enclose the attached letter." The attached letter appeared on the front page of *Simerini*. It, too, was a forgery. Its author was supposedly the US Air Force vice chief of staff, who was allegedly writing to US Secretary of Defense Caspar W. Weinberger, on an urgent matter. The matter concerned the US use of bases in northern Cyprus under Turkish occupation for intended operations in the Middle East. Also, and most importantly, it concerned the evacuation of US soldiers and their families and other US citizens in case of nuclear war in Europe. The forgery elaborated on the deployment of US nuclear weapons in Europe and their possible use in support of the president's strategic schemes.

Swift action on the part of USIA P/G, USIS Nicosia, and Sir Bennett exposed the double forgery for what it was. Its publication and *Simerini's* failure to write a retraction undoubtedly had a very negative effect upon Greek Cypriots who accepted the forgery as valid, but it did not gain European press attention.

To the KGB, a forgery's failure to attain the full effect in no way impeded the continuing attack. Was the forgery's purpose to convince Latin Americans that the US was plotting with Chile to inject Chilean troops and weapons into Central America? Was the purpose to disrupt the first legitimate elections in Guatemala in 30 years by indicating US manipulation and control of the election's outcome? Was its purpose to sway the Indian public into believing that the CIA was responsible for the assassination of Prime Minister Indira Gandhi? Or was its purpose to "get away with" the murder of 269 KAL passengers by claiming that the civilian airliner was on an espionage mission?

Perhaps the forgery's purpose was all of these; in any event, the work of Section A of the KGB's first chief directorate continued without letup. Its endeavors apparently were not moderated in any form by the new spirit of Geneva or by glasnost.

Agents of Influence

Of all Soviet active measures, the most effective and the most difficult to expose was the KGB's utilization of agents of influence. Agents of influence were individuals who, either knowingly or unknowingly, sought to implant Soviet policy positions into decisions made by international organizations (such as the UN) and governmental departments. They also sought to influence congressional actions, public beliefs, and national attitudes concerning world affairs. A case in point is the former senior Norwegian government official, Arne Trehold, who frequently represented his government in negotiations with the Soviets. In June 1985, Trehold was convicted of espionage; he had been a known KGB agent of influence from 1974 to 1983.

Obviously, exposing such agents was a difficult task. At times, there were 700 Soviet diplomats assigned to West European posts. Additionally, 570 Soviets were attached to UN organizations in Europe and 1,200 Soviet bloc diplomats were serving overtly in similar capacities. Finally, and perhaps of greatest significance, there were more than 200 Soviet journalists in Western Europe. The CIA estimated that at least one-third of the nearly 2,500 Soviet and Soviet bloc diplomats and representatives (trade and commercial) were either KGB or GRU (Soviet military) agents.

An unknown percentage were engaged in political espionage, enlisting and utilizing agents of influence. Through the testimony of Soviet and bloc defectors, who were previously involved in active measures, we know that journalistic cover was a KGB priority. It gave the agent an opportunity to legitimately meet a wide range of potential contacts.

Such a person may have been an unwitting agent, a dupe of KGB subtle persuasion and psychological manipulation. Not infrequently, that person was also a journalist. Caught on the hook of his own ego by a KGB operative, who appeared to be anything but, the unwitting agent was slowly and gently played through flattery and praise. He was given a chance to contribute an article to a select group of Soviet intellectuals, after which more articles were accepted and he received payment. Inside information was exchanged for inside

information until the unwitting agent began writing or broadcasting information that favored a particular Soviet line. The line could be political, military, scientific-anything that contributed to influence. In some cases the end result was blackmail, in others it was not. In all cases, however, the KGB's aim was served. There were no figures on agents of influence-only the knowledge that they were in our midst.

The term communications warfare sums up the totality of Soviet active measures-the use of words as weapons in all forms of media. Participants in this strategy were Soviet international fronts: propaganda organizations that conducted their activities under the semicovert direction and control of the ID. Lenin referred to the concept of fronts-groups that denied their Soviet connection while pushing the Soviet line-as transmission belts. Soviet fronts were in the vanguard of preaching, publishing, and fostering Moscow's aims.

Soviet International Fronts

The Soviets had 13 major international fronts and numerous smaller offshoots and satellites. Together they formed an interlocking network that specialized in advancing the Soviet propaganda line within noncommunist countries and the UN, and in emphasizing peace and disarmament as viewed from the Kremlin.

Months before General Secretary Gorbachev accepted President Reagan's invitation to meet in Geneva in November 1985, the fronts had received their marching orders from the ID. Meeting in Helsinki in April of that year, the leader of the 13 fronts drafted plans to launch an all-out campaign against the strategic defense initiative (SDI). The Helsinki gathering was hosted by Romesh Chandra, President of the World Peace Council (WPC, the largest and best known of the Soviet fronts). Chandra was also a member of the Politburo of the Indian Communist Party. Several weeks prior to the conference, the WPC had launched a global appeal against Washington's "space madness," proclaiming "No!" to Star Wars.

After that, the Soviet campaign to attack SDI and generate fear about it was unceasing. Through their publications, demonstrations, and forums, the fronts churned out a stream

of disinformation on SDI-never pointing out, of course, that SDI is a nonnuclear system whose purpose is to destroy missiles, not people.

A broad-gauged view of the campaign occurred in Prague in July 1985 when the Christian Peace Conference (CPC) held its sixth All-Christian Peace Assembly. The CPC had been a Soviet international front since its formation in Prague in 1958; its purpose was to encourage noncommunist clergymen and their congregations to support Soviet policy, including the invasion of Afghanistan. Nearly 800 participants from 97 countries attended the assembly. At the weeklong sessions, staged to address the social and economic ills of the world, a single message overrode all else: SDI meant the militarization of space. SDI was the promotion of an aggressive policy, a web of deception. SDI was a frightening expression of human hubris.

The Soviet propaganda efforts did not succeed in changing President Reagan's strategic policy at the Geneva Summit or, nearly a year later, at Reykjavik. This lack of success, however, did not halt the ongoing Soviet effort against SDI.

Soviet international fronts never admitted defeat on any issue, and they claimed victory in President Carter's 1977 decision to forego stockpiling the neutron bomb in NATO arsenals. In following ID instructions, their emphasis could shift from the neutron bomb to INF, to chemical-biological warfare (CBW), to SDI. All Soviet policy issues played continuing roles in the fronts' propaganda.

To conceal the obviousness of their real purpose, some fronts (such as the WPC), formed additional fronts and satellites. The Vienna-based International Institute for Peace (IIP) is one example; its hierarchy was made up of high-ranking officers of the WPC. The IIP sought to attract noncommunist academics and professionals who were willing to accept the false notion that the institute was a place where scientists from East and West could frankly exchange research results on all aspects of the peace issue.

Another WPC offspring was the International Liaison Forum of Peace Forces (ILF), which was formed at WPC headquarters in Helsinki in 1973. Like the IIP, the ILF was heavily staffed by WPC officers. The ILF held a series of dialogues on peace

issues; for example, opposing SDI and NATO's INF deployment. Mostly, these conferences were held in Vienna, their WPC connection carefully obscured. The ILF was turned on and off as the Soviet International Department required.

Another Soviet front that was created through WPC organizational efforts was Generals for Peace and Disarmament (GPD). Its membership comprised 13 retired senior NATO officers. Foremost among them was Italian Gen Nino Pasti, who had once served as NATO deputy commander. He and four of his fellow members were closely associated with the WPC. Unlike other Soviet fronts, the GPD held no conferences on its own. Some of its members either attended, or sent frequent statements of support to, the major front peace congresses. The members also wrote books and pamphlets that attacked NATO policies and that tacitly-sometimes vigorously-supported the Soviet line. Based in London and chaired by retired Brig Michael Harbottle, the GPD was found by the British Foreign Office to have collective views that were contrary to those of the British government and its allies. Brigadier Harbottle and some others did a considerable amount of traveling, seeking media interviews and public forums from which to speak against allied military strategy. Harbottle took credit for arranging four meetings with retired Warsaw Pact generals in which there was unanimous agreement that the United States was a threat to world peace.

The propaganda drive of the Soviet fronts for 1986 was a coordinated campaign to dominate the UN-proclaimed International Year of Peace (IYP). As nongovernmental organizations (NGO) were granted consultative status with UN economic and social departments and agencies, the fronts positioned themselves to lead the IYP celebration. (The IYP chairman, Viacheslav A. Ustinov, was under secretary general for UN political and security council affairs.)

In all, there were more than 800 NGOs, only seven of which were Soviet-directed fronts. Yet, when the 250-member Conference on Non-Governmental Organizations (CONGO) elected a 20-member board to direct operations, five of the board members were representatives of the seven Soviet fronts. In January 1986, the CONGO met again in Geneva to hold conferences under the slogan "Together for Peace." Of the

18-member executive committee chosen to organize and direct the congress, six of the delegates were representatives of Soviet international fronts-and the WPC was separately selected to coordinate CONGO activities with the UN governing body.

Throughout 1986, these particular fronts, calling themselves closely cooperating NGOs, preached the Soviet propaganda line on disarmament and peace. They collectively moved toward a climactic assembly held in October 1986 in Copenhagen under the rubric of a World Peace Congress. An attempt was made to indicate that the congress organizers had been drawn from a broad political spectrum. Such was not the case, however: The WPC-at roughly three-year intervals-was the planner, organizer, and director. The last world peace congress was held in Prague in 1983. The WPC sought to conceal its role in the Copenhagen Congress, but Denmark's Social Democratic Party (SDP) exposed it and declared that this widely heralded peace gathering was nothing more than a Soviet front operation. The Danish press reported accordingly. This exposure did not stop the event, but the SDP spokesman issued this statement: "The members of the Congress Preparatory Committee do not represent a broad selection of political affiliations. We have checked the names of the people on the organizing committee and the vast majority are Communist."

Nevertheless, some 2,000 delegates and peace activists from around the world assembled to attack US policies, support the Soviet Union, and damn SDI. It seemed appropriate that the five-day peace congress ended in a wild melee when protesters against Soviet human rights violations attempted to make their point. After that, the Soviet international fronts were less vocal and more restrained, and Soviet propaganda was promulgated more directly by Soviet entities; for example, the Soviet Friendship Society.

The Gorbachev Era

When President Reagan met with General Secretary Gorbachev in Geneva in 1985, their views of disarmament revealed major differences. There was one area, however, in which all

participants at the summit appeared to be in agreement: the need to have a greater degree of cultural and personal exchange and a lesser degree of suspicion, animosity, and cold-war propaganda.

Perhaps it was a new beginning. The media proclaimed it the spirit of Geneva; Gorbachev called it glasnost (openness). It does not appear, however, that this spirit trickled down to the purveyors of Soviet active measures. Consider, for example, the following:

- The Tass disinformation report on US scientists developing ethnic weapons to be used against South African blacks was repeated as 'recently as June 1987.

- Post-Geneva Soviet and surrogate propaganda implied that the CIA was behind the assassination of Swedish Prime Minister Olof Palme.

- Post-Geneva Tass claimed that the US Air Force had bombed Honduran peasants with poisonous substances at night. (The charge was completely refuted by Honduran health officials.)

- Lies emanating from Moscow and carried by Soviet surrogates (e.g., the New Delhi *Patriot*) maintained that the CIA was involved in the assassination of Prime Minister Indira Gandhi, the Air India crash, and rebellion among the Sikhs.

- The Soviet press alleged that the United States continued to create biological warfare weapons when, in fact, the United States was in full compliance with the 1972 treaty that banned the production of biological and toxic weapons.

- Soviet sources alleged that the CIA perpetrated the 1978 Jonestown massacre in Guyana (a US congressman and 918 cult members were killed). The story appeared first in *Izvestiya* on 30 January 1987 and again in the Leningrad Komsomol (communist youth organization) newspaper on 10 April 1987. A particularly gruesome account, containing photographs from Jonestown, appeared in the 2-8 March issue of *Nedelya*, a Sunday supplement of *Izvestiya*. Soviet media accounts were based on the book, *The Murder of Jonestown A CIA Crime*, published by a Soviet Ministry of Justice publishing house.

The Soviet AIDS Campaign

A recent campaign on acquired immunodeficiency syndrome (AIDS) provides insight into the methods used by the Soviets to spread a totally false story; that is, that the AIDS virus was scientifically engineered in a US laboratory at Fort Detrick, Maryland, and released into the mainstream by criminals and homosexuals who had volunteered to be guinea pigs. In October 1985, *Literaturnaya Gazeta*, attempted to launch such a campaign through the New Delhi *Patriot*, but there was only sporadic pickup by the foreign press. In May 1986, the *Litgaz* newspaper of the Soviet writer's union tried again; again, there was little outside response.

During these scattered Soviet attempts to sell the idea that AIDS was a made-in-the-USA product, US Ambassador Arthur Hartman wrote letters of protest to the editors of the publications involved, but the letters were not published. The ambassador later made the letters public, pointing out that the accusations were false and that the scientific claims were ridiculous.

The Harare Nonaligned Summit (NAM) became the launch pad for another Soviet-directed AIDS disinformation campaign that was to have far more success than the previous attempts to sell the lie. For several months prior to the NAM, Soviet and pro-Soviet media had claimed that the US government (CIA) was out to wreck the NAM, but no mention was made of the US being responsible for AIDS.

The opening attack came just prior to the summit with articles in the *Harare Sunday Mail* and the *United News of India*, reporting the distribution of a scientific tract to the delegates titled *AIDS U.S. Homemade Evil, Not Made in Africa*. (Its actual title was *AIDS-Its Nature and Its Origin*, but it sought to sell the aforementioned thesis.) The false claims of the document failed to take hold at the conference, due in part to a swift retraction by the *Harare Sunday Mail*, which carried an interview with an American virologist on the faculty of the University of Zimbabwe. The virologist found the document to be totally without scientific merit.

There was no further mention of AIDS until Novosti, the Soviet news agency, reported from Moscow that two French

scientists had confirmed that AIDS was the result of bacterial warfare testing in the United States. That same day in Damascus, *Al Thawra* ran the Novosti account on its front page. Two days later, "Radio Prague" broadcast the same story in its English language Afro-Asian service program. Tass then repeated the disinformation that AIDS had been developed at Pentagon laboratories at Fort Detrick, Maryland. This story was also reported in Kampala in the leftist magazine *Weekly Topic*.

Later, the London *Sunday Express*, certainly no part of the Soviet active measures apparatus, ran an interview story with Professor Jgcob Segal and his wife, Lilli, principal authors of the Harare Summit AIDS document. The *Express* reported that Segal, and to a lesser degree his specialist colleagues (Dr John Seale of London and Dr Robert Strecker of Glendale), contended that the killer AIDS virus was artificially created by American scientists during laboratory experiments which went disastrously wrong and that a massive cover-up has kept the secret from the world until today. This totally erroneous front-page claim had the effect the Soviets sought. Coming from London in a conservative publication, the disinformation caught hold.

In the week that followed, 14 USIS posts reported reprintings of the *Express* story. By end of the month, the total approached 30. Publications in Africa, Latin America, the Middle East, India, and Western Europe carried the disinformation. In Wellington, New Zealand, The *Dominion* ran the story on its front page under the heading, *Bizarre Theory on AIDS Origin*. In Helsinki, although a tabloid carried the piece, it also carried this quote from a noted Finnish AIDS expert, Dr Jukka Suni: "I know of Doctor Segal and of his reputation. He is a 'prophet of doom' who has been getting worse year after year."

In Eastern Europe, only in Poland was the *Express* article replayed. It was featured in the Polish government daily, which made a connection with the *Literaturnaya Gazeta* account of October 1985. Several days later, the Soviet press weighed in through Tass and *Pravda*. The Soviet official news agency used reports from its New York correspondent, who had cited out of context a National Academy of Science report on AIDS. Tass attempted to link factual scientific information with Segal's

Fort Detrick disinformation. Segal was again referred to inaccurately as a French scientist.

Pravda went a vicious step further, running an editorial cartoon that showed a man in medical dress handing a beaker full of swastikas suspended in liquid to a second man wearing a US military officer's uniform. The officer is handing the doctor a wad of dollars. The beaker is labeled "AIDS virus." A number of corpses lie on the floor. Ambassador Hartman again wrote letters of protest, this time to the editors of Tass and *Pravda*. As before, he received no response.

Result of USIA/State Response

Although the disinformation campaign was initially successful, rebuttals from USIA and State Department INR quickly helped to reverse original media acceptance of the Soviet effort. Adding to this was the stabilizing effect of two widely attended AIDS conferences in Brazzaville and Berlin. In Brazzaville, where representatives of 37 countries gathered under the chairmanship of Dr Johnathan Mann, AIDS director of the World Health Organization, no mention was made of the campaign. In Berlin, it was dismissed as being unworthy of comment.

As a result, many of the publications that had carried the *Sunday Express* story printed retractions (which included a modified backdown by the *Express* itself). In a stinging editorial, the *Hindustan Times* declared that not a single reputable scientific journal had supported the thesis that AIDS was man-made. Almost every Western specialist is convinced that the AIDS virus mutated naturally and spontaneously from an animal virus.

In Brazil, *O Estado de S. Paulo* observed that AIDS and *disinformatza* are very similar in their corrosive action: One infects and destroys the body while the other succeeds in shaking and disorienting the soul. There are two basic questions at the root of this Soviet active measures campaign: Where did the claim originate? Who are the scientists who have attempted to spread them?

In July 1983, the New Delhi *Patriot* published a letter from an unnamed "well-known American scientist and anthropologist

who wished to remain anonymous." The letter was a lengthy undocumented account of how the AIDS virus was developed by the CIA and the Pentagon. Fort Detrick, Maryland, was reported by the writer to be the place where the disease was created. He added just as incorrectly that a similar US laboratory in Lahore had bred super mosquitoes and other insects that could spread dangerous diseases such as yellow fever, dengue, and encephalitis. The only source the unknown writer gave for any of this information was the totally unreliable cult organization, the Church of Scientology.

Literaturnaya Gazeta used this rambling piece of gobbledygook as its source in its October 1985 story. So did the Segals in their document presented at Harare. Jacob Segal was born in Leningrad and was a longtime resident of the Soviet Union before moving to East Berlin. He is a 75-year-old retired biologist and self-announced AIDS specialist who failed to attend the mid-November Berlin conference on AIDS. He maintained that AIDS was first tied to Fort Detrick by a British researcher who published an article in a New Zealand journal. Segal's wife, Lilli, however, offered a different source-the East German Urania Press. Urania's prime function was to disseminate Soviet propaganda.

Lilli Segal is a retired researcher and professor of epidemiology. She survived Auschwitz and has been a resident of the GDR since 1953. She and her husband worked as biology instructors in Cuba for several years. Both have been retired from Humboldt University since 1983. Their AIDS thesis was absurd, according to world renowned AIDS specialists. It had no bearing on serious scientific knowledge of the virus. It was on a par with the Segals' attempt to link the surfacing of the disease in New York City with its proximity to Fort Detrick. Their report stated that criminals who had engaged in homosexual practices during the long time of their imprisonment "obviously" concentrated in the nearest big city after their release and it was therefore logical that the first AIDS cases should have been registered in New York. In fact, however, New York is 250 miles from Fort Detrick while Baltimore is only 45 miles and Washington, D.C., 50 miles from that installation. Further, President Richard M. Nixon called a halt to all offensive biological warfare experimentation

in 1969. In its place, a vaccine program was instituted at the US Army Medical Research Institute of Infectious Diseases. The laboratory's work was focused on finding vaccines against biological warfare.

Fort Detrick is not used entirely for military purposes. Of the 25 tenants on the installation, one is the Frederick Cancer Research Facility. It operates under the direction of Health and Human Services with a department devoted to AIDS research. It has never been a military component. Other research is conducted by the Department of Agriculture in both foreign and domestic crop diseases. Fort Detrick's *raison d'être* is to cure, not to inflict; to prevent, not to infect.

It should be added that neither Dr John Seale, London venereologist, nor Dr Robert Strecker, California gastroenterologist, both of whom were quoted in the Sunday Express, subscribed to the disinformation regarding Fort Detrick.

Conclusion

The twisted course of the Soviet active measures AIDS campaign can be traced back to a Soviet-aligned Indian newspaper. It quoted an unnamed individual whose line of lies took root in the Soviet press and briefly flourished via a Soviet-bloc document that was completely lacking in scientific credibility. Later, a new piece of AIDS disinformation emerged from India. It attempted to link the disease to a Union Carbide pesticide. Still later, a Communist party member in the Indian parliament sought to press the AIDS-made-in-the-US line. Nevertheless, the disinformation boomeranged on the Soviets; many publications around the globe have come to recognize and understand the nature of this Soviet active measure.

Appendix A

Weinberger Forgery

A few years ago, a forged document purporting to be a speech by US Secretary of Defense Caspar W. Weinberger surfaced in the Federal Republic of Germany. The document is dated 25 November 1983. No such speech was ever made, and Secretary Weinberger never made the remarks attributed to him. The document was a complete fabrication. Its aim was to convince Europeans that the US purpose in developing the Strategic Defense Initiative (SDI) was not only to gain US military superiority over the USSR but also to dominate its NATO allies. Both goals were supposedly to be accomplished largely by US control of space through SDI, which was described in the forgery as an offensive system.

The concepts used in the document did not reflect US government thinking, but were, in fact, what the Soviets wanted West Europeans to believe about US views. Although for the most part the forgery was written in acceptable English, several mistakes in word usage indicated that the drafter's first language was not English. For example, it asserted that the United States sought "prevalence" over the Soviet Union at all (military) levels. The forger(s) confused *prevalence* with *superiority*.

A major point made in the forgery was that the United States would suffer a disastrous depression without SDI. However, the key and distinctive error had the secretary of defense commenting that the Soviets have not been engaged in an SDI program of their own. In fact, Secretary Weinberger, the president, and other leading US defense spokesmen had pointed out repeatedly that Soviet scientists had been at work on a similar project since 1968.

The Weinberger forgery is one of several addressed in this report. All sought to undermine US policies and intentions.

Disinformation Hits Home

Soviet disinformation attempted to "hit home" with a forged letter purportedly written by Herbert Romerstein, United States Information Agency (USIA) Soviet active measures coordinator to US news organizations. The Washington Post

approached USIA with the forged letter, which Mr Romerstein had supposedly sent to Senator-Select David Durenberger (R.-Minn.), chairman of the Senate Select Committee on Intelligence. The forgery was cleverly conceived but poorly executed. Its purpose was to smear USIA by making it appear that the agency was proposing that the United States should make false claims about the Chernobyl nuclear accident.

The forgery alleged that Mr Romerstein proposed to Senator Durenberger that USIA disseminate rumors about the accident. The forgery suggested that "our associates in European information media" spread reports that would include the following details:

- the "number of victims should be alleged to be somewhere between 2,000 and 3,000";
- a "mass evacuation of population from the 100-mile zone" around Chernobyl should be alleged to have occurred; and
- "transport problems, shortage of various goods, chaos, and panic should also be given publicity."

The forgery also recommends that "our allies should be influenced so as to make a request for compensation for contamination of their territory." The document takes advantage of the insights offered by hindsight. It is backdated to 29 April 1986, the day after the Chernobyl accident was first reported by the Soviets and just before rumors (of exactly this nature) began to appear.

Had the forgery been accepted by the press, it would have given currency to the notion that rumors about Chernobyl had been generated by USIA rather than by the Soviets' refusal to release sufficient data about the events surrounding Chernobyl. At the same time, USIA would have been cast as a manipulative, rumor-mongering propaganda apparatus free to dictate to senators and unnamed "associates" in the European media.

Poor execution, however, ruined the Soviet attempt. The forgery was not composed correctly and it contained an incorrect address for Durenberger. Its falsity was easily ascertained by journalists who telephoned the USIA and Senator Durenberger's office.

Ironically, Romerstein's forged signature was taken from a letter he had previously sent to Lt Gen Robert L. Schweitzer,

head of the Inter-American Defense Board, informing General Schweitzer about a forgery purportedly written by him. Even more obvious, the word copy in Romerstein's handwriting at the top of the Chernobyl forgery is identical to a notation made on copies of the letter to General Schweitzer.

The forgery had all the hallmarks of a Soviet active measure, although its sloppiness probably indicated an operation executed by personnel in the United States rather than those in the Moscow Center, who could be expected to produce a more professional product. In analyzing forgeries, one key is to determine who benefits. Certainly, Soviet purposes would have been served if the USIA had been blamed for the bad press that was actually caused by Soviet intransigence and stonewalling over Chernobyl.

Levchenko on Dobrynin

At a USIA briefing on 20 August 1986, at Washington's Foreign Press Center, former KGB major and active measures specialist Stanislav Levchenko made some observations about Anatolii Fedorovich Dobrynin, former Soviet Ambassador to the US who later headed the Soviet Communist Party Central Committee's International Department.

Mr Dobrynin's appointment to the International Department post had been the subject of much speculation in the American press. As a former staff member of the International Department, Levchenko's perspective on this issue was instructive.

Basically, Levchenko discounted the theory that Dobrynin's appointment was "positive for the future development of healthy relations between the Soviet Union and the United States."

I dare to disagree with this point because if Mr Gorbachev really wanted him to do that kind of job, he could have made him, let's say, first deputy foreign minister in charge of bilateral relations with the United States, and he could spend all his days and nights working in that field. Instead, Anatolii Dobrynin becomes chief of the International Department, which, in another parlance, is the largest subversive mechanism in the world. The purpose of that department is not enhancement or deepening of bilateral or multilateral relations at all. It's just the contrary. It is the department which, among many other

functions, is disseminating disinformation in the interests of the politburo and running all sorts of operations in that field.

Levchenko believed that Dobrynin would reinvigorate the active measures operations of the International Department and use his knowledge of the United States to bring a new professionalism to its activities.

He, of course, knows about some flaws which the active measures machine had during the last couple of years when his predecessor, Boris Ponomarev, was really getting old. I personally have no doubt that Mr Dobrynin will try, within a rather short period of time, probably within this year, to restructure the mechanism in such a way that it will work better, on a much more professional basis, that sloppiness will probably disappear, and that the scale of operations against primarily the United States and NATO countries on a global basis will definitely be enhanced. That's my projection.

Levchenko's final assessment on Dobrynin: "He is the person who has close to perfect knowledge of the United States. He's probably one of the best specialists in the Soviet Union on the United States, who is generally considered to be a very talented, bright person who is, of course, a devoted Communist and quite a devoted person to the cause of the politburo."

National Security Council Forgery

A very well-done and ambitious forgery surfaced in Lagos, Nigeria. It bears the title, "US Strategy in Foreign Policy 1985-1988" and falsely claims to be a "copy of a summary paper on US foreign policy approved by the (United States) National Security Council (NSC) in February 1985." A section of the forgery dealing with purported US policy in Africa was published in Lagos in the weekly magazine Africa Guardian. Its broad scope and relative professionalism increase the chances that it may reappear in other areas.

The forgery was a 10-page, single-spaced document lacking any identifying symbols and classification markings. It was divided into eight topical sections dealing with US policy toward important regions. It was cleverly crafted, skillfully weaving together US policy with phony assertions that would outrage foreign as well as domestic audiences. For example, the United States was falsely portrayed as believing that "a

preemptive strike potential, together with guidance, communications and intelligence systems of high sophistication, would guarantee our security to a degree which would permit us to exert severe pressure on the Soviet Union to the point of issuing an ultimatum if necessary."

Other false assertions were that:

- The United States was seeking "the establishment of an effective first-strike (nuclear) capability by the year 1995."
- "Strategic superiority" was the goal of US policy, and advances in military technology might "suggest" or "even demand a preemptive strike."
- NATO allies should be pressured "to conform to US policies."
- The US problem with the Greek leadership was that it had an "independent attitude."
- The United States is opposed to curbs on nuclear and chemical weapons.
- In Nicaragua, "US military intervention cannot be ruled out, keeping in mind the lesson of Grenada."
- The Organization of American States "should be made to accord with our national interests."
- A negotiated settlement between Vietnam and an ASEAN bloc over Cambodia "in no way corresponds with US interests."
- Japan must agree to a stronger US military presence in that country and to increase its military strength through the purchase of US arms.
- The United States will "seek to hold China to policies corresponding with US global interests."
- The United States feels that China has an "unpredictable political future" and an "absence of stable power succession procedures."
- The United States opposes the successful implementation of China's modernization program because it "might lead to rivalry or even confrontation with the United States."
- "Nothing short of Qadhafi's assassination will bring any significant change in Libyan policies of support for international terrorism."
- Israel is referred to as "the Jerusalem government," implying recognition of Jerusalem as the capital.

- The United States is planning to use the rapid deployment force for "preemptive operations" if a "threat to our interests" arises.
- The Soviet presence in Afghanistan is seen as a "propaganda bonus" which can be utilized to increase US military and political power in the Persian Gulf region, perhaps even leading to "the restoration of American influence in Iran."
- The main lines of US policy in Africa are to exploit the area as a necessary source of raw materials and to control African affairs in conjunction with South Africa.

Many other themes and subthemes were planted in this lengthy forgery. As with the other forgeries mentioned above, this one appears to be a product of the Soviet Union or one of its surrogates. The themes cited reflect Soviet claims about US policy.

The Assassinations of Olof Palme and Indira Gandhi

If one were asked to name the major similarity between the gunning down of Swedish Prime Minister Olof Palme and the gunning down of Indian Prime Minister Indira Gandhi, the answer would be that the Soviet Union, by innuendo, falsely accused the Central Intelligence Agency (CIA) of committing both crimes and repeated the lie through its propaganda outlets.

On 31 October 1984, Prime Minister Indira Gandhi of India was assassinated by Sikh members of her bodyguard. Several hours after the murder, "Radio Moscow" declared the assassins had "received their ideological inspirations" from the CIA. "Radio Moscow" broadcast a familiar litany of disinformation, accusing the CIA of guilt in the assassination of world leaders over a 25-year period.

Pro-Soviet Indian publications were quick to pick up the Moscow line. They added their own embellishments, some directly accusing the United States of having murdered Mrs. Ghandi. These claims were replayed by the Soviet press. Responsible Indian newspapers would have none of it, however. A *Hindustan Times* editorial summed up public

reaction: "The Soviet media saw in the grim event a golden opportunity to mount cold war propaganda against the United States.... Cold War propaganda on such a tragic occasion by the Soviet Union is uncalled for and most unfortunate." President Reagan called the Soviet allegation, "the world's biggest cheap shot in a long, long time."

The Soviet lie became a double lie when Secretary of State Shultz confronted Soviet Prime Minister Tikhanov at Mrs Ghandi's funeral and Tikhanov denied that his country was making such claims. The Indian government, in a determined investigation of the assassination, found no trace of any US involvement.

These events occurred about a year before President Reagan met with General Secretary Gorbachev in Geneva and some 15 months before the murder of Swedish Prime Minister Palme. It was hoped that the Geneva meeting would bring a change in the kind of outrageous disinformation that had been spewing out of Moscow day in and day out.

Prime Minister Palme was killed on a Friday night. The next day, Tass published a commentary on Palme's death. The commentary was written by Anatoly Krasikov, deputy director of Tass. Krasikov's commentary, according to the Swedish daily *Aftenpost*, "indicated that CIA is behind the murder." This commentary employed exactly the same kind of slippery innuendo "Radio Moscow" had used in implying that the CIA was responsible for Indira Ghandi's assassination.

The next day (Sunday, 2 March), *Pravda*, the official Communist Party newspaper, added its commentary. The writer, Chingiz Aytmatov, academician of the Soviet Academy of Sciences and delegate to the 27th Congress of the CPSU, raised a basic question and then answered it. Who was, or who were, the assassin(s)? We do not yet know, but it is clear even now that the terrorist crime was committed by forces that are interested in shifting whole countries and regions to the right and in intimidating the public, which heeds the voice of an honest individual.

Response from the Swedish newspaper *Morgenbladet* was swift. In an editorial titled "Grotesque," it attacked Gorbachev's 'mouthpiece' in choosing to exploit the situation at a "tragic moment." It went on to say, "the real question is what Gorbachev

means with his fine words about detente and peace when he allows such gross propaganda. There is brutal contradiction between the hopes he has expressed for a relaxation of internal tension and his continued hammering on public opinion with anti-American propaganda."

On Monday, the New Delhi Hindi daily *Navbharat* carried a Moscow dateline report: "The official agency Tass has alleged that the assassination of Swedish Prime Minister Olof Palme was the handiwork of the CIA." Other Indian publications, particularly those that were pro-Soviet, repeated the accusation and parallels were drawn between the political viewpoints of Mrs Ghandi and Mr Palme.

In the course of the next few days, the Tass-Prauda effort was replayed in a number of locales-Ghana, Malta, Australia, Uruguay, Peru. In the latter two countries, the publications were Communist Party weeklies. In Australia, the conservative daily *Australian* concluded an account by its Moscow correspondent with a quote from former Swedish Prime Minister Falldin: "I refuse to believe it is a political assassination.... This must be the work of a lunatic."

Elsewhere around the globe, the Soviet accusation was ignored; but that was not the end of it. Seventeen days after the murder, Aytmatov, the writer of the Prauda commentary, was interviewed by the Swedish newspaper *Dagens Nyheter*. "Aytmatov was now clearly alarmed that his words would be interpreted" to suggest the CIA had committed the crime. But the Prauda writer's retraction was something less than unequivocal: "The people who murdered Olof Palme do not need to come from the United States or the CIA-even though it does seem to be the case of reactionary forces."

The Soviet academician was simply following the standard Leninist technique of hedging his Prauda commentary with obfuscation. However, just as the Soviet-oriented accusations of CIA guilt in the assassination of Indira Ghandi continued to surface, so, too, did those about Olof Palme. His name was added to the long list of assassinated leaders that Soviet disinformation organs recited on a regular basis as victims of CIA operations.

Yellow Rain Again

Certain characteristics in Soviet active measures operations followed a consistent pattern. One was to try and reverse blame for Soviet Military actions by accusing the United States and its allies of carrying out exactly the same acts. This was done not only by describing the Soviet techniques originally followed, but also by employing the same terminology; for example, *yellow rain*.

In March and November 1982, the US State Department presented to the United Nations reports of "Soviet involvement in provision and use of toxin weapons." The reports offered "information, Vvidence and an analysis of results the United States had obtained on the use of toxin and other chemical war agents by the Soviets in Afghanistan, and by the Lao and Vietnamese under Soviet supervision in Laos and Kampuchea." The victims referred to chemical agents that had been sprayed and dropped on their villages by plane, helicopter, and artillery shell as yellow rain. Between August 1983 and February 1984, further evidence of yellow rain attacks in Southeast Asia were submitted by the United States to the UN. These charges were angrily denied by the Soviets, who submitted their own scientific paper. It maintained that Agent Orange, the defoliant used by the US to clear jungle areas during the Vietnam War, had contaminated the elephant grass. Its infected spores, the Soviet government claimed, had been carried by prevailing winds into Laos and Kampuchea where they had tainted the environment and brought illness and death to those affected. Scientifically, this explanation was recognized as hogwash.

By the end of 1985, reports of yellow rain in the aforementioned areas had "diminished in number." But on 7 February 1986, yellow rain was suddenly in the news again. This time, the area was Honduras and the culprit was the US Army. The newspaper *Tiempo*, reporting from San Pedro Sula, quoted a leftist trade union publication which maintained that the US Army was spraying lethal chemicals on civilians in northern municipalities for experimental purposes. The chemicals, it reported, caused fainting and convulsions. Further, it said that strange sores appeared on the bodies of

children. The report said that the affected communities had requested investigations by health authorities.

In the first published accounts of the reported problem, no mention was made of yellow rain. On 22 February, Tass quoted *Red Star*, the official Soviet Ministry of Defense newspaper: "The United States is carrying out criminal experiments with chemical weapons in Honduras. . . . U.S. aircraft have been scattering yellow toxin in the air similar in its characteristics to the highly toxin 'Agent Orange.' . . . Eyewitnesses to the secret flights by the US aircraft say that 'yellow rain' falls every time the aircraft appear."

That same day, "Radio Moscow" offered a commentary, repeating the same accusations and using the same terms. But the accusation went even further. The commentator said the Pentagon was preparing to launch chemical and biological warfare against Nicaragua and was responsible for an epidemic of dengue that had hit that country earlier. Some of these charges were picked up by the Panamanian press, which added that the yellow rain story had been born of a theory "between groups of the Honduran Left."

Previously, the US Embassy in Tegucigalpa had denied that US forces were testing chemical weapons anywhere in Honduras, "least of all against the civilian population." Not only had a US medical team investigated the charges, but so had the US military and a Honduran congressional group. Under the heading "Congressmen find downpour of calamities instead of yellow rain," the newspaper *La Prensa*, along with other Honduran publications, including *Tiempo* (which had broken the original story), cited the cause of the problem as an epidemic of mange stimulated by a lack of hygiene; the germ had spread through physical contact.

The daily *El Haraldo* carried an interview with Honduran Army Chief of Staff General Humberto Regalado Hernandez, who said that a military investigation coincided with state and private reports. The disease, he said, had been known since biblical times as scabies and was not the result of chemical gases dropped from unidentified aircraft on evening flights. The only flying in the area had been done by Honduran crop dusters who were spraying sugar cane.

The general added that he believed the purpose of the stories was to discredit US military detachments that were training in Honduras. Another possibility, he said, "is that the USSR, via Cuba and Nicaragua, is using sophisticated methods.... The presence of `yellow rain' in our homeland was ruled out, but there is evidence that the local fifth column is carrying out disinformation campaigns ordered by the Soviet connection in Tegucigalpa." This Soviet yellow rain story was turned off by the combined actions of the Honduran government and the press.

What Soviet PSFOP Mirror Imaging Can Tell Us

James Melnich

Soviet psyoperators were sometimes ignorant of significant nuances concerning the societies they targeted for propaganda development. Though time and experience tended to improve certain technical aspects of Soviet PSYOP, Soviet psyoperators sometimes continued to reach down into their own limited Soviet experiences for examples and themes that they projected onto the Western societies they were attacking in their propaganda. Study of this mirror-imaging process can be very revealing and may point out important weaknesses. This is true even though some segments of the Soviet PSYOP hierarchy appeared to have gained in sophistication. Identifying some of these tell-tale characteristics will help us to assess the overall Soviet PSYOP threat.

Glasnost, Gorbachev, and Disinformation

The campaign of glasnost in the Soviet Union under Mikhail S. Gorbachev, with its emphasis on a more open Soviet press, by no means signaled an end to Soviet disinformation. On the contrary, since the press in the USSR began writing on many topics previously considered taboo, there were more opportunities for mirror-imaging disinformation to present itself—perhaps with some new twists.

For example, we can examine one of Gorbachev's perceptual blunders concerning the United States and see how it relates to the concept of mirror imaging. In early 1987, Gorbachev met with several US congressmen in Moscow. In the course of their discussions, he suggested that America create separate states for blacks, Puerto Ricans, and citizens of Polish background.¹ Apart from this being a ludicrous and insulting

recommendation, it provides some insights into the Soviet system. To begin with, it demonstrates Gorbachev's ignorance of the internal policies of the United States. Further, it assumes that we have a Polish problem that must be dealt with. From the standpoint of mirror imaging, it suggests that the Soviets dealt with many of their minority problems by sending minorities to autonomous regions somewhere in the Soviet Union.

The Soviets had serious minority problems, especially with their Central Asian Muslims. There have been riots in Kazakhstan, demonstrations in the Baltic states, demands by Crimean Tatars for their rights, and pressures for greater Jewish emigration. Demographic analysis of the Soviet population suggests that the Great Russian nationality itself was becoming a minority in its own country as Central Asian birthrates skyrocketed.

As Soviet policymakers sought answers to these problems, Soviet propagandists were producing disinformation about an alleged Western ethnic bomb supposedly targeted against US minorities. This propaganda is an excellent example of mirror imaging. What some in the Soviet Union undoubtedly wished they themselves had, they projected as a policy practiced by their ideological enemy. This disinformation example shows us both the Soviet propagandists' intense prejudice and how limited their worldview really was. It is an example that is repeated over and over in a variety of contexts, whether one is considering AIDS, baby parts, or chemical weapons.

One might add that, although the Soviet Union did have its share of extremely sophisticated propagandists, such as Georgii Arbatov of the Institute of the USA and Canada, Politburo member Aleksandr Yakovlev, and Vladimir Posner of Radio Moscow, the fact that Gorbachev himself could make such an error should tell us something about the attitudes of rank-and-file Soviet propagandists.

Ultimate Enemy Projections

Soviet propaganda was rife with allusions to the ultimate enemy, whether that enemy be world imperialism, Nazi storm troopers, supporters of SDI, Zionism, or religious activists in

the Soviet Union. The ultimate enemy was usually portrayed as being antihuman and opposed to everything the Soviet Union stood for. For example, Zionism was defined as a "deadly enemy of the Soviet State from its very beginning."² There was usually a plurality of Soviet ultimate enemies, depending on the international situation. An ultimate enemy in Soviet propaganda was first dehumanized, then made part of an anti-Soviet worldwide conspiratorial network (i.e., Afghan freedom fighters became bandits fighting as agents of US imperialism; unofficial religious groups in the Soviet Union were linked with dark forces from abroad).

In attempting to describe the ultimate enemy, whoever and whatever that might have been at a given time, Soviet propagandists sometimes drew from actual Soviet acts of barbarism. Thus their disinformation, as a form of mirror imaging, reflected back into the pool of Soviet reality. For one example, I will draw from personal experience.

In the early 1980s, I met a Soviet emigre woman who was convinced that evangelical Christians in the Ukraine sacrificed babies by rolling them in barrels with spikes as part of some religious ritual. She, of course, had never witnessed such a thing, but said that she had heard about those people when she lived in the Soviet Union. Obviously, she was the victim of very gross Soviet disinformation-and there were other Soviet campaigns in which other religious groups were under attack by the state. One can find numerous articles accusing Soviet Baptists of drowning children or performing other dark and perfidious acts-the whole purpose being to defame the targeted group and further isolate them from the general population.

Nevertheless, the matter of the spikes continued to bother me: why such a particular disinformation image? Where did it come from? Did a propagandist simply make it up out of thin air, or did it spring from some other source? I have no final answer to this question, but a year or so later, when I was reading Michael Voslensky's work, *Nomenklatura: The Soviet Ruling Class*, a particular passage leapt out at me. Voslensky, in quoting a 1920s account about the Cheka (the earliest forerunner of the KGB), recounted various Cheka methods of torture and execution of their victims. One such method was

reported this way: "at Voronezh they put their victims naked in barrels spiked on the inside and rolled them."³ This account and recent Soviet disinformation against religious groups are separated by more than one-half century. Are they somehow related, or did later Soviet propagandists simply make up the recent vicious accusation out of thin air? One cannot be certain, of course, but I would posit this as a possible example of a mirror image projected out of the past.

Zionism and Nazism

In examining the concept of ultimate enemy in Soviet propaganda, we might also consider Soviet disinformation that compared and linked Zionists with Nazis. One would be hard-pressed to find a more vicious lie, but such comparisons fit Soviet concepts of the ultimate enemy very well. They also furthered Soviet foreign policy goals in the Middle East. Virulent anti-Semitism was imbedded in Soviet society, along with fears of a Jewish conspiracy dating back to the fraudulent Protocols of the Elders of Zion. There was also the memory of Nazi fascism, which cost 20 million Soviet lives during World War II and the fear that German revanchism would once again rear its ugly head. Soviet propagandists simply combined the two images.

What this tells us is that the Soviet propaganda machine (regardless of its short-term goals for the propaganda, such as defaming Israel in third world countries) was itself convinced that there were many real enemies, both within and outside the Soviet Union.⁴ These were then reduced to extremely crude and violent images and made a part of an ongoing international conspiracy. They probably also believed that such ultimate enemy projections were both necessary and useful for their own population. While many societies resort to ultimate enemy projections and stereotypes in propaganda during wartime, the Soviet Union appears to have been one of the few nations to do it consistently over time during periods of peace.

As a footnote, one might consider how sensitive the Soviets themselves were to being stereotyped in the West. The TV series "Amerika" showed the Soviets as adversaries, but adversaries possessing many human characteristics—a far cry

from the ultimate enemy. Yet the program was denounced in almost apocalyptic terms by Soviet spokesmen-and threats were made prior to its airing. Soviet propagandists continued to show daily hatred against the West on a massive worldwide scale, with only an occasional protest from the West when the results of a given lie would have had serious and undeniable consequences.

The Invasion of Grenada

In late 1983, the Soviet newspaper *Izvestiya* not only attacked the United States for invading Grenada but also accused US forces (allegedly quoting the Mexican newspaper *El Dia*) of using chemical weapons to poison some 2,000 Grenadens, including women and children, and of recording their suffering and deaths on film. This gruesome fabrication, which was read by millions of Soviet citizens, further stated that the bodies were shipped back to the United States for additional study. The author of that article was A. Kuvshinnikov.⁵

For a long time I tried to discover who A. Kuvshinnikov was or is, or whether it was a pseudonym. Then another article by A. Kuvshinnikov appeared in *Izvestiya* on 21 August 1987. This article was said to be from the US correspondent at the USSR Foreign Ministry Press Centers. It is likely that these articles were written by the same person. In his especially pernicious article about Grenada, Kuvshinnikov attempted to set up a parallel between the WWII Nazi death camps with their human experiments and the US invasion of Grenada. This is another example of the ultimate-enemy image. No citation was given for *El Dia*, which was described by *Izvestiya* as an influential Mexican newspaper.

Soviet propagandists apparently believed that their audience would accept such base lies to some extent. And were these articles also designed to mitigate the effect of certain Soviet actions? In my opinion, they may tell us in part what the Soviets themselves have done or are capable of doing. The horrors of Afghanistan, as recounted by refugee survivors of Soviet atrocities, come to mind. Were the consciences of some Soviet veterans returning from Afghanistan (who may have

participated in brutal crimes against civilians) eased when they thought the United States had done worse?

Mirror imaging in Soviet propaganda is, I believe, an analysis area of great value to all who study the former Soviet Union—especially those who seek to understand the nature and depth of Soviet PSYOP.

Indoctrination of Hate

Lev Yudovich

Soviet military doctrine required the soldier to develop a strong feeling of hatred. This hatred was cultivated so the soldier would (1) believe in victory, (2) be willing to act in a dangerous situation, and (3) be psychologically prepared to operate under the conditions of modern war.

In case of war, the Soviet soldier will face a strong and brutal enemy who has been well indoctrinated in a spirit of irreconcilability toward the Soviet people. The Soviet soldier must therefore have a clearly defined attitude for the enemy: hate, contempt, and a feeling of superiority over them. We must show the soldier the strong and weak points of our enemies. We have to define the enemy in terms of his psychological characteristics (or stereotypes) that are related to his nationality or ethnic group.¹

The Soviet soldier was constantly being indoctrinated to develop hatred for the West. The indoctrination of hate started with the myth of a US threat to the Soviet Union. This myth allowed Soviet political and military leaders to keep the entire country in a state of tension and stress. The myth also made it easier to justify military spending and the consequent lowering of standards in domestic life. The American threat to the Soviet Union was the fundamental thesis of Soviet propaganda.

The aim of Soviet propaganda was to create a stereotyped pattern of thinking and reacting. The myth helped Soviet military and political leadership instill prejudice in the soldier. He was trained to become suspicious of foreigners and their way of life. His suspicion and deep distrust became the basis for hate. According to the Soviet view, "the political myth is an

This article provided courtesy of the US John F. Kennedy Special Warfare Center and School, Fort Bragg, North Carolina. Part of an original work titled, *An Assessment of the Vulnerability of the Soviet Soldier*.

ideological tool of the imperialists and a tool for psychological manipulation of the masses" (Col Gen D. Volkogonov). Thus the Soviet authorities use the very same technique that they accuse the enemy of employing.

The Soviets instilled hatred for the United States even in peacetime. They justified this approach by explaining that, in the past, the final moral hardening of the soldier could be achieved during the course of combat. In the future war, however, there will not be enough time for psychological preparedness. The soldier must, therefore, be prepared through training. He must put aside any moral convictions he might have and be oriented only toward accomplishing his mission.

Hate produces excitement and excitement can overcome the soldier's fear. To develop hatred, political workers used a wide variety of indoctrination methods (e.g., discussions in small groups, lectures, and political reviews) and every form of media. Deception, falsification, discreditation of Western leaders, and even cartoons became methods for building up hate. The US soldier was shown as a hireling, a mercenary, and a freelance murderer with a very low moral level. He had no convictions, and his main reason for fighting was to get money. The Soviets stated that the US soldier was not reliable in Vietnam. As the military situation in Vietnam got worse, said the Soviets, there were more deserters, and racial tensions increased. The reason they presented such distorted views was simple—to cultivate hate.

In 1952 the Military Publishing House of the Ministry of Defense of the USSR published a book written by Col Polkovnik B. W. Karpovich titled *The Ideological Indoctrination of Soldiers in the Armies of the United States and Great Britain*. This book was aimed at military readers. The author pictured American soldiers as fascists and animals.² When a young man enters the US Army, he stated, all training is aimed at turning him into a skilled murderer.³ American officers encourage US soldiers to be murderers and rapists. In the Korean War, according to the colonel, all American soldiers raped Korean women and girls, and officers created special brothels in which Korean women were forced against their will to provide sexual services for the soldiers.⁴ American soldiers,

he said, far exceed the Nazis in their gangsterism, brutality, and greed.⁵

Although those statements were made around 1952, this method of describing American soldiers persisted. Despite détente, indoctrination of hate continued. In 1986, for example, the Main Political Administration ordered the use of a film, "Hate the Imperialists,"⁶ and a 1968 article, "The Psychology of Murder and Torture," which purported to picture the American soldier.⁷ Political workers indoctrinated hate during every major maneuver from Dnepr to Shield '84.⁸ One dramatic example of such indoctrination utilized the site of Nazi victims' mass graves. Veterans and former partisans assembled for ceremonies at those sites and stated their recollections of Nazi brutalities. The political workers pointed out that imperialists had produced these atrocities and had also committed acts of brutality in oppressing national liberation movements that developed in other countries. These comparisons were used to unmask the imperialistic threat of Soviet enemies-the Americans.

Political workers in the Strategic Rocket Forces used every moment of their contact with soldiers, even appealing to the soldiers while they were on combat alert duty. Soldiers on duty in underground rocket bunkers were visited by political workers.⁹

Even in the face of new political thinking aimed at reducing the mutual military threat of the Soviet Union and the United States, the Soviets continued to instill hatred for Americans in their regular indoctrination programs. For example, a Soviet military journal included an article stating that hatred should be developed because "hate is the most important quality of the soldier and sailor since it promotes vigilance and combat readiness. Our hatred for imperialist plunder has deep roots. Our class adversaries are stained with the blood of millions of Soviet people who were killed during the wars initiated by imperialist aggressors. These imperialists are responsible for the trouble and suffering of millions of people all over the world. Our right to hate the imperialists is justified by their current blood policy and their intent to invade our homeland with weapons of mass destruction."¹⁰

The Soviets were developing not only hatred but also arguments to justify it and explain to the Soviet soldier why he should hate the Americans. An important reason for hatred was to overcome the Soviet soldier's interest in the American lifestyle and any sympathy he might have for such American items as jazz, cars, and freedom to travel. Hatred was used to build up a distrust of everything foreign.

During the fifties, there was little difference between the Soviet military evaluation of the American soldier and the evaluation used in propaganda. Both evaluations were summarized by F. O. Mikchei: "American soldiers are very dynamic and have good technical skills, but they lack discipline' and have low moral qualities. They have only a narrow political mental outlook.'" In the seventies, that evaluation started to change.

The majority of Soviet military writers pointed out that, in a future war, American soldiers would be well indoctrinated for fighting the Soviet Union.¹² "The future war will be very severe because the American soldier has a very strong anticommunist view. He is aggressive and ready to carry out his officers' orders. He is ready to be exposed to reasonable risks. He is obsessed with the idea that he is a superman. However, he is a selfish person, wants to make a profit, uses drugs and alcohol, and he is inclined to desert."¹³

Although Soviet military leaders changed their assessment of the American soldier, Soviet propagandists clung to their old picture of the American military gangster-murderer. Because the good fighting quality of the American soldier was recognized, propaganda was increased. Every attempt was made to show that the American soldier was actually an object of scorn. The propagandists stressed the message that the American soldier must be thoroughly hated. Such hatred produced the Nazi holocaust.

Intelligence and Psychological Operations

Col Joseph S. Gordon, USAR

Intelligence is an inextricable element of PSYOP in all phases of its activities, from the planning and conduct of operations to the evaluation of its effectiveness. For this discussion, PSYOP intelligence includes that which is generated by a PSYOP organization's own research and analysis assets as well as the intelligence which is obtained from other agencies. The major areas of intelligence activities in support of PSYOP are research, target analysis, pretesting and effects analysis, and propaganda analysis.¹

Research

Research is geared to support the mission of PSYOP, which is to create in hostile, friendly, or neutral foreign groups the emotions, attitudes, or behavior to support the achievement of national objectives. The effective PSYOP campaign requires systematic research of the highest scholarly standards. Intelligence required for PSYOP can be divided into two categories: basic and current.

Basic PSYOP intelligence consists of general information on such topics as the history, society, politics, economy, communications media, and military forces of a given country or region. Such information is kept in files of pertinent documents and a library of area studies books. When time and resources permit, the general information is digested in the production of studies that are tailored to support PSYOP. One example is the basic PSYOP study, which supplements area studies by focusing on relevant PSYOP issues, defined as highly emotional matters, deeply rooted in a particular country's history, customs, fears, or foreign policy. The issues

are selected largely for their ability to support PSYOP objectives that are classified as either cohesive or divisive.

Cohesive issues exploited could help strengthen or more closely unite the total society or particular target group. Divisive issues exploited could contribute to the separation of a group from the greater society or to the disorganization of a people. The basic study should also provide information on national symbols, emotive music, or pertinent graphics that could be used in the development of PSYOP materials. PSYOP intelligence analysts also produce special studies in response to timely events or to the need for greater focus and depth on an aspect of a country or society not covered elsewhere.

Current intelligence is obtained from all possible sources and is used to update studies and files. Should a PSYOP campaign be implemented, it is essential that current intelligence be considered to ensure that the issues already identified still pertain and that the themes and materials developed for use in the campaign are still valid.

The sources of PSYOP intelligence are diverse. But most of the intelligence required to conduct PSYOP is generally obtained from unclassified sources: newspapers, magazines, books, academic journals, studies, and foreign broadcasts. Classified reports on pertinent subjects are distributed to PSYOP organizations. Such organizations may also request intelligence collection for specific items of factual information.

Liaison with other agencies outside the Department of Defense (DOD) often can produce valuable information. Some agencies that can assist PSYOP in obtaining information about local conditions in foreign areas include the Central Intelligence Agency (CIA), Department of State, Foreign Broadcast Information Service (FBIS), the Library of Congress, and the US Information Agency (USIA). USIA not only conducts public diplomacy, telling America's story to the world, but it also undertakes extensive foreign media analysis, audience research, and public opinion polls. Finally, human intelligence is important-especially to gather information about denied areas in both peace and war. The sources of human intelligence include emigres, refugees, and prisoners of war.

No discussion of intelligence research is complete without mentioning the qualifications of the analyst. Because PSYOP

demands extensive knowledge of the history, politics, society, economy, culture, and military affairs (to name a few) of a given area, research is usually a team effort. However, the individual analyst qualifications should include mastery of research and writing techniques, earned advanced academic degrees, considerable experience living in a foreign culture, and knowledge of languages pertinent to the region. The complete analyst should also be able to read the French and German languages, and should have as much information as possible on countries of the third world. Highly capable intelligence analysts are essential for a successful PSYOP program.

Target Analysis

The intelligence effort in target analysis can be divided into five elements, the first of which is to determine key audiences. Based on systematic research, one determines the major elements of a given society delineated by such factors as geography, ethnic origin, religion, race, economic status, and social position. Two basic criteria are used to select PSYOP targets. One must first consider the importance of the target to the PSYOP mission, then the probability that the target can be moved to support the objectives of the campaign. In other words, one asks whether the target has influence and whether it can be persuaded to use this influence in ways that would aid US national interests.

The second element of target analysis is to determine the attitudes of key audiences. Basic research provides intelligence on long-standing attitudes toward political, military, economic, and social subjects. This information is refined as much as possible to delineate the views of various age cohorts, social strata, and occupational groups.

The third element is an analysis of current vulnerabilities within specific audiences-in essence, an updating of the preceding element to determine the level of dissension, fear, or complaints at the time of the PSYOP campaign. When properly assessed in a timely manner, such fears and anxieties can be exploited as target vulnerabilities in a PSYOP program.

The fourth element is a decision regarding message content and means of communication. The vulnerabilities and attitudes of the target provide a foundation on which to build thematic materials for a PSYOP campaign. These materials must support the plans and policies of the campaign, and the vulnerabilities/attitudes they are based on must be an accurate assessment determined by scientific analysis and evaluation. Further, it is essential to determine which means of communication (e.g., radio, television, leaflets, face-to-face) are most capable of reaching the target.

The fifth element of target analysis, testing the contents and measuring the effects of a PSYOP message, is an extensive one. It requires a separate discussion.

Pretesting and Effects Analysis

The pretesting of PSYOP materials is a crucial phase of a campaign. It is good to determine in advance that the message is clear and potentially effective. It is also good to avoid the small errors, which are easily made, in idiomatic language or cultural incongruities that can immediately destroy credibility. There are several methods for pretesting PSYOP materials, many of which can also be used to analyze the effects of communication. But testing is usually highly problematic in that the targets of the campaign are generally located in denied areas. To partially compensate for this problem, prisoners of war, refugees, or other emigres from the denied area can be utilized.

The general sample survey is perhaps the best systematic method for determining the effects of media content. It can be used before, during, and after a PSYOP campaign. The survey involves asking significant questions of a relatively small sample of scientifically selected persons to ensure representativeness. This technique determines whether the message is understood, credible, evokes the desired response, or has provoked undesirable effects.

Another method of testing PSYOP material is the panel, which differs from the survey in that the panel participants are repeatedly questioned at regular intervals in the course of the campaign. There are at least two variations of this technique.

One variation involves choosing a small group of people to represent some larger population segment. The success of the representative panel is, of course, dependent on the selection process. Success also requires rather free access to the audience. The second variation attempts to compensate for the lack of access by assembling a group of knowledgeable panelists to discuss the merits of the PSYOP materials in question. The discussion panel has a weakness, however: significant views can be suppressed by peer-group criticism.

A final method of testing is the individual interview. Ideally, it should be performed by a trained psychologist. The main purpose of the individual interview is to obtain insights into the deeper meaning of events and to clarify the mechanisms by which these meanings are formed, perpetuated, and changed.

Measuring the effects of a PSYOP campaign is a most complex and frustrating task. One is reminded of the Madison Avenue executive who lamented that half of his firm's advertising was effective, but he did not know which half. The above-mentioned techniques of analysis can also be used in an attempt to determine the effects of a campaign. There are also two other indicators, the first of which is physical response to the campaign. If the audience acts as the PSYOP message suggested (e.g., to defect, surrender, or cause a disturbance), there is evidence of effectiveness. One must be aware, however, that this action could have been caused entirely or in part by other factors. The other indicator of PSYOP effectiveness is through analysis of the opposing media. By monitoring the press, radio, propaganda, and other documents and publications, one can find evidence of the opposition's response to our campaign.

Propaganda Analysis

Analysis of propaganda is most valuable for a number of purposes. Examination of the opposition's domestic propaganda—that directed at its own population—can be exploited in two ways. First, it can reveal general intelligence about the political, economic, social, and military situation in a given country (if not the possible intentions of action in a given situation).

Second, domestic propaganda in revealing such information may also disclose vulnerabilities that can be used in our PSYOP campaigns. Further analysis of external propaganda directed at our side can serve as a basis for our own counter-propaganda activities as well as a basis for our public information efforts to defend against the effects of opposition propaganda or our own population or armed forces.²

Regardless of the purpose or kind of propaganda, one focuses basically on seven questions in its analysis. What is the source? What is the objective? Who is the target? What attitudes are being exploited? What techniques are used? What media are employed? How successful is the propagandist in accomplishing the objective?

Although these analytical questions may seem rather simple, answering them can require sophisticated examination of the propaganda materials. It is not sufficient to merely deal with the themes and the logic conveyed in the propaganda message, one must pay much attention to the psychological meaning of the total package, including its symbols, use of language, and other emotional accouterments. One should be thoroughly familiar with the myriad of propaganda techniques (one author listed 77 different ones). Our counterpropaganda and public-information efforts must deal with the techniques as much as the themes of opposition propaganda if they are to be effective.

Although good intelligence is important in all military operations, it seems even more important to PSYOP. It is critical throughout the spectrum of operations from the initial planning to the campaign evaluation. PSYOP is not only a user, it is also a producer of intelligence. It is capable of contributing to the overall national effort as well as servicing its own needs.

Notes

1. A valuable source of this paper was Ronald D. McLaurin, ed., *Military Propaganda: Psychological Warfare and Operations* (New York: Praeger, 1982). Especially useful was Part IV: "Intelligence and Research," which included among other pertinent articles the following: Philip P. Katz, "Intelligence for Psychological Operations," and "Exploiting PSYOP Intelligence

Sources," 121-54. Also very useful was Department of the Army Field Manual (FM) 33-1, Psychological Operations, 1979.

2. In addition to FM 33-1 cited above, the following works were consulted for propaganda analysis: Leonard W. Doob, *Public Opinion and Propaganda* (New York: Henry Holt, 1948); D. Lincoln Harter and John Sullivan, *Propaganda Handbook* (Media, Pa.: 20th Century Publishing, 1953); and William Hummel and Keith Huntress, *The Analysis of Propaganda* (New York: William Sloane, 1949).

III. Guides to Periodicals

Book Review Digest. Useful to evaluate works consulted in research.

Public Affairs Information Service. Guide to scholarly journals such as *Foreign Affairs* and *Orbis*. A similar service is provided by the *Social Science Index*, not listed here.

Readers' Guide to Periodical Literature. Guide to articles in many popular publications such as *Time* and *Newsweek*.

IV. Military Periodicals

Air University Library. *Air University Library Index to Military Periodicals.* Maxwell AFB, Alabama.

The Military Press. *Current Military Literature.* Oxford, UK.
Valuable Service. Includes foreign language publications.
Quarterly Strategic Bibliography. Good on military affairs but also considers broader aspects of power.

V. Foreign Broadcast Information Service

Transdex Index. Guide to the FBIS Daily Reports and JPRS Translations (see below).

VI. Newspapers

The New York Times Index. Guide to newspapers. Considers itself the "Book of Record" for the US.

VII. Various

Chiefs of State and Cabinet Members of Foreign Governments.
 Updated monthly.

Current News. Pentagon clipping service of US newspapers on defense-related issues. Distributed daily in the Washington, D.C. area.

Foreign Broadcast Information Service. *Daily Report.*
 Newspaper and radio broadcasts translated into English each day.

. *JPRS Special Translations.* Translations of lengthier pieces or groups of clippings on given subjects from foreign sources.

VIII. Style Guide

College of Aerospace Doctrine, Research, and Education. *AU Press Style Guide.* Maxwell AFB, Ala.: Air University, 1994.

Turabian, Kate L. *A Manual for Writers of Term Papers, Theses, And Dissertations.* 4th ed.

What the US Information Program Cannot Do

George V. Allen

An international information program cannot change the basic attitudes and opinions in foreign countries.

One of the great American fallacies is the notion, prevalent among people in all walks of life, that we need to explain ourselves, our policies, and our way of life to foreign peoples so they will love us-or at least will understand and sympathize with our point of view. I submit, however, that this point of view is not realistic and that those in the academic world and other professionals in communications should be tough-minded enough to face certain facts squarely and realistically.

While I was director of the United States Information Agency (USIA), I was often asked by congressmen to explain why the "Voice of America" (VOA) seemed to have difficulty in getting the American story across to the people of foreign countries. It should be very simple, I was told. You need to explain that the American way of life-including our democratic principles, our respect for human rights, and our private enterprise-has produced the highest standard of living in the world. Everybody admitted that not only the upper strata but the common man in the United States had more of the good things in life-more shoes, clothes, leisure time, music, vacations, and opportunities for advancement than people of other countries. Why can't you just keep pointing that out to them on VOA?The job should be easy.

However, Uncle Sam was regarded as Mr Rich. We were presumed, with some justification, to want things to remain

Excerpts from John Boardman Whitton, ed., "What the U.S. Information Program Cannot Do," *Propaganda and the Cold War* (Washington, D.C.: Public Affairs Press, 1963). Reprinted with the permission of the Public Affairs Press, copyright holder.

more or less as they were. We talked a good deal about evolution instead of revolution, and we made it clear that we did not want the government of Cuba to seize American-owned sugar refineries or other American property without adequate and prompt compensation. We insisted on reforms (e.g., Latin America under the Alliance for Progress) but we wanted them to be instituted by orderly legal process while the miserably poor wanted to turn the world upside down overnight. They regarded the United States as basically in favor of the status quo. (All rich people are supposed to be that way.)

More significant, perhaps, is the fact that Moscow was regarded by most of the poor people around the world as the friend of the poor and of the rebel. When one asks how it is possible that so many Cubans were attracted towards Moscow rather than the United States, the painful but realistic answer is because they thought Moscow was more likely to support them than we were. Demagogues such as Fidel Castro or Juan D. Peron, who depended for their chief support on the rabble, were likely to shout defiance at Uncle Sam-and their followers were likely to cheer them for it.

The "Voice of America" could not change the basic fact that the US was rich while most people in the world were poor. The more we talked about our high standard of living, the fewer friends we had.

What is the answer? For those of us concerned with communications, we must recognize the facts of life. We must try to see ourselves as others see us. We must understand *their* motivations and reactions as we try to help them understand ours. We have put too much emphasis on explaining our point of view and not enough on understanding theirs.

Let us turn now from economic to political matters. One of the principal foreign policies of the United States has been the decision to participate in and foster collective security for the nations of the free world. The purpose of the USIA, in the words of President Eisenhower shortly after the agency was established in 1953, "shall be to submit evidence to peoples of other nations, by means of communication techniques, that the objectives and policies of the United States are in harmony with and will advance their legitimate aspirations for freedom, progress, and peace." In other words, we must make our

policies as convincing and acceptable to foreigners as we can, presuming that our policies are in harmony with their proper aspirations.

I was in India when the United States gave military aid to Pakistan under our collective security policy. The archangel Gabriel could not have made this palatable to the Indians or convinced them that it was compatible with their aspirations-legitimate or otherwise. There was no policy we could have adopted that could have convinced both sides we were their friends.

The heavy responsibilities of the United States sometimes require us to take positions that please nobody. There is danger in expecting too much of communications techniques. I was once told that only the VOA could win the Berlin disputel

There is a tendency for college professors to claim too much for the growing field of communications (sometimes improperly called psychological warfare). Many universities are rapidly developing studies, and even faculties, in this specialized field. But if those in the academic world and we in government overstate our case for communications, we are likely to make trouble for ourselves. Propaganda can do little to remove the basic problems of the have-nots, the national rivalries of Pakistan and India, or the racial animosities of Africa. And whatever communications can do will take a long time. Like education, communication is not likely to avoid takeovers in third world countries.

We must put forward an honest, objective, and truthful information program and then make it available in comprehensible terms to as many people as possible by the most effective media. Then we must rest our case with the common sense of mankind. I suppose one must have a mystic faith, as Jefferson did, in the ability of the common man to make a right decision when given adequate information and freedom of choice. If you do not have this faith, I doubt that you should be in the communications field.

Let me repeat, however, that we must be realists. Nations will be saved from aggression by a combination of forces, including political, economic, psychological, and military-the latter being possibly the most significant in our present sad state of international chaos.

Defector Operations

Lt Col John Ozaki, USA

Defector operations must be carefully planned and coordinated at all levels.

Because of the economic and political instability that prevails during internal defense operations, many insurgents can be persuaded to return to their government's cause if a sound defector plan is instituted. The successful campaign against the Huks in the Philippine Islands and the more recent Chieu Hoi (open arms) defector program in Vietnam tell us it is possible to formulate a defector program for internal defense and development. Success, of course, depends upon proper implementation.

The successful defector program requires national coordination, and it should have the objective of supporting the existing government. Specifically, that objective may be met by any of the following:

- **Inducing the maximum number of insurgents to discontinue voluntary support of the insurgent program and to support the legally constituted government.**
- **Exploiting for intelligence and psychological operations those individuals who have returned to the side of the government.**
- **Fulfilling promises to defectors by providing to them and their families security and economic support, to include vocational and job opportunities that help them become self-supporting.**

Reprinted by permission from *Military Review* 49 (Fort Leavenworth, Kans.: Army Command and General Staff College, March 1969), 71-78.

- **Enlisting the defectors for specialized jobs and units where their knowledge of the enemy's techniques can be utilized.**

To increase the chances of a successful defector program, US representatives to the host country at the national level should seek approval of the following policies, especially in cases where the United States is advising a host country on military matters:

- **The host country should' establish an agency to be responsible for execution of all aspects of the defector program, which should be equal in status to major components of the government such as the military departments and the national police. This agency's organization should function on the principle of centralized direction and decentralized execution from the national to the lowest level.**

- **US agency responsibilities and policies for defector operations must be clearly established from the national level down to receipt of a defector by a combat unit.**

- **Combined agreements should be made whereby a review of performance can be accomplished for the purpose of replacing ineffective administrators.**

- **The responsible US agency should have control of funds provided by the United States that are used in direct support of the defector program.**

- **Combined civilian and military counterparts should be established at each level where major defector operations take place. These would include district, sector, regional, and national levels as appropriate to the territorial organization of the country.**

The objective of the inducement program is to prepare the members of the insurgent forces to quit their cause and join the legitimate government. The overall effect lets the insurgents know that the government is aware of their plight and wants to forgive and welcome them back. Closely associated with this program is the requirement of informing loyal citizens and military organizations about the program. These are the groups that play an important role in the rehabilitation of the defectors. The loyal citizens must accept

the defectors back into the society or the defectors will probably return to the insurgent side.

Inducement operations are the responsibility of PSYOP personnel although intelligence organizations also play a major role in this part of the program. The intelligence community provides PSYOP personnel with information gained from interrogations designed to determine why insurgents have quit their cause. If feedback provided by intelligence is timely and valid, this information can be used to induce more insurgents to quit their cause. Intelligence organizations benefit from this type of mutual support because, with more insurgents defecting, there is the probability of increased intelligence.

Themes

Before a PSYOP program is implemented, a careful analysis is made to determine the vulnerabilities of the insurgents. Common vulnerabilities of insurgent forces are hardships, disillusionment because of slow progress, and fear of getting killed. To be effective, the term *hardship* must be translated into meaningful facts such as insufficient medical services, low pay, and long family separations. The success of any PSYOP effort depends on close coordination with intelligence agencies.

Maximum use of radio, loudspeakers, newspapers, leaflets, and other publications will be the mainstay in the dissemination link. The PSYOP operator, however, constantly seeks new and unusual techniques to spread the word of the government concerning the promises of the defector program. Innovations such as badges, postage stamps, and imprinted balloons publicize the defector program. Encouraging local government officials to speak about the program may also help.

PSYOP Utilization

Former insurgents are used to the maximum extent possible in inducement operations. They are extremely effective in developing PSYOP material because they know the environment and the modus operandi of the insurgent. If defectors are

integrated into the PSYOP effort, their knowledge of the habits, customs, and idiom of the insurgents will make the PSYOP effort more effective. Additionally, these individuals are used in evaluating PSYOP material before it is disseminated.

Small units of armed defectors are organized to perform propaganda missions in locally contested areas. Such units are effective because they speak with firsthand knowledge. For security purposes, selected individuals of known loyalty are incorporated in these special units.

An effective system of rewards is one of the most important aspects of a defector program. Rewards are coordinated to ensure that each defector is paid for the assistance he provides to the government and that the pay is equitable. A central office monitors all rewards and establishes a well-publicized standard scale to ensure that rewards are in line with those previously paid. Defectors are questioned to determine whether they have received all rewards due them.

Speed in making payment is necessary so that the impact of the deed is not lost; consequently, funds should be made available to local officials so that rewards can be paid immediately. When security permits, rewards should receive wide publicity so all can see that the government lives up to its word. This added emphasis may induce other defections, particularly when large sums of money are involved.

Exploitation of the returnees involves obtaining information, disseminating the intelligence derived from this information, and using the intelligence to defeat the enemy. The following major considerations concern the exploitation of defectors:

- Treatment promised to returnees must be delivered. Initial reception is particularly important because it has an important bearing on how much an individual will contribute to the government. A returnee who is properly treated may even volunteer for intelligence and PSYOP roles. On the other hand, an individual improperly treated becomes an easy target for reindoctrination by antigovernment forces.

- Qualified interrogators are available at the lowest level possible, which is important because of the insurgent's characteristic of frequently moving. It is imperative that defectors be interviewed within the first few hours after

defection to determine their knowledge. Interviewers also need the necessary communications to disseminate information to responsive units. When the number of qualified interrogators is limited, consideration should be given to pooling and dispatching them by air as the situation requires.

- Security must be provided for both the defector and the defector's family. Insurgent forces are likely to place maximum effort on retaliating against a defector (and the defector's family) to discourage other defections.
- Clearly defined policies on exploitation must be established.

One of the major problems confronting a commander is that many of his officers and men will not trust the returning defectors. To counter this logical distrust, the commander implements a massive command information program that includes handling, treatment, and use of defectors. Experience proves that one of the best ways to reverse the feeling of distrust is to publicize the help that defectors give to the friendly forces. The returnee's knowledge of the insurgents' tactics, terrain, and current situation is invaluable to the countering forces.

One of the government's most difficult tasks is to identify the enemy and the defector is often the only person who knows the enemy; consequently, a major task of friendly military personnel is to exploit this knowledge. Former insurgents may be used as scouts, guides, members of collection and reconnaissance units, and monitors for interpreters.

Special interrogation procedures are necessary for working with a defector. Experience has shown that most defectors will talk freely without the use of pressure. Generally, the best technique is to employ the interview method. The interviewer first must gain the confidence of the defector, and interviews should not be continued unless the interviewer believes that good rapport and communication have been established. Because most defectors are highly apprehensive immediately after their escape, it often requires several interviews to establish communication. It may be useful to have earlier defectors talk to all new returnees, telling them that they have made the right decision by defecting.

The interview environment is extremely important. Although a private room is desirable, elaborate equipment is not

necessary. With new defectors, it is helpful to have intelligence requirements mentally fixed so that resort to paper and pencil is not necessary. The defector should be convinced that he is important and has valuable information that can be used to help defeat the enemy.

Rapid and accurate interrogation of knowledgeable returnees is necessary if effective exploitation is to be accomplished. Generally, the best procedure is to use normal military communications to report information gained from interrogations. Communications between police, government officials, and other sources are coordinated because many insurgents defect to governmental agencies other than military units. Reporting by those agencies helps to speed information to the user.

If the country is so organized, there is a military reporting headquarters at district, province, and region. Forms used for reporting must be simple, and some basic information should be reduced to blocks for check marks. It often will be beneficial if the forms are bilingual.

Intelligence agencies keep the lower echelons informed of any special requirements so that special reports can be forwarded. Each echelon in the reporting channel keeps a reference file on all defectors. The file contains basic information, such as date of rally, area of operation, former job with insurgents, special knowledge, and disposition. The information is readily available so that an individual can be quickly located for exploitation at any time.

Security

Security for defectors is essential. If the exploitation program is working well, the insurgents will counter it with attacks against individual returnees and compounds where returnees are kept. Normal active and passive security measures are improved by organizing the defectors into self-defense units. Special protection is given to high-level defectors—perhaps evacuating them from the immediate battle area even though they may be able to provide exploitable tactical information.

Special consideration must also be given to a defector's family. Immediately after a person defects, the family should be located. If they are in an enemy controlled area, their identity may have to be concealed before the defector can be exploited. When defectors cannot be exploited because of the family's location, plans should be made to evacuate the family to a secure area.

A successful defector program includes effective means for returnee rehabilitation, a phase that requires national support. Planning and coordination of national resources are required when jobs, arable land, and educational facilities are to be provided.

Reception Centers

Rehabilitation begins at the reception center as soon as a returnee has been exploited for intelligence and PSYOP. Centers are established in secure areas near the defectors' homes, if possible. It is of utmost importance that all promises disseminated by the PSYOP program be fulfilled as soon as possible.

A new returnee is made to feel welcome. Experience has shown that an effective way to help a new returnee overcome initial shock is to assign him a sponsor-a returnee who has been at the center for some time. A special ceremony (such as a retreat formation) is held to introduce this individual to the rest of the group. In addition to temporary jobs, such as sponsoring members, returnees are hired to fill as many of the permanent administrative jobs at the center as possible. They know the problems of the returnee; therefore, they are very effective in rehabilitating the former enemy.

While at the centers, individuals are given indoctrination courses on government objectives and the responsibilities of individual citizens. Detailed programs of instruction are centrally prepared, and supporting reference materials are provided to the rehabilitation administrators.

Vocational training may be centralized because of limited facilities and qualified instructors. This training is on a voluntary basis, and national coordination is required to

ensure that those individuals who successfully complete vocational training become gainfully employed.

To assist in their own protection, defectors should be organized into self-defense groups. The rehabilitation complex should be tied into the defense plan of the area, with some government forces placed in the center or located close by. Within the center, planted returnees are used to determine whether the enemy is trying to infiltrate the program. These specially trained individuals determine whether the center is providing the defectors all benefits due them. They also evaluate the center's overall effectiveness.

The defector program must include a follow-up phase to determine whether the defectors are remaining loyal to the government and becoming self-supporting. Field representatives working with the police receive information from defector program administrators when defectors have moved into their areas. These representatives determine what problems, if any, the defectors are having in being accepted by the general population. As a minimum, a system must be established whereby a former insurgent is required to register with the police in the area where he resides. The police would then be responsible for the security and surveillance of these individuals.

Returnees whose home areas are under insurgent control may require temporary homes. It is not advisable to place them in defector villages because they then become easy targets for the insurgents, which makes it harder for them to be accepted by the general public. Defectors resettle where they can find employment in trades learned during the rehabilitation portion of the program.

History demonstrates that a sound defector program is a valuable aid in defeating an insurgent movement. A good defector program supports the existing government by reducing the number of active insurgents, gaining support from the general population, and providing information that can be exploited to defeat the enemy. A good defector program is another form of combat power. To neglect it invites a longer conflict and unnecessary casualties.

Tactical PSYOP and Strategic Objectives

Ronald D. McLaurin

Exploitation of tactical opportunities for strategic PSYOP can be crucial to achievement of long-term goals.

A major cause of disaffection from the government during the early years of the Hukbalahap insurgency (1946-64) in the Philippines was the mistreatment endured by the populace at the hands of Philippine security forces. Accounts of individual abuses by police powers in the Philippines are legion. From independence until 1950, the poorly trained security forces suffered from bad morale and worse discipline. In the field, troops typically foraged for supplies at the expense of poor peasants. Indiscriminate weapons firing resulted in unnecessarily high noncombatant casualties. Worse, the Philippine constabulary sometimes shelled whole villages when some residents were suspected of harboring or abetting Huks. Suspects were seized without due process of law, then beaten or otherwise treated inhumanely. Police corruption was widespread and resulted in such bitter, frustrating experiences for the peasants that many of them supported or joined the Huks.¹

After Ramon Magsaysay became secretary of national defense in September 1950, however, many important and effective steps were taken to protect noncombatants during tactical operations and to build confidence in their military forces.

The first step, an innovation in tactical organization, improved the supply situation in the armed forces. (Inadequate supplies had led to foraging by troops in the field.) The introduction of self-sufficient battalion combat teams (BCT) reduced the interdependence level, which had slowed army responsiveness. The BCTs displayed initiative, flexibility, and resistance to Huk intelligence-gathering. BCTs were "autonomous in almost

every sense except for strategic command, which was placed under the commander of the four military areas in the country."²

Second, in those cases where security forces abused their authority or did not treat civilians with respect, an effort was made to ensure that prompt and appropriate punishment was meted out. Because the objective was popular sympathy, not merely appropriate punishment, a certain degree of publicity attended these self-administered acts of justice on the part of the military.³

Third, civil affairs officers were attached to each unit to contact and work with the people-to inform them of the government's objectives and to make the military aware of the needs, interests, and problems of the local citizenry. This activity was designed to overcome the troops' previous lack of positive contact with the Filipino masses. It resulted in close relationships, more effective civic action programs, and better tactical intelligence. Civil affairs officers were also responsible in large measure for the implementation of the population protection program⁴

A further instrument to ensure that the armed forces acted with self-restraint toward the civilian population consisted of an arrangement with the Philippine telecommunications facilities whereby any citizen, for the equivalent of five cents, could send a telegram of complaint about troop behavior directly to Secretary Magsaysay's office. The secretary maintained a pledge to respond to each complaint and initiate an investigation into the circumstances that gave rise to it within 24 hours. The availability of this means to redress grievances, and the government's determination to follow through, were impressed upon the armed forces for maximum deterrent effect.⁵

Yet another change involved the dispatch of military doctors with individual units in the field. This function served both the military and noncombatants in the area. The doctors provided medical aid to civilians who were injured through either combat or accident. They also gave general medical attention to people who in many cases had never seen a doctor before.⁶

As the program to protect and work with the indigenous population progressed, even more flexible approaches were essayed in an effort to ensure the protection of civilians from

abuse, loss, or casualty during tactical operations. By May 1954, "the patrols were firing at the Huks only as a last resort."⁷ Through these and other initiatives, PSYOP at the tactical level contributed to the major strategic objective of the government reacquisition of the loyalty and support of the population.

PART IV

Case Studies
of
PSYOP Applications

Introduction

These case studies present and clarify PSYOP goals, roles, and methods. Col Benjamin F. Findley, Jr., USAFR, condenses and analyzes US and Vietcong PSYOP in the Vietnam War. He analyzes the Chieu Hoi campaign, the vulnerabilities of the North Vietnamese army and the Vietcong soldier, and summarizes the key US and Vietcong PSYOP appeals and techniques.

MSgt Richard A. Blair, USAFR, and Col Frank L. Goldstein, USAF, 'present the Iraqi propaganda network used during the Persian Gulf' War. They explore Iraq's skill in creating and using a variety of media outlets, internally and externally.

Col Dennis P. Walko, USA, details tactical and consolidation PSYOP activities in Operations *Just Cause* and *Promote Liberty* in Panama. He presents major PSYOP lessons learned.

Laurence J. Orzell shows that Poland's underground media were nongovernmental PSYOP in action as well as a significant part of the Polish sociopolitical scene. According to Orzell, this underground media enabled the Poles to resist the enforcement of the adoption of communist ideals and values.

Colonel Goldstein refers to the 1986 Libyan Raid as a PSYOP effort and reports the results.

Maj James V. Keifer, USAF, Retired, discusses national anti-drug policy and relates the role of military psychological operations in solving drug problems.

The late Gen Richard G. Stilwell, USA, Retired, discusses the importance of the political-psychological dimensions of conflict and insurgency. He explores, through several examples, the failure of the American public, the media, and even our bureaucracy, to recognize and counter political and psychological warfare conducted against US policies.

In Major Keifer's second piece, he gives an overview of the psychological dimension of the Persian Gulf War relative to the diplomacy process and the quick end to the war.

Colonel Goldstein and Col Daniel W. Jacobowitz, USAF, Retired, in case studies on Operations *Desert Shield/Desert Storm*, support the urgent need to increase US sensitivity to the psychological dimension of warfare. They not only solidify the

PSYOP requirement but also point out our weaknesses and future challenges.

US and Vietcong Psychological Operations in Vietnam

Col Benjamin F. Findley, Jr., USAFR

This paper reviews and analyzes selected US and Vietcong PSYOP strategies, tactics, and problems in the Vietnam War. Included are the Chieu Hoi campaign, the vulnerabilities of the North Vietnamese Army and the Vietcong, and key PSYOP techniques of both the US and the Vietcong.

Coordination of Decentralized United States Psychological Operations Agencies

The US PSYOP effort during the Vietnam War was decentralized among the US Military Assistance Command, Vietnam (MACV), the US Information Service (USIS), and the Agency for International Development (AID). Each agency was responsible for one or more aspects of the foreign information/ PSYOP effort conducted in South Vietnam. The agencies "operated independently of each other," according to Ronald D. McLaurin of the American Institute for Research in Washington, D.C. In 1965 President Lyndon B. Johnson established the Joint US Public Affairs Office (JUSPAO) to integrate the PSYOP activities, to avoid duplication of effort, and to increase the overall effectiveness of the effort.

According to then 4th PSYOP Group Commander Taro Katagiri, the variety of agencies involved made it difficult to coordinate the PSYOP effort as well as to establish centralized control and direction in the Republic of Vietnam (RVN) in 1968-69. There were repeated examples of lack of coordination. Mr Katagiri recalled that on 16 February 1969 there was an airborne leaflet mission in which a total of 84,000 leaflets were disseminated without prior coordination with the area task force PSYOP officer. And US PSYOP teams sometimes

appeared at hamlets on audiovisual or loudspeaker missions only to discover a province team conducting a similar mission.

Roles and Goals in Vietnam

PSYOP responsibilities grew during the war without the guidance and control necessary to accomplish the corresponding goals. The breadth of American roles and goals led to rapid growth in the size of US PSYOP elements. PSYOP goals:

- 1. undermine popular support for the insurgents,**
- 2. enhance the image of the government of the RVN,**
- 3. increase Vietnamese understanding of, and elicit support for, US policies in Vietnam, and**
- 4. engender international support for US policy in Vietnam.**

Relatively few PSYOP-experienced personnel were available, however, and those few were spread among the many groups involved in PSYOP. According to MACV, the US PSYOP mission in Vietnam included the following entities:

- the American Embassy in RVN,**
- the Mission PSYOP Committee,**
- the JUSPAO,**
- MACV,**
- Civil Operations and Revolutionary Development Support (CORDS),**
- US Army Republic of Vietnam (USARV),**
- the 4th and 7th PSYOP Groups,**
- Naval Forces, Vietnam (NAVFORV), and**
- the Seventh US Air Force.**

In PSYOP Policy number 51, 28 December 1967, the JUSPAO Planning Office established the following PSYOP priorities:

- 1. the Government of Vietnam (GVN) image,**
- 2. Chieu Hoi (come home),**
- 3. revolutionary development (agriculture and improved living standards self-help projects),**
- 4. refugee program,**

5. public safety,
6. the US image,
7. GVN mass media advisory effort, and
8. telling the Vietnam story.

The Chieu Hoi Campaign

Two special PSYOP targets were the Vietcong (VC) and the North Vietnamese Army (NVA) soldiers in South Vietnam. Two Chieu Hoi operations carried out in the Delta during 1970 and 1971 proved that PSYOP and combat pressure working together could get results. The operations were Operation *Roundup* in Itien Hoa Province and Project *Falling Leaves* in Kien Giang Province. Operation *Roundup* produced hundreds of enemy defectors, according to Colburn Lovett, a USIS foreign service information officer. One PSYOP technique was to take pictures of ralliers/defectors and have them sign a simple message on a leaflet, encouraging their comrades to join the cause. Another technique was to use loudspeaker teams of former VC soldiers who were sent back into the areas of their units to speak to their comrades in the bush. Project *Falling Leaves* combined Vietnamese and US personnel working in joint PSYOP activities. Armed propaganda teams (100 percent ex-VC) made deep penetrations and extensive face-to-face communications. All possible media were used, including boat-carried loudspeaker teams, leaflet drops, radio tapes, and television appeals by former VC.

There are significant PSYOP lessons here for all commanders. During the two-month period in 1971 when intense PSYOP supplemented military action, there were 1,150 defectors, while in the six weeks before and the four weeks after the intensive PSYOP campaign, there were only a total of 211 defectors. PSYOP, if applied on an intense scale, is of significant value to commanders in securing the surrender of enemy forces. The author believes that military operations conducted without PSYOP support will not be as successful as those conducted with it.

A PSYOP project initiated by Special Forces in conjunction with a detachment of the 245th PSYOP Company, JUSPAO, and the Vietnamese Information Service (VIS) had as its

objective bringing Vietnamese government presence back to the area around Duc Co in Pleiku Province. The area had slipped into the contested category. Using the Duc Co Special Forces Camp as its base, the PSYOP effort was aimed at all of the villages and hamlets within a 10-kilometer radius. This Chieu Hoi campaign, adopted in 1963, offered communist soldiers forgiveness and exoneration for temporarily slipping into the alien communist path. They could return home to their families and the just cause of the republic. The term *surrender* was not used. Medics held sick calls over a four-day period to attract the sympathetic attention of the villagers. Over 800 villagers were treated during this four-day period. Face-to-face contact allowed the representatives of the VIS to stress the theme that the VC were preventing peace while the government of Vietnam was working for peace. Valuable information concerning the popular resentment toward VC methods came to light and the team members were careful not to make the same mistakes, particularly with regard to pressures exerted to bring villagers to propaganda sessions. At the end of four days, the operation was judged to be a success, so much so that the wives of eight VC persuaded their husbands to seek amnesty as Chieu Hoi returnees.

Vulnerabilities of the North Vietnamese Army Communist Soldier

The NVA soldier in South Vietnam presented a particularly difficult target for GVN/US PSYOP aimed at inducing surrender or defection. He had a relatively high state of indoctrination, which was reinforced by a range of psychological controls that included self-criticism sessions, the three-man cell, and endless repetition of communist themes. A contributory reason for the resistance of NVA soldiers to Chieu Hoi inducements was that defection for most did not hold the promise of an early family reunion. (Defecting Vietcong were South Vietnamese who were going home.) Moreover, unlike the VC guerrilla who may be a teenager conscripted from his hamlet and sent into battle without much party schooling or political indoctrination, the NVA soldier was the product of a closed totalitarian society. He had been subjected to com-

munist indoctrination from his earliest school days. This made him more resistant to PSYOP entreaties. Further, the NVA soldier found himself fighting in a region unfamiliar and semi-antagonistic to him, usually in relatively uninhabited areas and with little chance for contact with the civilian population.

US/GVN PSYOP messages pointed out three options: (1) to rally, take advantage of the Chieu Hoi program and quickly become a free citizen of the RVN; (2) surrender as a prisoner of war and await repatriation at the end of the war in the safety and relative comfort of a prisoner of war camp; and (3) counsel NVA soldiers to devote all their efforts to individual survival rather than getting killed or maimed for an unjust cause. Even a partial success in this PSYOP effort would contribute to shortening the war by reducing the combat effectiveness of NVA units.

The vulnerabilities of NVA soldiers did not change much throughout the war. Separation from families, the hardships of infiltrations, fear of allied arms, and, perhaps most significantly, the contrast between what they had been told by the cadre and what they actually experienced, were the major exploitable weaknesses.

The surrender program for the Northern troops (Chieu Hoi) received the greatest amount of American emphasis and money. Reception centers for defectors (hoi chanh) were built at various locations throughout the country. They usually remained in the camps from 45 to 60 days before being released and resettled. They were given rewards (e.g., money to buy food) for turning in their weapons. NVA soldiers realized that defecting might prevent them from ever going home to the North.

Key Psychological Appeals

According to Vietnam veteran and former Air Force intelligence officer Lt Col Robert Chandler, five major US PSYOP appeals were applied in Vietnam:

1. fear of death,
2. jungle hardships,
3. loss of faith in victory,
4. concern for family, and
5. disillusionment.

The aim of the fear appeal was to convince the enemy that he faced an overwhelming danger of being killed if he remained with the communists. Message themes included "death lurks everywhere," "born in the north to die in the south," and "no shelters are safe from the bombs of the B-52." Not all fear appeals were successful, however: In one appeal, fear leaflets imprinted with the ace of spades as a sign of death were dropped and decks of cards with prominent aces of spades were left along VC trails; unfortunately, Vietnamese card decks did not include the ace of spades. Another example of fear-appeal failure was the use of gruesome leaflets depicting corpses. This had a boomerang effect because the hoi chanh felt that the government was gloating over the deaths of fellow Vietnamese.

The hardship appeal reminded enemy soldiers of their loneliness, homesickness, poor living conditions, and insufficiencies in food and medical supplies. The "loss of faith in communist victory" appeal sought to convince the enemy that the Republic was winning the struggle. It emphasized battlefield losses and the number who had already rallied. The "concern for family" appeal, one of the most effective, was very emotionally based. Loneliness, nostalgia, and the desire to return home to loved ones were primary factors motivating communist soldiers to defect or surrender. The disillusionment appeal was based on the idea that the North Vietnamese soldier might be able to withstand fears and hardships as long as he was convinced that Hanoi's aims were just, but would be more willing to defect when he became skeptical of them.

Four special PSYOP techniques were employed in Vietnam: distribution of safe conduct passes, money for weapons, focus on returning home to celebrate during the Tet New Year, and armed propaganda teams composed of hoi chanh. Many PSYOP professionals believe these teams were effective because of their personal touch to the Chieu Hoi invitations.

Important Nonmilitary Considerations

There were several misconceptions about PSYOP. Taro Katagiri, former 4th PSYOP Group commander in Vietnam, believed that many people considered PSYOP a separate and

distinct activity, unrelated to other functions-especially in nonmilitary situations.

PSYOP was not amply exploited to support economic programs such as rural construction, political programs, medical assistance, or humanitarian efforts. Another misconception was that PSYOP involves just verbal communications and, thus, many Americans were insensitive to nonverbal gestures, posture, signs, and physical appearance.

An individual's response to persuasive communication in any culture is based on and reinforced by his regular interpersonal relationships. An individual usually consults a member of his/her primary group, a friend or relative, before taking action in response to persuasive messages. A great number of the VC rallied/ defected to the Chieu Hoi program through an intermediary who was a relative or trusted friend. Many did not defect until they received assurance from a relative or friend that the government would keep its promises concerning good treatment and other aspects of the amnesty program.

Cultural Considerations in Vietnam

For the Westerner, one of the most important elements to understand about Vietnamese culture is the completely personal basis of the society. "'Truth" for the Vietnamese is not the factual statement or actual occurrence of an event; it is in the pleasantness of personal relationships. A Vietnamese's entire character lies in not giving or receiving personal embarrassment or shame. For example, it would not be culturally correct for a Vietnamese to shout at or reproach a waiter over bringing the wrong meal order.

He would either quietly request a change or simply eat the wrong meal and pleasantly smile. Understanding and progress are less important than pleasant associations. Distrust of strangers is a part of Vietnamese culture, and Vietnamese people politely keep their distances. Vietnamese answers to questions will reflect what the questioner may want to hear. A Vietnamese will avoid lengthy associations with strangers but will be pleasantly polite. The Vietnamese culture places a very high value on the family and on elder citizens.

Vietcong Techniques

According to Philip Katz, the reverse of the trusting value was used by the VC in their attempt to deter defection. His example is of a VC or NVA soldier who claims to his comrades that he was captured by the GVN or US forces and had subsequently escaped. He testifies that while a prisoner he was treated badly and that he had firsthand knowledge that the government of Vietnam did not abide by their good treatment promise.

Katz says that research findings substantiate the fact that intimate Vietnamese associates tend to hold opinions and attitudes in common and are reluctant to depart unilaterally from their group consensus. They talk frequently among themselves and establish a trusting bond of friendship upon which to primarily base their decisions. Interpersonal communication is highly valued; mass media are of secondary importance. ¹

Vietcong National Liberation Front

Douglas Pike presents the three VC PSYOP programs of *dan van*, *dich van*, and *binh van*. *Dan van* was the VC effort to develop support in areas that it controlled while *dich van* was the effort to develop support in GVN-controlled areas. *Binh van* was the recruiting program among Army of the Republic of Vietnam (ARVN) troops and GVN civilian servants. Destruction of South Vietnam's armed forces was the overriding priority for the VC; violence, armed attacks, assassinations, kidnappings, terrorist acts, and *binh van* were employed.

The top objective of *binh van* was to induce unit desertions, preferably accompanied by an act of sabotage. The next highest objective was to induce individual military desertion or civilian defection, preferably accompanied by an act of destruction or a theft of key documents. Next was to induce major and significant opposition within the military or civil service, either covertly or overtly.

Binh van PSYOP techniques included the following:

1. enunciation and constant restatement by all possible means of a liberal VC policy toward recanting military and civil servants, including prisoners;

2. wide and intensive use of terror and psychological intimidation against key officials and military units, including killing every person;

3. use of penetration agents to infiltrate and develop support within the military and civil service;

4. use of family ties and friendships to induce or coerce military personnel and civil servants to desert, defect, or covertly serve the VC;

5. tangible and intangible rewards for those who deserted or defected, (for example, the VC announced it gave \$2,000 to a group of deserters in Long An Province);

6. encouragement among potential draftees to oppose the military draft; and

7. distribution of two songbooks containing 20 songs. The emotional songs were about the homeland and total victory. They contained communist ideas, praised party leadership, and presented the great qualities of the communist guerrillas. Cultural dramas were also used to promote the cause.

US PSYOP objectives in the Vietnam War were ill-fated from the beginning, primarily because of the "foreign invader" image of the United States. US psychological operations were used simultaneously as a means of achieving US foreign policy goals and as a substitute communications tool for the Republic of Vietnam to create nationalism. We misjudged the will of the communists to prolong the revolution and bring about reunification. We also misjudged Vietnamese reluctance to support any central government. In addition, we could not win the support of the US Congress to fight the type of war that needed to be fought. Instead, we fought a protracted war that was doomed. We lost the hearts and minds of the Vietnamese and our fellow Americans; we lost them to the PSYOP of the Vietnamese communists. *We must learn the values of strategic, operational, and tactical PSY OP from this devastating experience.*

The Iraqi Propaganda Network

**MSgt Richard A. Blair, USAFR
Col Frank L. Goldstein, USAF**

During the Persian Gulf War, Iraq had considerable success in mounting a psychological warfare (psywar) campaign that reached a wide domestic and foreign audience. While some might attribute this success (at least in part) to overzealous international media providing newsworthy coverage of events in the Gulf, the bulk of the accomplishment is a credit to Iraq's skill in creating and using a variety of media outlets as propaganda dissemination mechanisms.

Following his established pattern, which was designed to prevent the accumulation of power within any one governmental entity, Saddam Hussein distributed propaganda duties among many offices within the government and the Baath Party. While most of these offices officially answered to the Ministry of Culture and Information (MCI), they were actually managed through informal channels by the Baath Party, the Revolutionary Command Council (RCC), and Saddam Hussein himself.

Within Iraq, all broadcast facilities are owned and operated by the Broadcasting and Television Organization of the MCI. Prior to the invasion, Iraqi broadcast capabilities included two prime-time television broadcasts, two domestic radio services- "Baghdad Domestic Service" and "Voice of the Masses" (VOM)- and shortwave radio broadcasts of VOM in Kurdish, Turkoman, and Assyrian.

Shortly after the invasion, Iraq took over Kuwait's radio facilities and began operating the Provisional Free Kuwait Government Radio program. They also implemented at least five additional shortwave radio programs designed to undermine the Saudi and Egyptian governments and the morale of Arab troops in the Gulf.¹

Once Allied coalition bombing commenced, the Iraqi broadcasting capability was severely hampered. Iraq's television capability was completely destroyed and the only radio broadcasts noted were "Baghdad Domestic Service" and "Voice of the Masses"-both operating at greatly reduced signal strength.

The printed media within Iraq was also largely controlled by the government. The Baath Party published the largest daily newspaper in the country, *Al-Thawrah*. The MCI managed Al-Jahameer Press House, which published two other widely read dailies in Iraq, the Arabic-language *Al-Jumhuriyah* and the English-language *Baghdad Observer*. The Ministry of Defense also published an Arabic daily newspaper, *Al-Oadisiyah*, and other ministries and agencies of the government sponsored the majority of some 12 weekly papers and monthly magazines published in Iraq. Even where they did not control a publication directly, the government still influenced its contents-the MCI's General Establishment for Press and Printing licensed and censored every publication that appeared in the country.

The Iraqi government also expended considerable resources to reach foreign audiences. Iraqi television aired video clips to foreign broadcast organizations over both ARABSAT and INTELSAT. The Iraqi News Agency (INA) gathered and translated news and commentary from Iraqi press, radio, and television sources and disseminated reports by wire to subscribers around the world. The INA distributed its material even further through its participation in the Non-Aligned News Agency Pool, a service of the Non-Aligned Movement that facilitates the sharing of news items among member nations.

Iraq also controlled several other significant media resources, the most notable of which was the "Voice of the Palestine Liberation Organization," a radio program produced by Palestinian elements in Baghdad and broadcast over the Iraqi shortwave radio network. They had varying degrees of influence over some ideologically compatible media like the Libyan news agency JANA and the Palestine Liberation Organization (PLO) radio in Algiers. By mid-November, Iraq was successful in rallying information officials of Palestine, Tunisia, Jordan, Yemen, Mauritania, and Sudan to issue a joint statement endorsing the Iraqi position and discussing ways of bolstering

media cooperation to confront the intensive hostile media campaign launched by the United States and its allies.

Additionally, Iraq took advantage of every opportunity to provide its views to foreign news agencies through government officials, both at home and abroad. For example, an informal examination of three days' worth of Iraqi propaganda in mid-August revealed official statements made to the press in various countries by three RCC members, seven government ministers, 10 ambassadors, a governor, a military commander, and the speaker of the National Assembly.

Iraq also displayed great success in varying the spokesmen mouthing their propaganda. Sometimes this simply took the form of issuing statements in the name of various groups or individuals; for example, the children and vanguards of Iraq or the American hostage Golden Johnson. More often, it consisted of quoting pro-Iraqi statements elicited from various amenable personalities such as Palestinian leaders George Habash and Nayif Hawatimah or of distorting statements by world leaders whose condemnations of Iraq left room for misinterpretation.

Iraq allowed the first Western journalists into Baghdad on 18 August 1990. Later, however, all foreign journalists except a news team from Cable News Network (CNN) were expelled and these journalists were always strictly controlled. They were escorted everywhere, and all news reports leaving Iraq were censored by the government. Although most of the world knew that Iraq was censoring these journalists' reports, use of this link to the CNN network still greatly enhanced many of Iraq's propaganda campaign objectives.

Additionally, Iraq used covert methods to access outlets that could not be influenced openly or directly. Stories of widespread Iraqi bribery surfaced continuously throughout the crisis. Supposedly, influential members of various countries were offered valuable gifts and monetary compensation to promote pro-Iraqi sentiment. One confirmed report of this activity resulted in the expulsion of an Iraqi Embassy official in Pakistan for "providing financial assistance for the publication of propaganda materials against the state [of Pakistan]."2

Iraq also financed several newspapers in Western Europe to gain Arab support throughout that region. However, toward

the end of the crisis, several of these newspapers either closed down or reduced operations. It is uncertain whether Iraq gave up this project due to budgetary reasons, lack of discernible positive results, or a combination of both.

Iraq's counterpropaganda efforts completed the network. With some modifications, Iraq took the approach that nearly all hostile themes and attacks should be countered openly and vociferously. Therefore, the Iraqis collected hostile propaganda, analyzed it, developed appropriate themes in response, and inserted them into their own campaigns within hours. For example, within hours of President George H. Bush's address to the US Congress on 11 August 1990, INA carried a lengthy rebuttal and sent it out over the newswire. Shortly thereafter, INA carried a second long rejoinder composed by Foreign Minister Tariq Aziz. By the evening of the 12th, the editors of every Iraqi daily paper had prepared, for publication in the morning papers of the 13th, their own attacks on the speech. To complete the cycle, INA then compiled a summary of the newspapers' criticisms that was circulated on the newswires early on the 13th.

In analyzing Iraq's success in disseminating propaganda to foreign and domestic audiences, three key components are easily identifiable. First, Iraq's invasion of Kuwait grabbed world interest and focused international media. Second, the government's skillful use of modern technology in mass communications provided it with instant access to the world populace. And third, Iraq used aggressive and imaginative propaganda campaigns to obtain and retain the widest possible mass audience.

By combining these three elements, Iraq not only made significant contributions to its national objectives but also created a powerful force multiplier. This multiplier presented the illusion that the Iraqi military capabilities and will to fight were much stronger than reality proved them to be.

Iraq's achievements in coordinating their internal and external propaganda efforts resulted in significant success in reaching world audiences. Although ultimately unsuccessful, the Iraqi effort clearly demonstrates that imaginative use and integration of today's mass communications technology allows any country to influence audiences well beyond their borders.

Notes

1. These five shortwave radio programs were "Holy Mecca Radio," first observed on 10 August 1990; "Voice of the Egypt of Arabism," first observed on 11 August 1990; "Voice of the Peninsula and the Arabian Gulf," implemented on 29 August 1990; "Voice of Peace," implemented on 11 September 1990; and "Voice of Arab Awakening," first observed on 13 October 1990.
2. Pakistani newspaper *Markaz*, 16 January 1991.

Psychological Operations in Panama During Operations *Just Cause* and *Promote Liberty*

Col Dennis P. Walko, USA

US military psychological operations units figured prominently in 013eration *Just Cause* in Panama. Even US television viewers gained some appreciation of PSYOP; they saw broadcasts from the former Panama Defense Force-dominated national television channel that included "mysterious" US and Panamanian nation symbols. They saw safe conduct passes dropped on Panama Defense Force and "Dignity Battalion" (DIGBAT) positions, and they heard tactical loudspeakers appealing to enemy forces to cease resistance and surrender. Perhaps our country's last television view of PSYOP activity in Panama was that of the loudspeaker in front of the Papal Nunciature blaring heavy metal rock music to "drive Noriega out of his mind" or "keep him awake."

Military PSYOP disappeared from US public view immediately after Noriega surrendered to US authorities, only to reemerge during Operations *Desert Shield* and *Desert Storm*. Americans once again were exposed to news articles featuring PSYOP leaflets and loudspeakers.

In each case, the attitude of our mass media and the ensuing public response were favorable to PSYOP. Articles in newspapers and journals portrayed PSYOP as both cost effective and critical to success. Official and unofficial US military circles said PSYOP was a valuable force multiplier that had induced enemy forces to abandon their positions or surrender, thereby reducing loss of life on both sides.

Less conspicuous was the bulk of psychological operations during *Just Cause*. Most PSYOP activities and accomplishments in Panama were hardly noticed by either the US public

or the general military community. The special operations community, however, did notice. The lessons learned in Panama were incorporated into standing operating procedures. Where possible, immediate changes were made to capitalize on the PSYOP successes of *Just Cause* and *Promote Liberty*. This led to improved production, performance, and effect in the next contingency, which took place within six months after the return of the last PSYOP elements from Panama. Operations *Desert Shield* and *Desert Storm* employed PSYOP at an order of magnitude and effectiveness that many credit to the lessons learned from Panama.

Recognizing that much of *Just Cause* and its complementary civil-military restoration operation, *Promote Liberty* is still classified, this article has been prepared to informally discuss PSYOP during the Panama contingency. It will briefly cover the evolution of PSYOP plans and operations, describe their objectives, and show how PSYOP were successfully executed. Hopefully, this piece will show there was a lot more to PSYOP during this contingency than rock music and surrender appeals, and that PSYOP did, in fact, contribute significantly to the overall success of the operation.

Panama contingency plans had been under development for years prior to *Just Cause*. These contingencies were to range from evacuation of US and third country nationals to full-scale combat operations against Noriega, his Panama Defense Forces (PDF), and (later) the DIGBAT goon squads. The latter targets were increasingly viewed as threats, not only to Panamanians, but also to US dependents. Contingency planning culminated with consolidation and reconstruction operations to follow any combat scenario.

Psychological operations were well integrated into the planning process. The worst-case scenario involved combat operations in Panama. For this option, planners recognized the importance of promoting prompt cessation of hostilities and minimizing civilian casualties. The following were key concerns for this option:

- US casualties
- Panamanian civilian casualties
- Collateral damage

- Delay in US troop withdrawal
- Disinformation and hostile propaganda

The five concerns were interrelated. If the PDF offered concerted resistance to US troops, casualties on both sides would escalate, civilians would likely suffer, Panama City and US military installations might sustain severe property damage, and US troops could become bogged down in an effort which would increasingly be susceptible to counterproductive local, US, and worldwide criticism. Related to all this was the concern that the Noriega-controlled Panamanian media-essentially a propaganda machine-would continue to broadcast material detrimental to US interests and stir up doubts as to the effectiveness of our operations.

Additional concerns for consolidation or reconstruction operations included repairing the government and economic infrastructure and establishing a functioning democracy. Specific PSYOP missions and requirements were identified to support contingency plans and address all the aforementioned concerns.

On the tactical level, loudspeaker teams were scheduled to accompany all major ground combat units. Their objective was to convince the enemy to cease resistance and surrender while advising innocent civilians how to stay out of harm's way. As the plan matured over time, loudspeaker teams received increased emphasis: a few months prior to the operation, the designated commander for Joint Task Force-South (CJTF-South), then Lieutenant General Stiner, directed that loudspeaker teams be provided to each infantry battalion (Army and Marine Corps) and each SEAL battalion-equivalent participating in the assault phase of the operation. This was probably the highest loudspeaker-to-combat force ratio in the history of the US military.

On the national-strategic level, a PSYOP task force would be formed, based upon the regionally oriented 1st PSYOP Battalion (Bn) augmented with additional loudspeaker, radio, and television assets from the 4th PSYOP Group (Gp). The PSYOP task force (TF) main body was to deploy early, assume control of ongoing tactical PSYOP, and provide general PSYOP support to the operation, employing full media production and

dissemination capabilities. Its objectives were to conduct national-level PSYOP designed to minimize interference and resistance, and to foster support for US military operations and efforts by the Panamanian government to restore law and order.

Various prepackaged PSYOP materials-prerecorded TV, radio, and loudspeaker tapes; radio and loudspeaker scripts; music; and designs for printed leaflets and posters-were developed from 1987 to 1989. These were approved by an interagency committee headed by the commander of US Army South.

The commander of the 1st PSYOP Battalion, 4th PSYOP Group, based at Fort Bragg, North Carolina, was the designated commander of the PSYOP TF in the eventuality of any Panama contingency. He was responsible for developing detailed contingency PSYOP plans, annexes, and products, and for coordinating all PSYOP-relevant details with USSOUTHCOM and XVIII Airborne Corps. Prior to the actual operation, often during routing trips to Panama, the commander and other members of his command visited many of the principal target locations and identified potential production facilities-a precaution against a late arrival of PSYOP production equipment.

Facilitating this planning process was the fact that successive 1st PSYOP Bn commanders served as CINCSOUTH's senior theater PSYOP officer, knew most key players on the USSOUTHCOM and USARSO staffs, and had a small liaison cell located in the USSOUTHCOM J-3 directorate. Furthermore, once the XVIII Airborne Corps commander (General Stiner) was designated CJTF for the contingency, coordination between the battalion and that headquarters (including one-on-one meetings with General Stiner) became a frequent affair. General Stiner would later assume overall responsibility for planning and commanding the operation. He took a personal interest in PSYOP, further enhancing their planning, coordination, and execution.

By March and April 1988, Noriega had increased provocative actions against US forces in Panama, having sent harassment patrols into the US-controlled Arraijan tank farm (fuel storage and distribution depot adjacent to Howard Air Force Base) and the nearby US Army ammunition storage facility. At this point,

the National Command Authority ordered additional security forces deployed to Panama, with additional deployments in May 1989. Included among these forces were an additional infantry brigade, military police, and three PSYOP loudspeaker teams. These forces remained in Panama until hostilities were initiated.

The three loudspeaker teams deployed as a tactical detachment with sufficient personnel, vehicles, radios, and speaker systems to permit reconfiguration as five teams if the need were to arise. As time dragged on, soldiers and equipment were rotated to and from Panama to such a degree that virtually every battalion in the 4th PSYOP Gp had an opportunity to deploy soldiers to Panama. This would prove extremely important: by the time of the contingency, a large number of PSYOP soldiers had firsthand knowledge of the area, the equipment, the supported commanders already in Panama, and the Spanish language.

As tension in Panama grew, loudspeaker personnel became integral members of US tactical exercise and security forces. These units often became embroiled in PDF and DIGBAT-orchestrated protests during several of the increasingly frequent exercises conducted by US forces to reassert US treaty rights. The loudspeaker teams not only effectively employed prerecorded tapes which would also be useful later, during the contingency; they prepared other announcements on the spot. These encounters served as valuable training and experience for PSYOP soldiers who would support *Just Cause* and *Promote Liberty*.

Two events in Panama were to have a significant effect upon PSYOP planning for the contingency. The first was Noriega's nullification of the May 1989 Panama presidential elections. Besides the obvious worsening of Panama's internal conditions and international relations, this act gave US PSYOP a number of obvious themes for use against Noriega and his "inner circle." It also heightened the probability of a combat contingency and energized even greater attention to the contingency planning process (including PSYOP planning and preparation). From this point forward, both the 1st PSYOP Bn commander and the 4th PSYOP Gp commander spent increasing time in Panama, providing PSYOP planning expertise to

CINCSOUTH, his staff, and the US Country Team. (In fact, both officers were to return from lengthy TDY in Panama within 72 hours of the events that precipitated Operation Just Cause.)

The second event was the failed 3 October 1989 coup attempt by members of the PDF against Noriega. After the coup attempt, Noriega rapidly purged the PDF of its more moderate leaders and boosted training for the paramilitary DIGBATs. Prior to this coup attempt, the US combat contingency plan had focused on removing Noriega and his cronies from power while leaving the PDF institution alone; under these new conditions, it became increasingly clear that, in the eventuality of a contingency operation, the JTF would not be able to operate within those limited US objectives. Therefore, PSYOP materials that had been prepared prior to the coup required revision. The most time-consuming revisions were those associated with audiovisual products that had been prepared for possible broadcast over television.

As time passed and the situation in Panama worsened, it became clear to the 1st PSYOP Bn commander that he could no longer keep television and radio broadcast tapes up to date. To have done so would have worn out personnel of both the battalion and the 4th PSYOP Gp's Strategic Dissemination Company. Since these products were classified TOP SECRET-SPECAT, they could only be produced at night and on holidays when noncleared soldiers were off duty and away from the media production facility. Furthermore, this activity was beginning to tie up personnel who were key to other ongoing PSYOP activities in the USSOUTHCOM area of operations. Thereafter, for initial operations the PSYOP TF would depend upon the battalion's prerecorded music tracks, silent footage and logs, and written scripts that could be modified at the last minute and read "live" by PSYOP broadcast announcers. In fact, such modifications for radio and television broadcasts were made by the commander, from Panama, over long-distance telephone within hours prior to commencement of hostilities. All were used during the first 24 hours of Just Cause, constituting the first official US broadcasts in Spanish heard by the Panamanian population.

After General Thurman's assumption of command on 30 September 1989, the failed coup attempt that shortly followed, and General Stiner's designation as CJTF-South, conditions in Panama continued to deteriorate. US concerns for the safety and protection of US lives and property were heightened; preparation and coordination for a Panama contingency involving full-scale combat operations were intensified.

As a result, 4th PSYOP Gp loudspeaker personnel at Fort Bragg were placed on recall status for possible deployment on short notice. Loudspeaker system shortfalls were identified and additional systems were obtained from Army Reserve PSYOP units. Loudspeaker broadcast scripts in English and

Source: 1st PSYOP Battalion, US Army

Figure 1. These bilingual booklets were carried by tactical PSYOP loudspeaker teams, along with prerecorded tapes of the same messages in Spanish. Note the messages in the extract; US troops did not mince words.

Spanish were refined by the 1 st PSYOP Bn and published in a small handbook. Prerecorded tapes for loudspeaker broadcast were revised and additional announcements were recorded. Tapes and booklets were taken to Panama for use by the deployed teams if the time came to execute the contingency.

The 1st PSYOP Bn commander was designated by General Stiner as a member of a 20-man JTF-South staff element identified to predeploy to Panama in advance of the assault forces if the contingency were to be executed. As it turned out, this predeployment would prove important to the success of PSYOP in the Panama contingency. With the exception of the three loudspeaker teams already in Panama and the loudspeaker teams accompanying the airborne and special operations assault forces, the PSYOP TF would not arrive in Panama until after initial assault operations.

The commander, his forward liaison cell, the loudspeaker detachment, a prepositioned 4th Gp AM radio broadcast team, Volant Solo PSYOP TV/radio broadcast aircraft from the 193d Special Operations Group (SOG) of the Pennsylvania ANG, and the USSOUTHCOM J-3 PSYOP office would comprise the PSYOP planning, coordination, development and dissemination capability in Panama until D + 3. Late arrival of the main body notwithstanding, PSYOP employed a full range of media and other activities in support of initial combat operations-and with good effect.

During the early morning of 18 December 1989, two days after the fatal shooting of a US serviceman and the harassment of another and his wife by members of the PDF, the 20-man advance JTF-South staff element administratively and clandestinely deployed to Panama. The 1st PSYOP Bn commander assumed control of his forward elements in accordance with prior arrangements with USSOUTHCOM headquarters, although the members themselves still had not been informed of the pending operation, and in fact were not to be told until the night of the assault.

At 1900 hours, 19 December, the 1 st PSYOP Bn commander assembled the members of his liaison element, the loudspeaker detachment commander (now the company commander who, coincidentally, was in Panama conducting his assumption of command property inventory), and the commander of the

prepositioned AM radio broadcast team to notify them that Just Cause was to be executed on 20 December. The commander then organized the element to function on a 24-hour basis as his ministaff, interim PSYOP development cell, and radio broadcast team. Consistent with the JTF OPLAN, the loudspeaker detachment would break down into five teams which would link up with their designated supported units. The other loudspeaker teams and PSYOP liaison officers that were called for in the plan would deploy with their supported combat units and would operate in an attached or OPCON status-a command and control relationship which caused problems, as will be discussed later.

This sri jall PSYOP force was prepared to work in shifts until the PSYOP TF arrived. Although envisioned to function only for about the first 24 hours of the operation, it was this small group which planned, coordinated, and ran psychological operations for the first three days of the contingency. Once the remainder of the PSYOP TF had commenced operations, the liaison element continued as the JTF PSYOP staff section and PSYOP TF liaison at the JTF-South headquarters, maintaining continuous coordination with all elements of the JTF and coordinating aviation requests and leaflet drops.

In addition to AM radio broadcasts, initial PSYOP activities involved TV broadcasts of prepackaged materials from the 193d SOG's Volant Solo aircraft. The recently revised scripts were read live by PSYOP soldiers who had been picked up at Pope AFB, North Carolina, while the aircraft was en route to Panama. These broadcasts-all in Spanish-notified the Panamanian population of US intent and advised how to avoid accidentally becoming a casualty. (These were the "mysterious" broadcasts that puzzled some of the US media in Panama.)

The TV channel used for broadcasts by Volant Solo was Channel 2, the national channel commandeered by the Panamanian military shortly after the 1968 coup d'etat and controlled by the military until 20 December 1989. It was targeted for psychological impact, to deprive Noriega of his principal TV media, and to ensure prompt reception by the populace. To this end, and according to the OPLAN, Channel 2's broadcast capability was neutralized by special operations forces at approximately H-hour, and Volant Solo began

broadcasting on the frequency. The broadcast facility was shut down in such a manner as to enable prompt restoration of capabilities once the US and new Panamanian government were in full control of the situation.

The PSYOP element commenced activities by making use of the same previously prepared scripts and recordings being broadcast via Volant Solo. Soon it was heavily involved in preparing scripts and acquiring news items and music adequate to keep the Panama City area receiving Volant Solo's broadcasts and the nationwide audience receiving the AM radio station's broadcasts 24 hours per day. This was a major undertaking: Scripts would have to be developed, coordinated with the staff, and translated into acceptable Spanish so the Panamanian population would listen and understand. All of the PSYOP soldiers were actively engaged in this process. Fortunately, all were bilingual and thoroughly familiar with the situation in Panama. Tapes of popular music were available to maintain audience attention between announcements.

Safe conduct passes were prepared at and distributed by the printing facilities at the main US military print plant at Corozal. (Later versions, as well as other products, were printed on presses deployed with the PSYOP TF and on captured presses at Noriega's former PSYOP facility on Fort Amador.) It should be noted that Gen Marc A. Cisneros, CG USARSO, signed the leaflet, as opposed to CINCSOUTH (General Thurman), or CJTF-South (General Stiner). General Cisneros had already established a good reputation among the Panamanian population and the PDF, and therefore was expected to have greater credibility as a known entity. As events proved, his reputation would be a valuable commodity, not only as endorser on subsequent surrender appeals, but in personally arranging the surrender of regional PDF garrisons by telephone.

These first safe conduct passes were printed on newsprint. Three hundred thousand of them could be printed and chopped into bundles rapidly in a form that could be handled by two of the cell's PSYOP sergeants with a pickup truck. Furthermore, US helicopter crews could easily take on 30,000 or more leaflets and toss them over target areas without difficulty due to their compactness and small size. If the

Figure 2. Three hundred thousand of these safe conduct passes were printed on newsprint as an expedient. They were printed in Spanish on one side but in English on the other so that US troops understood what was being promised. These were proven effective in the early stages of Just Cause, especially when accompanied by loudspeaker broadcasts.

contingency had taken place during the rainy season, this approach might not have worked very well since the newsprint would have rapidly disintegrated on contact with water. Had heavier paper stock been used, however, the leaflets would have taken longer to print and might have been too bulky and heavy for the small detachment to handle.

These safe conduct passes were dropped by helicopter on targets of opportunity and on locations identified by PSYOP soldiers. Helicopter pilots often carried bundles of leaflets just in case an opportunity would present itself for their use. Later versions of these passes were also distributed as handouts from loudspeaker teams and other US forces.

One of the earliest indicators of effectiveness was the successful employment of loudspeakers and leaflets in support of US Marines at La Chorrera, a small village on the outskirts of Panama City and Howard AFB. The Marines had encountered heavy resistance from PDF and DIGBAT members for the first 24 hours. The Marines ceased fire for the night. Surrender appeals were then blared over loudspeakers as safe passage leaflets were dropped. Resistance ceased early the next morning without an additional shot being fired. Surrendering personnel came forward clenching the safe conduct passes.

Colocated with the PSYOP cell was the commander of the Joint Audiovisual Detachment (JAVDET), a unit comprised of multiservice elements from the Joint Combat Camera Center. Although not in command of the JAVDET, the PSYOP TF commander could request specific video coverage by the detachment. He then had a significant amount of footage already available when the main body of the PSYOP TF arrived with organic camera teams and audiovisual production capability. One copy of every cassette produced by the JAVDET was delivered to the PSYOP TF.

The JAVDET's transportation asset were extremely limited, but the PSYOP TF commander was able to match up these cameramen with several of the vehicle-mounted loudspeaker teams already in-country. It was largely the videos obtained by these photographers that were used in initial PSYOP audiovisual operations. Also, since these videos were not PSYOP products, they were provided by the JAVDET to the US media through program action officer (PAO) channels. PSYOP loudspeaker soldiers and activities therefore wound up receiving higher visibility in the US media than would have been the case otherwise.

Immediately upon activation of the 10,000-watt AM PSYOP radio station and commencement of the initial assaults on 20 December, the new president of Panama, Guillermo Endara, communicated with the Panamanian masses principally via this station. Among Endara's first announcements was the promise that anyone turning a weapon in to US forces would be paid \$150 for it.

The "money for guns" concept had been envisioned as a viable PSYOP technique to promote cessation of hostilities. Results during *Urgent Fyiry* in Grenada had been successful, even though undertaken late in the operation. In the case of Panama, the initiative was taken early; it paid off. The PSYOP radio station explained and promoted turn-in procedures to combatants and to the Panamanian population. The newly arrived PSYOP TF commenced preparation of numerous printed leaflets and posters to convey information leading not only to the rapid surrender of PDF and DIGBAT personnel, but to their turning in individuals and cached weapons as well.

Early in the operation, PSYOP soldiers supported civil military operations, including the displaced persons (DP) camp hastily established in Balboa Village. A tactical PSYOP loud-speaker team set up full-time operations in the compound and amplified PSYOP radio broadcasts over the loudspeaker system to put the people at ease and keep them informed. This team, along with other PSYOP soldiers, moved throughout the camp, handing out newspapers prepared by the PSYOP TF, pretesting proposed PSYOP products, chatting with the people, observing their actions, and reporting potential problems to the camp administrators-members of the 96th Civil Affairs Battalion.

A primary problem associated with the DP activity was rumor control. By building rapport and establishing information programs with the DPs over time, PSYOP soldiers established their credibility and were able to neutralize rumors before they expanded to crisis proportion. When an improved, expanded DP facility was completed at the Panamanian-controlled portion of Albrook Field, PSYOP soldiers helped prepare the population of the Balboa camp to minimize apprehension about the move to the new site and to enhance control during the move itself.

The tempo of PSYOP increased dramatically as time progressed and the PSYOP TF became fully operational. Additionally, the 4th PSYOP Gp commander arrived as senior PSYOP commander in-theater-serving as special PSYOP advisor and expeditor for General Thurman. The group commander used the full range of media to convey public information while soliciting cooperation and support from the

military in identifying and apprehending PDF and DIGBAT members and arms caches.

Posters, leaflets, radio broadcasts, and television announcements solicited information and provided telephone numbers to be called by those wishing to volunteer information regarding weapons or PDF and DIGBAT fugitives. These techniques were effective. Within minutes after dissemination of printed material or broadcast of the information, the designated telephones began to ring and information poured in. It was also found that new posters, especially "wanted" posters bearing photographs of PDF and DIGBAT fugitives, had to be printed and distributed continuously because people removed them from walls to avoid identification, to keep as souvenirs, or possibly take them home for study and future reference.

Other products focused on establishing a favorable image of US forces, explaining US motives, and providing information needed to reestablish the normal routine. Products of the latter category were in demand because the former PDF-dominated Panamanian media was essentially shut down. In fact, the newspapers printed by the PSYOP TF were so sought after by the public that enterprising Panamanians grabbed bundles of them and sold them to passers-by.

At this point, it should be stressed that all products were tested prior to dissemination. Product review and approval was extended to the level of the executive office of the Panamanian government in order to reduce the probability of error. (A classic example of such an error on the part of an enemy occurred during *Desert Shield/Storm* when an Iraqi propaganda announcer warned US military personnel that their wives were fooling around with movie stars such as Bart Simpson!)

A short case study is presented here for the purposes of clearly demonstrating the complexity of PSYOP product development during *Just Cause* and, later, *Promote Liberty*. During the operation, the PSYOP TF developed a product bearing the multicolored image of the Panama national seal. The insignia was surmounted by an eagle. Due to the poster's size and complexity (five colors), the prototype was assembled and sent to the Corozal print plant. The workers at the plant

remembered that they had produced similar images before the contingency and still had the master plates; they therefore used these plates. The resulting product was indeed beautifully done. Only one problem: the PSYOP TF S-3 realized that, instead of the traditional eagle atop the Panama crest, there was a North American bald eagle-not exactly the kind of thing that would make us popular!

When redone, the revised poster with correct eagle and crest, was tested again "just to be sure." Again, a problem surfaced-according to the National Code of Panama, the crest was supposed to appear in a field of green, and the proposed poster would have done just that. Unfortunately, the proposed green was the color of one party of the Panama coalition government-one which was becoming increasingly viewed by Panama political opponents as trying to muscle out the other two coalition parties.

The poster finally came out with the eagle and crest on a neutral background. The lesson here is that pretesting and posttesting, including the actual colors to be used, are fundamental to the PSYOP development and production process.

Figure 8. This small red, white, and blue poster was printed on heavy stock paper and was distributed throughout Just *Cause* and Promote *Liberty*. It was displayed on military vehicles and handed out by US troops. Its objectives were to portray US-Panamanian teamwork and to reduce perceptions of US forces as military invaders or occupiers. Within days after dissemination commenced, Panamanian commercial vendors were peddling T-shirts and other paraphernalia bearing the same logo.

This process is crucial-and testing needs to be done right. Additionally, all PSYOP campaigns and products require extensive staff coordination and personal review by the PSYOP TF commander.

As the situation further stabilized, it became increasingly important to get the commercial media "back in business." Shortly after the first day of operations, the PSYOP TF commander began to receive personal telephone calls from media representatives willing to get their TV and radio stations back on the air in support of the US and the new government-but only if they and their personnel would be escorted by US soldiers or transported under guard while their facilities were guarded by troops of the JTF. There existed considerable concern for possible terrorist acts by DIGBAT goons still at large, including possible murder or sabotage.

Initially, soldiers and vehicles could not be spared by either the PSYOP TF or JTF-South to satisfy all commercial media's conditions. Nor did the PSYOP TF have the weapons necessary to provide appropriate security. However, at about 2 100 hours the night after Noriega obtained sanctuary in the Papal Nuniciature, a team of PSYOP soldiers entered the TV Channel 2 broadcast facility and began broadcasting prerecorded tapes of cartoons from the station library. By morning, most of the commercial broadcasting crew had arrived, along with a large crowd of Panamanians enthusiastically waving Panamanian and US flags. They were celebrating the arrival of US troops and the "grand reopening" of their singing channel.

The commercial crews volunteered to restore operations as the PSYOP team temporarily observed and screened their material to ensure that it was not counterproductive to US aims or those of the new government. Another TV channel (4) was similarly reactivated the same day.

Most of the principal radio and television stations in and around Panama City were back on the air within days, temporarily under observation by or supervision of either US PSYOP personnel or Panamanian officials with whom PSYOP had established a working relationship. These media not only broadcast materials prepared by the PSYOP TF, but also prepared and broadcast excellent programs on their own. Their

programs supported US military forces and the government of Panama.

By 8 January, the PSYOP TF had produced and disseminated over one million leaflets and handbills, 50,000 posters, 550,000 newspapers, and 125,000 units of miscellaneous other printed materials. Volant Solo had conducted TV broadcasts for the first several days, the PSYOP AM radio station had been operating 24 hours a day, and countless messages had been aired on commercial radio and television stations and published in commercial newspapers. Loudspeaker teams continued to support tactical units by broadcasting advisories, interacting with the population, and providing timely PSYOP advice to US commanders.

Psychological operations figured prominently in the successful US efforts to flush Noriega out of the Papal Nunciature, where he had sought refuge. They played a significant role in establishing the Panama Public Force-the new police force designed to replace the old PDF. PSYOP teams circulated through Panama City and other population areas, assessing conditions and public attitudes, interacting directly with the public and with US combat and security forces, and resolving difficulties when they arose.

All of the first series of US PSYOP objectives were accomplished during *Just Cause*. US combat elements began to depart in early January 1990. Focus shifted to the consolidation of the new government in Panama and the restoration of the public information infrastructure. The PSYOP TF was stood down, replaced by a PSYOP support element comprised of 48 personnel.

This element, consisting of stay-behind PSYOP soldiers from *Just Cause* and a civilian analyst from the 1st PSYOP Bn, provided PSYOP support to the newly created Military Support Group. This unit then provided US military support to the government of Panama during the nation assistance and civil-military operations of *Promote Liberty*. From mid-January to the end of February, the PSYOP support element produced and disseminated more products and planned and executed more activities than all those in support of *Just Cause* combat operations.

ENTREGUE SU ARMA DE LA SIGUIENTE MONERR

Source: 1st PSYOP Battalion, US Army

Figure 9. One of many later versions, this poster not only indicates procedures for surrendering arms but also identifies turn-in locations and their hours of operation. Subsequent versions left some of the data blank so that Special Forces soldiers in the countryside could fill in the information and administer similar programs.

The highly efficient and productive mini-task force increasingly worked in conjunction with the new government, the commercial media, the US Embassy, the Military Support Group, and JTF-Panama to create conditions favorable for restoring democracy, the economy, and public security. Major emphasis was placed on these objectives:

- Maintaining support for US objectives in Panama.**
- Professionalizing the newly formed Panama Public Force and Panamanian Police Force (PNP)-constituted principally by former members of the PDF.**
- Gaining public support for the Public Force and PNP.**
- Enhancing the effectiveness and prestige of the new government.**
- Neutralizing disinformation and hostile propaganda directed against the government, the Public Force/PNP, and the US.**

By the end of February, these PSYOP soldiers had been redeployed to Fort Bragg. They were replaced by 8th PSYOP Bn soldiers augmented by linguists and area experts from the 1st PSYOP Bn and by camera and audiovisual technician teams from the 4th PSYOP Gp's Strategic Dissemination Company. This group continued operations, employing the full range of dissemination media, until stood down in May 1991. The final PSYOP objectives envisioned for Panama contingency operations had been accomplished.

From beginning to end, PSYOP supported all stated US military and political objectives. During the initial stages of the assault, PSYOP loudspeakers, leaflets, TV and radio announcements successfully appealed for cessation of hostilities; surrender of weapons and members of the PDF and Dignity Battalions; and compliance with measures promulgated by the newly formed Panamanian government. Psychological operations enhanced credibility of US military forces, assisted in gaining and retaining popular support for US actions, and helped reduce the potential for damaging disinformation and hostile propaganda.

As the operation progressed, psychological operations and PSYOP forces were fully integrated into consolidation operations and emergency relief activities while fostering an

Source: 1st PSYOP Battalion, US Army

Figure 10. The PSYOP support element coordinated directly with JTF-PM, ground forces, other elements within the MSG, the Panamanian government, and the US Embassy.

atmosphere of return to normalcy. Announcements via US military PSYOP and commercial news media supported this process. Through programs and information developed or disseminated by PSYOP soldiers, 193d SOG Volant Solo technicians, and host-nation affiliates, Panamanians knew when and where to go to satisfy their fundamental needs. Through this process, PSYOP supported not only the theme of legitimacy of the US operation, but also the legitimacy of the newly formed government of Panama.

During the final phase of military operations, US PSYOP supported an orderly return of control to the host-nation government, addressed major sanitation and health threats, and continued military information programs. All of this facilitated prompt return of the deployed US military personnel to CONUS.

Finally, as a natural consequence of these accomplishments, psychological operations and PSYOP units gained recognition among many important US commanders of combat and combat support units participating in the operation. Not only did PSYOP affect them personally by assisting in the reduction of casualties

and damage on both sides, but also assisting in presenting the most favorable image of their commands to the Panamanian population and to the world.

Many of these accomplishments cannot be measured in quantifiable terms. However, there were obvious indicators of success:

- surrender of enemy forces after exposure to loudspeakers and leaflets;
- immediate public response to posters, loudspeakers, and TV/radio announcements, resulting in valuable information and intelligence;
- civilian compliance with instructions conveyed via PSYOP media;
- virtual absence of hostile propaganda and disinformation which could have obstructed the mission; and
- prompt restoration of commercial information services, which contributed to the legitimacy of the new democratic government.

Many valuable lessons were learned by the PSYOP community itself:

- The PSYOP TF commander simultaneously serving as JTF PSYOP officer, theater PSYOP officer, and PSYOP TF commander enhanced initial planning and coordination. As the operation progressed, however, these duties overextended the capabilities of the commander to the extent that he encountered difficulty supervising and controlling the many disparate and geographically separated PSYOP elements and operations.
- The requirement that PSYOP TF simultaneously provide JTF staff support, control tactical assets, and develop and disseminate PSYOP products stressed the capabilities of the task force to the breaking point. The battalion staff and company configurations did not easily adjust to the requirements of a task force much larger and more complex than experienced before. Of particular concern was an inability to control the tactical PSYOP teams, which were vital to successful PSYOP campaign planning and evaluation. Attaching these teams OPCON to combat commanders while optimizing on-site responsiveness during the assault phase detracted from

overall PSYOP TF performance during consolidation activities. These teams should have reverted to a direct support status under operational command of the PSYOP TF as soon as that force had the ability to fully exercise that function. Unfortunately, that capability did not materialize until the majority of the teams had returned to the US.

- Augmentation from other battalions of the 4th PSYOP Gp was essential to the success of the PSYOP TF. However, due to the peacetime configuration and functioning of the group, which only occasionally involved an integration of effort across battalion lines, the full talents and capabilities of soldiers and equipment were extremely difficult to exploit in Panama.

- The L-Peries modified table of organization and equipment (MTOE) for the 4th PSYOP Gp and its subordinate units was not optimally suited to requirements of the contingency.

Some of the "good things" that were either learned or reinforced are listed below.

- Early integration of PSYOP into the contingency planning process helped ensure overall success of the operation.

- Tactical loudspeaker teams contributed to demoralization of the PDF and DIGBATs and to cessation of hostilities and surrender. The teams used prepackaged scripts and recordings, but frequently employed their own ingenuity and linguistic capability "on the spot" to deal with both hostile forces and the civilian population. Tactical commanders of Army forces, Marine Corps forces, and Navy SEAL forces placed considerable importance on these teams.

- The Panama population listened to, and complied with, instructions and advisories from US military PSYOP TV, AM radio, and loudspeaker broadcasts.

- The working relationship that the 4th PSYOP Gp commander and the 1st PSYOP Bn commander enjoyed with the XVIII Airborne Corps commander and stag, and with CINCSOUTH and his staff prior to Just Cause and Promote Liberty, undoubtedly resulted in a degree of understanding and trust which were critical to the success of joint PSYOP throughout the contingency operation.

- Psychological operations soldiers and airmen were well trained, motivated, self-confident, and effective.

Certainly, some of the problems and some of the "success stories" were situation dependent and can never really be formalized. However, in June 1991-less than six months after the Panama contingency was executed and only weeks after return to CONUS by the last 8th PSYOP Bn members of the PSYOP Support Element-the 4th PSYOP Gp was provisionally reorganized. Regionally oriented battalions remained, but the group was now organized according to an operational concept suitable for a wide variety of contingencies.

The reorganized 4th's basic tenets:

- **The 4th PSYOP Gp commander would deploy to the theater headquarters, along with a small headquarters element, to provide PSYbP advice and assistance to the supported theater CINC and act as "expeditor" for PSYOP-related actions. (This happened informally in Panama, when the 4th PSYOP Gp commander performed this function not only for the PSYOP TF but also for the 96th Civil Affairs Bn, the 112th Signal Bn, and the 528th Support Bn-three units which were at that time under the 4th's peacetime command and control. The concept proved so beneficial to both the PSYOP TF and to CINCSOUTH that it was formalized.)**

- **The PSYOP TF would continue to be commanded by the theater PSYOP battalion commander, but with two other PSYOP battalion commanders working for him:**

1. **A tactical commander (the commander of the reconfigured 9th PSYOP Bn) would control all PSYOP loudspeaker teams and other tactical PSYOP assets and ensure support to other tactical elements of the JTF. The 9th PSYOP Bn would train for these support missions worldwide.**

2. **A media production commander (the commander of the new provisional PSYOP Dissemination Bn) would produce all printed products, recordings, and audiovisual products, and would run all radio and television broadcast operations.**

Since the 4th PSYOP Gp would now be provisionally organized to operate the same in peacetime as in war, it was presumed that overall effectiveness of contingency PSYOP would improve.

The opportunity to validate the new concept presented itself sooner than anyone could have expected. Within one month

after the 4th PSYOP Gp's reorganization, Iraqi forces invaded Kuwait. When PSYOP forces deployed to Saudi Arabia, they did so in the configuration described above. It worked, and worked well! It is estimated that 29 million leaflets and many hours of loudspeaker and radio broadcasts During *Desert Shield* and *Desert Storm* resulted in thousands of Iraqi soldiers being influenced by PSYOP to abandon their positions and equipment and to surrender.

One can only speculate on what might have been the results had PSYOP forces not participated in these contingencies, but the indicators of success are pretty clear. In the author's opinion, these successes are a tribute to the PSYOP soldiers, civilians, and airmen-past and present-whose competence, dedication, and ingenuity most certainly saved US and Panamanian lives and contributed to mission success. Their accomplishments have resulted in increased recognition of the value of PSYOP by senior military commanders and their staffs, and by other agencies of the US government. However, this renewed interest and understanding is highly perishable. We still have a long way to go before the potential of strategic, operational, and tactical PSYOP-and the forces which plan and execute these operations-is fully realized.

Psychological Operations

in Action

Poland's Underground Media

Laurence J. Orzell

Poland offers a fascinating example of nongovernmental psychological operations in action. Drawing upon that country's long tradition of a conspiratorial press, dissidents affiliated with the banned Solidarity trade union and other organizations engaged in the large-scale production of underground newsletters, leaflets, books, and other printed materials designed to influence popular perceptions. The dissidents also utilized electronic media such as radio and cassettes.

Those activities reflected a broad range of antiregime opinion, but their overall purpose was twofold: to supply uncensored information on political, social, and economic issues, and to maintain a spirit of opposition among the populace. While the dissidents would probably have described their efforts as purely informational or journalistic, their activities could accurately be described as peacetime, non-governmental PSYOP. This article places the Polish opposition's PSYOP efforts within their historical context but focuses on the period following the imposition of martial law (December 1981). In particular, the analysis examines the type of underground print materials produced, the means used to prepare and disseminate them, the government's response, the main themes the dissidents sought to propagate, and the opposition's use of electronic media. The article concludes with an assessment of the overall significance of those efforts.

The Polish resistance, whether directed against czarist Russia, Nazi Germany, or native communist rulers, recognized the value of PSYOP. When the Poles revolted against Russia in January 1863, they formed a conspiratorial government that not only conducted urban guerrilla warfare; it also organized an underground press which contained manifestos directed at

Poles, Lithuanians, Byelorussians, and Ukrainians. Although this effort failed, it contributed to the maintenance of armed resistance. The underground media played a much greater role during World War II. The Home Army (*Armia Krajowa*), Poland's chief resistance group, regularly published an *Informational Bulletin* (*Biuletyn Informacyjny*), copies of which circulated from hand to hand and thus indirectly supported diversions and armed opposition to the Nazis. Other groups, ranging from the far right to the extreme left on the political spectrum, also produced leaflets (*ulotki*) and other publications. So extensive was this network that the London-based Polish government-in-exile issued a postage stamp in 1943-itself a form of PSYOP-commemorating the underground press (*prasa podziemna*).

Armed resistance to foreign domination proved impractical following the communist consolidation of power after World War II, but dissident psychological operations eventually came to assume even greater importance. Antiregime intellectuals benefited from their government's reluctance to engage in extensive repression during the 1970s-lest Poland risk losing the economic benefits of detente-and they established a variety of illegal publishing ventures. One group in particular, the Workers' Defense Committee (later renamed the Social Self-defense Committee), distinguished itself through its publications: *Communique* (*Komunikat*), *Information Bulletin* (*Biuletyn Informacyjny*), and *The Worker* (*Robotnik*). Dissidents also set up an Independent Publishing House, better known by its Polish acronym NOWA, which produced numerous literary works and several periodicals. Despite periodic harassment by the authorities, NOWA and similar illegal publishing enterprises prepared materials targeted at laborers, students, farmers, and other social groups. There can be little doubt that these publications, which advocated political pluralism and respect for human rights, helped forge the broad social alliance which led to the formation of Solidarity during July and August 1980.

Both the regime and the workers used PSYOP extensively during the 1980 strikes. For instance, when the authorities distributed leaflets questioning the striker's motives, the workers responded with broadsheets of their own, counseling

resistance in the face of what they termed government disinformation. The government's acceptance of the strikers' "Twenty-one Demands" effectively extended legal recognition to unofficial publishing activities. The subsequent "Gdansk Agreement" obliged the regime "to respect freedom of speech and ... not to suppress independent publications." Solidarity quickly took advantage of this unprecedented concession. The union published its own national organ, *Solidarity Weekly* (*Tygodnik Solidarnosci*), and regional branches followed suit with a plethora of journals and newsletters. The union press both reflected and shaped the popular perception that the government could not be trusted to carry out the Gdansk accord. Not surprisingly, these publications represented one of the principal targets of repression when the authorities declared martial law on 13 December 1981.

Despite internment, arrests, and confiscations, the underground press quickly reappeared and assumed an even greater importance due to the fact of dissatisfaction. Some activists who were placed in internment camps in 1981-82 even managed to produce handwritten newsletters. For instance, internees at a detention camp in Nowy Lupkow prepared several issues of a newsletter entitled *Our Bars* (*Nasza Krata*), named after the prison bars which isolated them from society. Copies of *Our Bars*, reportedly circulated outside the camp, counseled the maintenance of worker-intellectual ties in the face of government repression. The vast majority of underground publications produced during and after martial law emanated from small groups of individuals in larger cities and towns who had avoided capture. The importance of these PSYOP efforts in dissident strategy became clear when Solidarity's underground Provisional Coordinating Committee issued a declaration in 1982, stressing the need to "organize the independent circulation of information" and thereby "expose the propaganda goals of the authorities."

The underground press produced nearly 1,000 different periodicals, approximately 400 of which appeared repeatedly, some on a regular basis. While it is difficult to estimate the total readership, the sheer number of publications suggests that these materials enjoyed wide circulation, primarily in urban areas. During the first four months of martial law, the
